Dr George Grey Turner, emeritus professor of surgery at the universities of Durham and London, died in London Aug 24 aged 73 He was a member of the council of the Royal College of Surgeons of England from 1926 to 1950 In 1949 he presided over the 13th congress of the International Society of Surgeons in New Orleans Among the notable lectures he had given in this country were his oration at the clinical congress of the American College of Surgeons in Philadelphia in 1930, his Prosser White Oration in 1939, the George Halliburton Hume Memorial Lectures in 1943, and in 1949 the Moynihan Memorial Lecture Among his publications are Injuries and Diseases of the Oesophagus" In addition, he wrote several treatises on cancer

MEETINGS

American Fracture...

American Academy of Ophthalmology and Otolaryngology Chicago Oct. 14-18 Dr W L Benedict 100 First Avenue Bldg. Rochester Minn Executive Secretary

American Academy of Pediatrics Toronto Canada Oct 20-25 Dr E H Christopherson 636 Church St Evanston Ill Executive Secretary

American Association for the Surgery of Trauma The Seigniory Montebello Quebec Canada Oct. 23-25 Dr Charles G Johnston 1512 St. Antoine St Detroit 26 Secretary

American Association of Blood Banks Hotel Nicollet Minneapolis Oct. 22 24 Miss Marjorie Saunders 3301 Junius St Dallas 1 Texas Secretary

American Cancer Society New York Oct. 25 Dr Charles S Cameron 47 Beaver St New York Medical Director

American Clinical and Climatological Association Skytop Pa Nov 5-7 Dr Marshall N Fulton 124 Waterman St Providence R I Secretary

American College of Surgeons Fairmont Hotel San Francisco Nov 5 9 Dr Michael L Mason 40 E Erie St. Chicago 11 Secretary

American Hospital Association St. Louis Sept. 17 20 Mr George Bugbee 18 E. Division St Chicago 10 Executive Director

American Medical Writers Association Pere Marquette Hotel Peoria Ill Sept. 19 Dr Harold Swanberg 209 W C U Bldg. Quincy Ill Secretary

American Public Health Association Civic Auditorium San Francisco Oct 29 Nov 2. Dr Reginald M Atwater 1790 Broadway New York 19 Executive Secretary

American Roentgen Ray Society Washington D C Sept 25 28 Dr Barton R. Young Germantown Hospital Philadelphia 44 Secretary

Amercan Society for the Study of Arteriosclerosis Chicago Nov 4-5 Dr O J Pollak Quincy City Hospital Quincy 69 Mass Secretary

American Society of Anesthesiologists Washington D C Nov 5-8 Dr J Earl Remlinger Jr 188 W Randolph St. Room 909 Chicago 1 Secretary

American Society of Clinical Pathologists Chicago Oct. 15 20 Dr Clyde G Culbertson 1040 W Michigan St. Indianapolis 7 Secretary

American Society of Maxillofacial Surgeons Drake Hotel Chicago Sept. 23 26 Dr Casper M Epsteen 25 E Washington St Chicago 2 Secretary

Association of American Medical Colleges French Lick Springs Hotel French Lick Ind Oct. 29 31 Dr Dean F Smiley 185 N Wabash Ave Chicago 1 Secretary

Association of Life Insurance Medical Directors of America New York Oct 11 12. Dr Henry B Kirkland P O Box 594 Newark 1 N J Secretary

Association of Military Surgeons of the United States Palmer House Chicago Oct. 8 10 Colonel James M Phalen Armed Forces Institute of Pathology Washington 25 D C Secretary

Central Neuropsychiatric Association Hotel Nicollet Minneapolis Oct 19 20 Dr Lee M Eaton 102 Second Ave S W Rochester Minn. Secretary

Central Society for Clinical Research Drake Hotel Chicago Nov 2 3 Dr Kenneth G Kohlstaedt 960 Locke St Indianapolis 7 Secretary

College of American Pathologists Chicago Oct. 15 16 Dr Tracy B Mallory Massachusetts General Hospital Boston Secretary

Colorado State Medical Society Denver Sept 18 21 Mr Harvey T Sethman 1612 Tremont Place Denver 2 Executive Secretary

DEATHS

Sloan, Ruell Allen ⊕ Washington, D C , born in Hartford, Conn , July 31, 1908, University of Rochester School of Medicine and Dentistry, Rochester, N Y, 1935, specialist certified by the American Board of Pathology secretary treasurer of the American and Canadian sections of the International Association of Medical Museums, past vice president and president of the Washington Society of Pathologists, formerly secretary of the Pathological Society of the District of Columbia member of the American Association of Pathologists and Bacteriologists, College of American Pathologists, and the American Society of Clinical Pathologists, assistant in pathology, 1937-1938 instructor in pathology, 1938-1939 and from 1941 to 1942 at Harvard Medical School in Boston, at one time instructor and acting assistant professor of pathology at St. Louis University School of Medicine, assistant professor of pathology, University of Buffalo School of Medicine, during World War II served as executive officer of the Army Institute of Pathology formerly affiliated with Long Island and Children's hospitals in Boston, St Marys and Firmin Desloge hospitals in St Louis, and the Edward J Meyer Memorial Hospital in Buffalo, curator of the Medical Museum Department of the Armed Forces Institute of Pathology, died in his home in Chevy Chase, Md , June 17, aged 42.

Roper, Lonsdale Joseph ⊕ Richmond, Va , born in New York March 28, 1886, University College of Medicine, Richmond, 1907, since 1946 state health commissioner, in 1919 began his career in public health with the establishment of Portsmouth's first city health department, in 1937 became director of the venereal disease division of the state health department and the next year was put in charge of the department s rural health division, specialist certified by the American Board of Preventive Medicine and Public Health member of the Southern Medical Association and the Richmond Academy of Medicine, fellow of the American Public Health Association and past president of the State and Provincial Health Authorities of North America, served during World War I at one time assistant professor of preventive medicine and public health at the Medical College of Virginia, died June 12, aged 65, of coronary thrombosis

Martin, Harry Watson ⊕ Los Angeles, born in Redfield, S D , Jan 18, 1890, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois 1912 husband of Columnist Louella O Parsons member of the American Urological Association, fellow of the American College of Surgeons, served during World War I and in the South Pacific during World War II, formerly served on the state athletic commission and the Los Angeles Board of Civil Service Commissioners, chief of the medical department at 20th Century Fox Studios, member of staff, California and Queen of Angels hospitals, senior urologist, Presbyterian Hospital Olmstead Memorial, Los Angeles County Hospital, and Cedars of Lebanon Hospital, where he died June 24, aged 61, of lymphosarcoma

Stone, Murray Chaffee ⊕ Springfield, Mo , born in Leominster, Mass , in 1880, Harvard Medical School Boston, 1903, specialist certified by the American Board of Pathology, member of the College of American Pathologists and the American Society of Clinical Pathologists past president of the Greene County Medical Society, sheriff and formerly county coroner, in 1912 and 1913 state bacteriologist for the state board of health, served during World War I consultant for the Medical Center for Federal Prisoners attending pathologist for the Veterans Administration Hospital, pathologist for the Springfield Baptist Hospital, City Hospital, and St Johns Hospital, where he died June 12, aged 71, of gastrointestinal hemorrhage

Brown, Hubert Leslie ⊕ Hinsdale, N H , Baltimore Medical College, 1903, affiliated with Memorial Hospital in Brattleboro and Elliot Community Hospital in Keene, died June 24, aged 76, of coronary thrombosis

Burden, Verne Gerard ⊕ Philadelphia, University of Pennsylvania School of Medicine, Philadelphia, 1919, certified by the National Board of Medical Examiners fellow of the American College of Surgeons, medical director of the Eastern State Penitentiary Hospital, chief of staff of Our Lady of Lourdes Hospital in Camden, N J , served on the staff of St Joseph's Hospital, formerly fellow in surgery at the Mayo Foundation in Rochester, Minn , died June 23, aged 56

Burnett, Charles Borromeo, South River, N J , Hahnemann Medical College and Hospital of Philadelphia, 1893, died May 12 aged 79, of chronic myocarditis

Gannon, Clarence Peter Lee, Kingston, N Y , University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1916, past president and for many years secretary of the Ulster County Medical Society, member of the Association of Military Surgeons of the United States, served during World War I, for many years health officer of the town of Ulster, affiliated with Kingston and Benedictine hospitals, died June 22, aged 67

Gousse, William Louis ⊕ Fairfield Me , Baltimore Medical College, 1911, past president of the Kennebec County Medical Association, served as school physician and health officer of the town of Fairfield, affiliated with Thayer Hospital and Sisters' Hospital in Waterville, where he died June 16, aged 73, of cerebral thrombosis, and diabetes mellitus

Greenstein, Harry ⊕ New York, University and Bellevue Hospital Medical College, New York, 1899, affiliated with New York Polyclinic Medical School and Hospital, died in Hunts Point Hospital May 25, aged 74

Griffin, Fred, Mexico, Mo , Washington University School of Medicine, St Louis, 1904, member of the American Medical Association, past president of the school board, affiliated with Audrain Hospital, died June 20, aged 70, of heart disease

Hayden, Louis Brooks ⊕ Livermore Falls, Maine, Tufts College Medical School, Boston, 1897, an Associate Fellow of the American Medical Association, served during World War I, formerly school physician in Plymouth, Mass , died June 12, aged 76, of pneumonia

Jones, Frederick Goodwin ⊕ Utica, N Y , Syracuse University College of Medicine, 1909, specialist certified by the American Board of Otolaryngology, member of the American Academy of Ophthalmology and Otolaryngology past president of the Utica Academy of Medicine, served overseas during World War I affiliated with St Luke's Home and Hospital, St Elizabeth, Faxton, Utica State, and Masonic Soldiers and Sailors Memorial hospitals, died June 5, aged 67, of coronary occlusion

Schneider, Harry ⊕ New York, Boston University School of Medicine, 1922, specialist certified by the American Board of Obstetrics and Gynecology, fellow of the American College of Surgeons on the staff of Beth Israel Hospital died April 20, aged 54 of cerebral thrombosis

Simmons, George W., Ripley, W Va , Maryland Medical College Baltimore, 1903, for many years director of the bank of Ripley, died June 11, aged 72, of carcinoma

Smullen, James Joseph Jr., Wisconsin Rapids, Wis , Loyola University School of Medicine, Chicago, 1934, member of the American Medical Association, affiliated with Riverview Hospital, died June 12, aged 42, as the result of a fall

Stone, Eustace B., Roanoke, Va Medical College of Virginia, Richmond, 1893, on the staff of Shenandoah Hospital, died April 17, aged 83, of coronary embolism

Wood, James William, Hanceville, Ala , Southern Medical College, Atlanta, 1897, died in Birmingham May 3, aged 78, of hypostatic pneumonia and arteriosclerosis

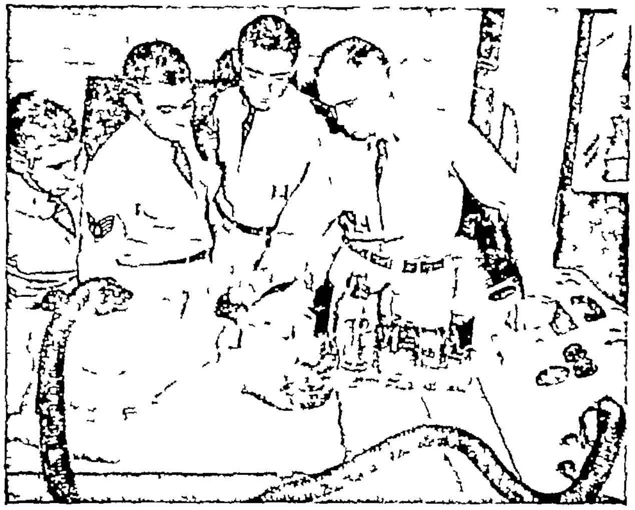
⊕ Indicates Fellow of the American Medical Association

GOVERNMENT SERVICES

AIR FORCE

Air Evacuation Units Trained to Use Respirators—A course in the operation, maintenance, and theory of all types of portable respirators, believed one of the first of its kind offered in the field, is now being given to selected personnel of the 1453rd Medical Air Evacuation Squadron at Hickam Air Force Base, Oahu, T H Highly qualified instructors of the unit, using working models of the respirators and conventional iron lung, are instructing 12 airmen, eight hours a day, five days a week, in this specialized field Each class lasts 30 days, and the training is so thorough that graduates know how to correct any mechanical failures that might occur The project is supervised by Comdr Karl R Whitney, deputy surgeon of PACD, Military Air Transport Service

Effective with victims of polio and spinal afflictions, the respirators can be used in either type C 54 or C-97 type aircraft of the 1500th Air Transport Wing now used in flying the Pacific airlift for MATS



Medical officer demonstrates operation of portable respirator for use in planes of air evacuation units

Aeromedical School Survey—Almost 80% of the work done at the Air Force School of Aviation Medicine is devoted to research on the medical problems of flight, according to a survey made by Col Frederick J Frese Jr, deputy commandant of the school A trifle more than 16% of the school s effort is required at present to train Air Force doctors in the special techniques of aviation medicine A scant 4% of its energies are expended on the clinical practice of medicine The survey findings cover only the activities of the aeromedical school headquarters at Randolph Field Because of the heavy demand for more medical personnel in the Air Force, training of flight nurses and enlisted technicians was transferred last year to a branch of the school at Gunter Air Force Base in Alabama The Gunter branch is reporting its manpower requirements separately The results of the survey will be used to determine the size of the staff needed to operate the School of Aviation Medicine during the next academic year

New Assignments—Five officers left the Randolph Field School of Aviation Medicine Aug 15 for permanent duty at other bases Lieut Col David S Evans, head of the department of neuropsychiatry since 1949 Capt George W Ell, assistant to the chief of the clinical medicine group since 1948, and Lieut Paul B Mullin assistant in psychology all received overseas assignments Col Ernest J Cone was assigned to the Surgeon General s office in Washington, while Maj Virgil R Zarling goes to axwell Air Force Base, Alabama

PUBLIC HEALTH SERVICE

Find Encephalitis Virus in Birds, Insects—A research team of the Public Health Service's Communicable Disease Center has isolated the virus of encephalitis from wild birds under natural conditions, in a series of field tests in Weld County, Colo The Laboratory work was performed at the Communicable Disease Center at Montgomery, Ala "It has been suspected for many years that birds harbor the virus, but this is the first time that their role definitely has been proven," said Dr T Aidan Cockburn, epidemiologist in charge of encephalitis studies in the Office of Midwestern CDC services

Isolation of the virus was reported twice from redwing blackbirds, and once from magpies, as well as from two batches of mosquitoes and one group of mites Dr Cockburn points out that wild birds, now proved to harbor the virus, do not become "sick" but act only as carriers, from which mosquitoes can acquire the virus PHS figures show that the incidence of encephalitis in the United States increased in 1950 for the second straight year In 1948 there were 575 reported cases, in 1949, 781 cases, and in 1950, 1,051 cases Dr Cockburn said the increase possibly was a result of better recognition of the disease However, he further said, "Many thousands more are believed to have gone unrecognized or to have been erroneously diagnosed as poliomyelitis '

The Colorado State Department of Public Health and the Weld County Health Department cooperated in the research program The public health team was comprised of a physician, an ornithologist, two entomologists, a nurse, a veterinarian, and virologist

Safe Milk Communities—Fifty four communities have been added to the list of safe milk communities, which is issued semiannually by the Public Health Service, and 21 communities on the previous list have been dropped The new listing includes 211 cities and counties and is for the period of July 1949 to June 1951, inclusive The ratings made by state milk sanitation authorities and reported to the Public Health Service are based on the Public Health Service Milk Ordinance which has been adopted by 369 counties and 1,492 municipalities in 39 states A community must receive a rating of at least 90% for a two-year period by the state authority to be eligible for the 'honor roll The ratings are concerned with health of dairy cattle, sanitary methods of handling milk, proper cooling, and adequate pasteurization

The semiannual list is published as a measure to encourage the maintenance of a high level of sanitation among communities which have adopted the Public Health Service Ordinance A separate list is compiled for communities in which both raw and pasteurized milk are sold No comparison is intended with communities operating under other milk ordinances The current list appears in the Aug 24, 1951, issue of *Public Health Reports*

Civilian Health Requirements Officer—Sanitary Engineer Director Wesley E Gilbertson, executive officer of the Public Health Service's Communicable Disease Center at Atlanta has been designated chief of the service s division of civilian health requirements Mr Gilbertson will be in charge of carrying out those claimant functions that have been assigned by the Defense Production Authority to the Federal Security Administrator and delegated by him to the Public Health Service These relate to the construction requirements of hospitals and health centers and to supplies in the health field including those needed by hospitals, health departments, private practitioner clinical laboratories, and industrial clinics Mr Gilbertson will be assisted by Mr Charles Lavin, also of the Communicable Disease Center, who has been coordinator of the program since its inception

Grants—The National Institute of Arthritis and Metabolic Diseases established by Congress last year as one of the National Institutes of Health, has awarded 24 grants, totalling $314 465 to nonfederal medical scientists for special study in this field

FOREIGN LETTERS

SPAIN

Congress of Spanish Cardiologists.—The third National Congress of the Spanish Society of Cardiology was held in Valencia Dec 5 8, 1950 Prof Dr F Rodriguez Fornos dean of the Faculty of Medicine of Valencia, was the president Official topics were (1) treatment of cardiac insufficiency, (2) congenital heart diseases, and (3) unipolar leads in electrocardiography Speakers on the first topic were Professors M Beltran Baguena (Valencia) and T Alday Redonnet (Madrid) Beltran Baguena reviewed the treatment of cardiac insufficiency Drs D A Gonzales Cruz, J Baguena Candela, D V Sorribes and D V Tormo, collaborators of Prof Beltran Baguena, discussed the treatment of cardiac insufficiency Dr Baguena Candela reviewed surgical treatment of congestive cardiac insufficiency Drs E Alcala Llorente and Martinez Ramon dealt with the more adequate treatment of geriatric cardiac insufficiency The studies of Prof Beltran Baguena and collaborators were based on clinical observations of 662 cases in 426 cases of left cardiac insufficiency 19 cases of right cardiac insufficiency 211 cases of total cardiac insufficiency, and six cases of nonspecific heart disease mainly cardiac neuroses

Prof T Alday Redonnet has published some 40 papers based on his pharmacologic studies of digitalis in Spanish medical journals He spoke about the clinical application of the drug on the basis of experimental results The Hatcher-Magnus method of digitalis assay may yield grossly erroneous results In 1927 he found that a Spanish digitalis containing 16 cat units per gram was practically inactive when administered to patients however, these patients improved rapidly after administration of 1 mg of digitoxin He later assayed Digitalis lanata and found it very active However, clinical results were poorer than results with the standard digitalis On the other hand when he assayed the Digitalis thapsi of Spain he found that it was only slightly more active than Digitalis purpurea However when administered to patients it was three or four times more active than Digitalis purpurea

In 1933 he submitted an extensive report on the subject to the Committee of Biologic Standardization of Drugs of the League of Nations In the report he called the attention of the committee to the unreliability of this method However, the report was not published by the committee In 1932 he suggested a method of bioassay of digitalis that should give results applicable to the clinical administration of the drug He maintained that methods in which frogs, rabbits guinea pigs and pigeons are used are of no value Only the methods in which cats and dogs are used are reliable, provided that the drug is given to the animals by the same route of administration as that used clinically The cumulative power of the drug must also be borne in mind

Prof Alday Redonnet described the activity of 58 glycosides and genins, as measured either by the Hatcher-Magnus method or by his own method Of the galenical preparations, digitalis injection is of very low activity Preparations of Adonis vernalis scilla, and several types of strophanthus are of low activity when administered by mouth However, when given intravenously they have effects similar to those obtained with digitoxin and with intravenous use of lanatoside C Digitalin and digitoxin are of value when administered orally, since they are almost completely absorbed by the intestine Digitoxin is more active when it is injected slowly than when it is injected rapidly Convallatoxin, ouabain and oleandrin do not increase in toxicity when they are injected slowly

The speaker discussed the various hypotheses concerning the mechanism of action of digitalis on circulation The toxicity of glycosides containing sulfhydryl groups does not diminish when those compounds are given either in association with or after intravenous injection of dimercaprol (BAL)

Dr A Lamelas head of the department of cardiology and endocrinology of the Casa de Salud Valdecilla (Santander), spoke on congenital heart disease He reviewed the embryology, classification of congenital heart disease, and the general methods of diagnosis with special reference to intracardiac catheterization, angiocardiography and electrocardiography He discussed the frequency and etiology of congenital heart diseases and reviewed 130 necropsies Common pathologic features of congenital heart disease are bacterial endarteritis or endocarditis imperfect physical development, tuberculosis, and congenital abnormalities Dr Lamelas discussed also, cyanosis and anoxemia and the possibility of sudden death

Dr A Duque Sampayo (Madrid) head of the department of cardiology of the Institute of Medical Pathology of which Dr Maranon is director spoke on unipolar leads in electrocardiography Classic bipolar leads give information only of the changes of position of the heart in relation to the anteroposterior axis whereas the unipolar leads from the extremities and Wilson s precordial leads give complete account of the changes of position of the heart in relation to its three axes Unipolar leads are confirmatory in the diagnosis of ventricular hypertrophy since they give clear electrocardiographic data showing especially the increased time of the intrinsic deflection Standard leads do not give diagnostic data in 50% of the cases of myocardial infarct Unipolar leads have clarified greatly the problems of bundle branch block They show the origin of extrasystoles and may eventually clarify the problem of complete arrhythmia

BRAZIL

Curative Action of Chloramphenicol and Dihydrostreptomycin in Frambesia Tropica—Dr F Nery Guimarães of the Oswaldo Cruz Institute reported the results of the treatment of yaws (frambesia tropica) with chloramphenicol and dihydrostreptomycin (five and four cases respectively) Chloramphenicol was administered orally for 10 days with a total of 10 gm in four cases and 20 gm in one case The daily total was divided into two doses The period of treatment with dihydrostreptomycin was also 10 days with a total of 10 gm divided into 20 intramuscular injections The results were reported together for the two groups as they were comparable Clinical cure was obtained between 10 and 20 days from the beginning of treatment Spirochetes were usually no longer present 48 hours after the beginning of treatment, however, in one case the organisms were present even after 72 hours A positive serologic reaction was reported in four cases (two in each group) immediately after the beginning of treatment but in all cases the results changed to completely negative The authors are entirely satisfied with the first results of treatment

Early Diagnosis of Pregnancy and Heterogenetic Reactions with Proteus OX19.—The frequency of a positive agglutination test with the strain Proteus OX19 in serums of normal and nonpregnant women led Dr Maria I Mello of the Oswaldo Cruz Instituto to investigate the influence of the blood groups on this reaction As the specific substance in the chemical composition of blood group A is closely related to that of gonadotropic hormones and of Proteus OX19 it might be possible to find some correlation between blood group and Proteus OX19 agglutination The results of the investigation disclosed that Proteus OX19 agglutinates only with blood group A serum, the highest agglutination titer being 1 80, while with the serum of pregnant women the titers are in almost all cases higher than this An attempt is being made to perform the test with the isolated polysaccharides instead of the 24-hour Proteus OX19 culture In cases of suspected pregnancy with a low agglutination titer, it is necessary that one know the blood group to assure the value of the agglutination test for diagnosis Normal serums belonging to the other blood groups gave negative results under Dr Mello s experimental conditions

CORRESPONDENCE

ORTHOPEDICS AND INDUSTRY

To the Editor:—The article by Dr. Billig relating to Industrial Orothopedics, published in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, July 28, 1951, should not be allowed to pass without comment and question. The article, if accepted as representative of modern American orthopedics, would indicate that most advances in our specialty in recent years have been wrongly conceived and ill advised.

Dr. Billig, by insinuation at least, classifies every physical complaint of the man in industry as due to some postural soft tissue abnormality which can be miraculously corrected by a few simple exercises performed three times daily. He does not even mention the many possible etiological factors which must be considered in the differential diagnosis of these problems. Any industrial concern which blindly follows such a program will force many of its employees to seek medical care outside of their own facilities for relief of those symptoms which arise from true organic lesions. In fact, the majority of complaints which could be satisfactorily managed with the regimens described by Dr. Billig would undoubtedly be functional in character.

I think it should be clearly stated that the opinions expressed by Dr. Billig may not represent the attitude of the average orthopedic surgeon toward the problem of medical care in industry.

H. R. MCCARROLL, M.D.,
3720 Washington Blvd., St. Louis 8.

To the Editor:—In THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, July 28, 1951, page 1179, there appeared an article by Dr. Harvey E. Billig Jr. of Los Angeles, entitled "The Specialist Looks at Everyday Medical Care in Industry: Orthopedics." In this he states: "Chronic posture habit results in shortening of the fascial ligamentous fibrous structures to accommodate the posture maintained. When this is occupational, and when the occupational posture habit becomes the chronic posture habit, the gradually ensuing contractural stiffness results in not only a poor posture habit but symptoms as well. The management of a telephone company noticed a huge prevalence of backache, dysmenorrhea, and occipitocervical headaches radiating to the temporal region among the thousands of girls seated with forward thrust of head and neck at switchboards. Examination revealed a contracture of the ligaments in the cervical region and in the lower back region, radiating to the anterior pelvis, thence to the leg and iliotibial-band attachment at the lateral condyle of the tibia. In these girls the forward thrust of head and neck and the forward tilted pelvis had thus become a fixed posture habit. Placing an additional pull on the contracted ligaments in the neck by means of forced craniocervical rotation exacerbated the headache radiating up over the head into the peripheral distribution of the greater and lesser occipital nerves. After mobilization of this contracture by means of progressive accumulative loosening through forced cervical rotation stretching exercises done routinely three times to each side three periods daily, the headaches cleared up, not to return. Likewise, placing an additional pull on the ligaments running from the dorsolumbar portion of the back to the anterior pelvis, thence to the leg, exacerbated the symptoms of backache and menstrual cramps (pain radiating into the peripheral distribution of the ilioinguinal and iliohypogastric nerves arising from the twelfth dorsal and first lumbar nerves passing through the contracted fascial ramifications). After mobilization of the contracture by means of the progressive accumulative loosening through forced posterior tilt of back and pelvis on the leg done routinely three times to each side three periods daily, the backache and menstrual cramps cleared up, not to return. These stretching exercises are now a part of the employee health service program of American Telephone and Telegraph Company and are illustrated by diagrams in a booklet distributed to all its employees."

The background for a portion of the above references is probably as follows. In an article entitled "Menstrual Exercises" (*Indust. Med.* 12:588 [Sept.] 1943) Dr. Billig postulated that dysmenorrhea was frequently the result of "a postural defect of contracted fascial ligamentous bands restricting posterior tilt excursion range of the pelvis in relation to the legs and back. At menstruation (with the change in ovarian hormone level) the ligaments further shorten causing impingement with irritation of the peripheral spinal nerves passing through and by them. The nerves usually irritated are one or more of the following: the 11th dorsal, the 12th dorsal, the first lumbar and their branches, the ilioinguinal and iliohypogastric. The impingement gives rise to symptoms of pain in the low back in the region of irritation or in the region of distribution of these nerves in the lower abdominal wall or groin or both."

This article was co-authored by Dr. A. C. Dick, then medical director of the Consolidated Vultee Aircraft Corporation, and Mrs. H. N. Macy, chief nurse of the same corporation. It was reported that they had achieved a most remarkable decrease absenteeism, reduction in the use of menstrual cramps as an absentee excuse and increased efficiency as a result of the use of the Billig exercises for dysmenorrhea.

Parenthetically in "Queries and Minor Notes" in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION (March 17, 1945, page 684), in commenting upon this theory it was stated: "It has not been proved that in all or most women with primary dysmenorrhea 'there is a postural defect of contracted fascial ligamentous bands restricting posterior tilt excursion range. . . .' Likewise there is no proof that at menstruation the ligaments further shorten, impinge and irritate the peripheral spinal nerves enumerated in the query. . . . In view of the favorable results described, if there was not a large psychic factor involved, some other reason for the benefits must be sought than that given by the proponents."

It should also be noted that the Billig exercises were being taught to the girls in the public schools of Los Angeles in 1944. These factors contributed to an interest by some of the women employees of the Pacific Telephone and Telegraph Company in Los Angeles. On Oct. 11, 1944, the first groups of women in the accounting department were trained in the exercise by a psychotherapist from the Harlan Shoemaker Foundation in Los Angeles, an organization which was sponsoring this activity. The accounting department first introduced the program, then the plant department used the plan, the latter part of October, 1944, and the traffic and commercial department commenced the program in November. Attendance was on a voluntary basis, and all women were given the opportunity to attend if they so desired. The group instructions took approximately three-quarters of an hour, and a case history on each of the girls was taken before proceeding. Subsequent reports made to Dr. Jerome Shilling, medical director of the telephone company in Los Angeles, by the managers of the respective departments in the spring of 1945, indicated that the program had been participated in by 424 plant women employees, 386 commercial women employees, 325 in the accounting department and one class of 62 traffic women employees. It should be noted that in the plant, commercial, and accounting departments the classes were given on company time and in the traffic department on employees' time. The initial enthusiasm apparently soon decreased, and the program has not been continued, largely owing to the disinclination of the women to persevere with the procedure. As expressed by Dr. Shilling, "Regular exercise three times a day becomes monotonous and the individuals are prone to drop by the wayside from this standpoint." In a letter dated Feb. 4, 1946, Dr. Shilling stated: "In conclusion and in specific answer to questions included in your letter, our results have not been conclusive or favorable. I do believe that in very occasional, selected specific cases that definite benefits do result. All in all, however, it has not been our experience that absenteeism was materially affected during the period of time that a number of employees were given instructions at the Billig Clinic. It might be said that we have not given this matter a fair and sustained trial However, as stated above, it is all but impossible to get an individual male or female, to continue with exercises in the prescribed manner and frequency over any sustained period of time Other than for dysmenorrhea, we have had little or no experience with the exercises given for other conditions I have, however had the opportunity to observe cases treated from other organizations and I am yet to be convinced this procedure is the answer to these perplexing chronic problems "

In June 1945, at a Bell System Medical Directors Conference the then existing reports on the Billig exercises and the contents of a brochure by Dr Billig Thirty Days Hath September " which deals with menstruation were discussed In the notes of that conference we stated It has been our opinion that from an objective scientific viewpoint the available evidence on an anatomical and physiological basis leaves considerable to be desired in the way of explanation compared with the reported results The question appears not to be whether or not the Billig exercises will stand in a cold light of scientific appraisal but rather whether or not there may be justification for including it as part of the information on this subject to be made available to our employees The consensus was that the exercise was not harmful and it was included with three other exercises as suggestions for possible relief in dysmenorrhea This booklet is not distributed to all employees as was stated in Dr Billig's July 28 1951 article but rather has been used in conjunction with health education group discussions and in the various company medical departments in specific individual situations

It is contended that the statement "The management of a telephone company noticed a huge prevalence of backache dysmenorrhea, and occipitocervical headaches radiating to the temporal region among the thousands of girls seated with forward thrust of head and neck at switchboards is without basis in fact It is also our opinion, based on the reports of many competent observations that the incidence of the conditions referred to is no greater if as great among telephone operators as compared with any of the clerical groups A great deal of research has been done in the development of switchboards and operators chairs with the objective of comfort and good posture The suggestion that backache, dysmenorrhea, and occipitocervical headaches are occupational in origin is also without basis in fact as related to the requirements of switchboard operating

ALKALOSIS AND HYPERVENTILATION

To the Editor—In their article entitled, Alkalosis Due to Hyperventilation" (*J A M A* 146 1125 [July 21] 1951) Sattler Marquardt and Cummins stress the importance of pH determinations for determining the presence of respiratory alkalosis They state that a review of the literature reveals no clinical reports of hyperventilation alkalosis

In their report they cite three cases where they feel the test was of diagnostic value The first two appear to be well-confirmed cases of hyperventilation on a psychoneurotic basis however, I question the conclusion that the pH determination aided in the diagnosis In both cases the pH was within normal limits before a test period of voluntary hyperventilation In the first case the pH rose to 7 55 after 12 minutes of voluntary hyperventilation in the second it reached 7 49 after five minutes of hyperventilation These values are well within normal physiological limits In the third case that of a patient with cardiac disease who at the time was definitely irrational the pH was 7 62 Restoration of the pH to normal by the use of ammonium chloride was accompanied by disappearance of the mental confusion

It is well known that cardiac disease is one of the causes of lowered alveolar carbon dioxide tension In this case apparently it was sufficient to produce decompensation of the acid-base balance with production of true alkalosis The first two however may well have been cases of carbon dioxide deficit, but, since the pH was within normal limits (before the hyperventilation test period) they were definitely compensated A test of the blood for bicarbonate level would have determined whether a carbon dioxide deficit was actually present

As to the value of ventilation test periods in determining the presence of hyperventilation attention is called to an article by Carryer (*Proc Staff Meet* Mayo Clin 22 456 [Oct 1] 1947) in which the reciprocal relationship of carbon dioxide and pH of the serum during hyperventilation is portrayed in a chart A quick swing to a very high level of pH accompanies voluntary hyperventilation even under completely physiological conditions A further rather extensive discussion of the subject, with some results of experimental observation appears in an article by me (*Postgrad Med* 7 85 [Feb] 1950)

I agree that determination of the pH of the serum is valuable in these cases however, in order to determine precisely the patient s condition at any one time, a bicarbonate level of the blood should be part of the procedure

ACTH, CORTISONE, AND TUBERCULOSIS

To the Editor—The Committee on Therapy of the American Trudeau Society asks the cooperation of the medical profession in a survey of the possible deleterious effects of cortisone and corticotropin (ACTH) on tuberculous infection in man Experimental work has indicated this possibility, and scattered clinical experience has suggested that both compounds may have a harmful effect in human tuberculosis

The American Trudeau Society through its Committee on Therapy, is anxious to obtain information confirming or disproving this impression and asks the cooperation of physicians throughout the country in collecting pertinent data as outlined below Since tuberculosis is a common chronic disease, it seems likely that many physicians have had an opportunity to observe the effects of corticotropin or cortisone on tuberculous infection coincident with the treatment of other disease states The Committee believes that this information is of sufficient importance to make such a study worth while suitable material would provide information of considerable significance which otherwise might not be available for years

It is understood of course that the Committee in no way wishes to interfere with the publication of results by individuals contributing to this study, and will respect any restrictions in the use of material

Information is desired concerning both pulmonary and extrapulmonary tuberculosis as to whether any clinician has observed any of the following effects (1) no apparent effect in patients with known active tuberculosis (2) an exacerbation of clinically active or apparently inactive tuberculosis during or after treatment with cortisone, or (3) a favorable effect in active tuberculosis

If such cases are available, the following data would be greatly appreciated (*a*) a brief clinical history, including a statement concerning the disease for which treatment was given and whether or not active or inactive tuberculosis was suspected before treatment was begun (*b*) pertinent laboratory data, including results of sputum examination for tubercle bacilli and (*c*) the temporary loan of representative x rays related to the tuberculosis if available, before during, and after treatment This information should be sent to Dr Robert H Ebert University of Chicago Clinics 950 E 59th St Chicago 37

LUDVIG HEKTOEN

To the Editor—In the long, honored, indeed magnificent career of Dr Ludvig Hektoen to which you give praise in The Journal of July 14 1951, we wish to note a service overlooked in your obituary to him Dr Hektoen in his wisdom and tolerance and foresight, became a member of the first Board of Trustees of the Institute for Psychoanalysis in 1932 and remained actively interested in the work of the Institute throughout his life For us to overlook mention of this service would be wholly out of keeping with the gratitude and affection we bore to this great scientist

Selenium Disulfide in Seborrheic Dermatitis —Sulfur compounds and preparations have been recommended for the therapy of a great variety of dermatoses, particularly for parasitic infestations and seborrheic dermatitis In the search for more efficient substances in the topical treatment of the seborrheic dermatoses, selenium was considered for therapeutic trial, because of its general properties and the group relationship of sulfur and selenium However, because selenium compounds had been known to have toxic effects, there was some hesitation about using them clinically Some selenium compounds penetrate the intact skin, and many of the more stable inorganic compounds might be studied for possible therapeutic use A moderately stable preparation of selenium disulfide was selected for this study, in the form of a shampoo, which contained 2 5% of selenium disulfide and 17% of sodium alkyl aryl sulfonate (nacconol®) a surface active agent, besides inert and stabilizing agents and water It was found by 48 hour and repeated patch tests for four weeks that the active constituent of the shampoo, selenium disulfide, produced neither primary irritation nor sensitization reactions in 10 normal subjects The shampoo was employed therapeutically over periods from one to seven months in 104 cases, 90 of which were cases of seborrheic dermatitis, without inducing signs of irritation, sensitization, or toxicity There was complete control of 81% of the cases of seborrheic dermatitis of all degrees of severity The shampoo did not influence the clinical course of seven cases of tinea capitis associated with the presence of Microsporum audouini In two patients with atopic dermatitis and three patients with exfoliative dermatitis the amount of scaling of the scalp was reduced In 19 patients who used the selenium shampoo once on their diseased scalp no absorption of selenium was evidenced by an increase in the excretion of selenium in the urine After the use of the shampoo on the badly fissured scalps of two patients for 14 and 19 successive days, respectively, there was no definite evidence of initial or progressive absorption of selenium

Dermatitis Due to Cinnamon —In the case reported in this paper, a chronic vesicular dermatitis of the hands of five years duration was found to be due to tooth paste flavored with cinnamon oil The hand eruption had occurred first and had apparently been induced by repeated contact with cinnamon powder Patch tests with cinnamon oil, 1% in alcohol, gave a 4+ reaction Cure of the entire eruption followed cessation of contact with cinnamon The lips and buccal mucous membrane had not been sensitized Apparently, when the skin is the original surface sensitized, the mucous membranes are seldom sensitized on a clinical level Contrariwise, when the mucous membrane is the original surface sensitized, the skin almost always shares in the sensitization Ingestion of cinnamon powder was followed by itching of the hands in 12 hours Ingestion of cinnamon oil was followed by itching and vesiculation of the hands after five days (delayed reaction) on one occasion and after 12 hours on a second occasion

Hypoglycemic Convulsions in Postpartum Necrosis of Adenohypophysis —According to Clark and associates it was not until Sheehan s series of papers appeared that the true nature of hypopituitary cachexia (Simmonds' disease) was understood and that the relation of the clinical syndrome to ischemic necrosis of the adenohypophysis following severe postpartum collapse and hemorrhage was clarified That hypoglycemia and associated convulsive seizures can occur in this disease was first suggested by Wilder in 1930 Since convulsions may be the presenting symptom, this disorder is of much interest to the neurologist. In the woman whose case is reported the appearance of hypoglycemic convulsions was the dramatic episode that called attention to the diagnosis, although the patient had had premonitory symptoms for 17 years The immediate therapeutic problem was the control of the Addisonian crisis and associated hypoglycemia This end was achieved with aqueous and oil soluble adrenal cortex extract, cortisone, and parenteral injection of sodium chloride and glucose solutions Recovery has been maintained with daily injections of oil soluble adrenal cortex extract and thyroid extract by mouth, along with frequent feedings of a high protein and moderate carbohydrate and fat diet In spite of a grave situation characterized by a number of convulsions and a period of stupor lasting several weeks, the patient s intellectual functions apparently have not been impaired It should be recognized that women who have such symptoms as amenorrhea, myxedema, adrenocortical deficiency, hypoglycemia, and

Rheumatic Fever in Adult Male—Because of the relatively few observations on the course of active rheumatic fever in young adult white males the authors report on 109 such cases encountered during 1948 and 1949 at an Army air base in Wyoming There was evidence of recent beta hemolytic streptococcic infection in almost every case Migratory polyarthritis and fever were the outstanding clinical manifestations of rheumatic fever in this group It was found that carditis could be demonstrated electrocardiographically in a high percentage of cases, provided daily tracings were taken Sinus bradycardia was found during the acute phase of the rheumatic attack with surprising frequency Though the total disease characteristically ran a benign course, organic heart murmurs appeared and persisted in 17 4% of the cases Mitral insufficiency and aortic insufficiency were the two predominant valvular lesions developing Moderate doses of acetylsalicylic acid (aspirin) were probably effective in alleviating symptoms but were ineffective in shortening the course of the illness or in preventing the development of valvular heart disease

Antigen Antibody Mechanism in Rheumatic Diseases.—Brown and co-workers regard the effectiveness of corticotrophin (ACTH) and cortisone in rheumatic diseases as evidence of the allergic nature of these diseases Since adrenal cortical hormones are known to block antigen antibody reactions without destroying the antigen this is presumed to be the mechanism of its action in rheumatic diseases and the explanation for the relapses that occur when it is discontinued The authors suggest that the antigen in the rheumatic diseases is provided by the pleuropneumonia group of organisms, which are intermediate in their properties between bacteria and viruses However, because the size of these organisms makes them invisible in tissues and their fastidious growth requirements make it difficult to culture and subculture them their etiological relationship has not yet been proved Indirect evidence that they may play a role is provided by the parallel between their in vitro response to antibiotics and the in vivo response of rheumatic diseases to the same antibiotics Often antibiotics to which the organisms are sensitive produce exacerbations in symptoms, presumably due to the liberation of increased amounts of antigen from the destroyed organisms In other less sensitive patients antibiotic therapy produces temporary improvement The authors also found that they were able to reduce the antibody-containing serum globulins in patients with rheumatoid arthritis by administering 2 5 to 10 gm of human serum albumin intravenously This effect was comparable to that obtained from cortisone therapy It was accompanied by a decrease in joint pain and swelling that lasted six to eight hours A combination of chloramphenicol and albumin produced even more remarkable improvement Human serum albumin also appeared to influence favorably two cases of serum sickness one severe penicillin reaction, and one case of acute conjunctivitis in Reiter s disease

Contact Dermatitis Caused by Bamboo B L Schiff —p 66

Selenium Disulfide in Seborrheic Dermatitis —Sulfur compounds and preparations have been recommended for the therapy of a great variety of dermatoses particularly for parasitic infestations and seborrheic dermatitis In the search for more efficient substances in the topical treatment of the seborrheic dermatoses selenium was considered for therapeutic trial, because of its general properties and the group relationship of sulfur and selenium However, because selenium compounds had been known to have toxic effects, there was some hesitation about using them clinically Some selenium compounds penetrate the intact skin, and many of the more stable inorganic compounds might be studied for possible therapeutic use A moderately stable preparation of selenium disulfide was selected for this study, in the form of a shampoo, which contained 2 5% of selenium disulfide and 17% of sodium alkyl aryl sulfonate (nacconol®) a surface-active agent, besides inert and stabilizing agents and water It was found by 48 hour and repeated patch tests for four weeks that the active constituent of the shampoo, selenium disulfide, produced neither primary irritation nor sensitization reactions in 10 normal subjects The shampoo was employed therapeutically over periods from one to seven months in 104 cases, 90 of which were cases of seborrheic dermatitis, without inducing signs of irritation, sensitization, or toxicity There was complete control of 81% of the cases of seborrheic dermatitis of all degrees of severity The shampoo did not influence the clinical course of seven cases of tinea capitis associated with the presence of Microsporum audouini In two patients with atopic dermatitis and three patients with exfoliative dermatitis the amount of scaling of the scalp was reduced In 19 patients who used the selenium shampoo once on their diseased scalp no absorption of selenium was evidenced by an increase in the excretion of selenium in the urine After the use of the shampoo on the badly fissured scalps of two patients for 14 and 19 successive days, respectively, there was no definite evidence of initial or progressive absorption of selenium

Dermatitis Due to Cinnamon.—In the case reported in this paper, a chronic vesicular dermatitis of the hands of five years duration was found to be due to tooth paste flavored with cinnamon oil The hand eruption had occurred first and had apparently been induced by repeated contact with cinnamon powder Patch tests with cinnamon oil, 1% in alcohol, gave a 4+ reaction Cure of the entire eruption followed cessation of contact with cinnamon The lips and buccal mucous membrane had not been sensitized Apparently, when the skin is the original surface sensitized, the mucous membranes are seldom sensitized on a clinical level Contrariwise, when the mucous membrane is the original surface sensitized, the skin almost always shares in the sensitization Ingestion of cinnamon powder was followed by itching of the hands in 12 hours Ingestion of cinnamon oil was followed by itching and vesiculation of the hands after five days (delayed reaction) on one occasion and after 12 hours on a second occasion

Hypoglycemic Convulsions in Postpartum Necrosis of Adenohypophysis —According to Clark and associates it was not until Sheehan s series of papers appeared that the true nature of hypopituitary cachexia (Simmonds' disease) was understood and that the relation of the clinical syndrome to ischemic necrosis of the adenohypophysis following severe postpartum collapse and hemorrhage was clarified That hypoglycemia and associated convulsive seizures can occur in this disease was first suggested by Wilder in 1930 Since convulsions may be the presenting symptom, this disorder is of much interest to the neurologist In the woman whose case is reported the appearance of hypoglycemic convulsions was the dramatic episode that called attention to the diagnosis, although the patient had had premonitory symptoms for 17 years The immediate therapeutic problem was the control of the Addisonian crisis and associated hypoglycemia This end was achieved with aqueous and oil soluble adrenal cortex extract cortisone, and parenteral injection of sodium chloride and glucose solutions Recovery has been maintained with daily injections of oil soluble adrenal cortex extract and thyroid extract by mouth, along with frequent feedings of a high protein and moderate carbohydrate and fat diet In spite of a grave situation characterized by a number of convulsions and a period of stupor lasting several weeks, the patient s intellectual functions apparently have not been impaired It should be recognized that women who have such symptoms as amenorrhea, myxedema, adrenocortical deficiency, hypoglycemia, and

Rheumatic Fever in Adult Male.—Because of the relatively few observations on the course of active rheumatic fever in young adult white males, the authors report on 109 such cases encountered during 1948 and 1949 at an Army air base in Wyoming There was evidence of recent beta hemolytic streptococcic infection in almost every case Migratory polyarthritis and fever were the outstanding clinical manifestations of rheumatic fever in this group It was found that carditis could be demonstrated electrocardiographically in a high percentage of cases, provided daily tracings were taken Sinus bradycardia was found during the acute phase of the rheumatic attack with surprising frequency Though the total disease characteristically ran a benign course, organic heart murmurs appeared and persisted in 17 4% of the cases Mitral insufficiency and aortic insufficiency were the two predominant valvular lesions developing Moderate doses of acetylsalicylic acid (aspirin) were probably effective in alleviating symptoms but were ineffective in shortening the course of the illness or in preventing the development of valvular heart disease

Antigen Antibody Mechanism in Rheumatic Diseases.—Brown and co workers regard the effectiveness of corticotrophin (ACTH) and cortisone in rheumatic diseases as evidence of the allergic nature of these diseases Since adrenal cortical hormones are known to block antigen-antibody reactions without destroying the antigen, this is presumed to be the mechanism of its action in rheumatic diseases and the explanation for the relapses that occur when it is discontinued The authors suggest that the antigen in the rheumatic diseases is provided by the pleuropneumonia group of organisms, which are intermediate in their properties between bacteria and viruses However, because the size of these organisms makes them invisible in tissues and their fastidious growth requirements make it difficult to culture and subculture them, their etiological relationship has not yet been proved Indirect evidence that they may play a role is provided by the parallel between their in vitro response to antibiotics and the in vivo response of rheumatic diseases to the same antibiotics Often antibiotics to which the organisms are sensitive produce exacerbations in symptoms, presumably due to the liberation of increased amounts of antigen from the destroyed organisms In other less sensitive patients antibiotic therapy produces temporary improvement The authors also found that they were able to reduce the antibody-containing serum globulins in patients with rheumatoid arthritis by administering 2 5 to 10 gm of human serum albumin intravenously This effect was comparable to that obtained from cortisone therapy It was accompanied by a decrease in joint pain and swelling that lasted six to eight hours A combination of chloramphenicol and albumin produced even more remarkable improvement Human serum albumin also appeared to influence favorably two cases of serum sickness, one severe penicillin reaction, and one case of acute conjunctivitis in Reiter's disease

Osteonephropathy in Children.—The term osteonephropathy includes a variety of closely related but distinct syndromes in which there are bone changes associated with renal disease These are renal rickets, nephrocalcinosis, the Fanconi syndrome, and idiopathic hypercalcuria Two of these entities, renal rickets and nephrocalcinosis, are discussed in detail with presentation of eight cases of the former and one of the latter The bone changes in renal rickets resemble a combination of rickets and hyperparathyroidism, with one or the other predominating The roentgen appearance of long bones is sufficiently characteristic to enable one to make the diagnosis of renal rickets in a great majority of the cases Cortical erosions are an important diagnostic clue, but it is difficult to differentiate primary hyperparathyroidism from renal rickets on the basis of the bone changes alone Fortunately, primary hyperparathyroidism in children is an extremely rare disease The roentgen appearance of the long bones in nephrocalcinosis differs in no way from ordinary rickets Renal calcifications, if present, may be suggestive, but the final clinical diagnosis cannot be made without a complete history, physical examination, and laboratory study If sufficient renal impairment is present in primary hyperparathyroidism, the bone lesions could be indistinguishable from renal rickets The diagnosis could then only be made after exhaustive clinical and laboratory studies In primary hyperparathyroidism, there is almost always elevation of the serum calcium level as opposed to the normal or slightly depressed serum calcium level found in renal rickets

Phonocardiography and Cardiac Surgery —The graphic recording of the heart sounds (phonocardiography) is a much more objective and reliable method of studying functional changes in the heart than is auscultation Moreover, simultaneous phono cardiograms and part-electrocardiograms yield a more accurate estimate of ventricular systole than any other method For these reasons phonocardiography was used to study the functional changes in the cardiovascular system in three patients following operations for coarctation of the aorta, rheumatic mitral stenosis, and tetralogy of Fallot, respectively The systolic murmur in the first case and the diastolic murmur in the second disappeared while the systolic apical murmur in the third case was highly attenuated In the patient with coarctation of the aorta, the hemodynamic systole, which was normal before operation, was temporarily shortened after operation but soon returned to normal In the patient with mitral stenosis the preoperatively shortened systole was distinctly prolonged postoperatively, although not the normal value In the patient with tetralogy of Fallot systole was constantly normal The authors recommend this combination of phonocardiography and electrocardiography in the evaluation of the effects of cardiac operations

Sex Linked Juvenile Diabetes Mellitus.—This report presents a genetic and clinical study of a family of eight persons (three boys, three girls, and their parents) The father and the three girls are of average height and have brown hair and eyes, the mother and the three boys have blond hair and blue eyes The growth curves of the boys and their mother fall within the lowest 1% of the normal range The boys have diabetes mellitus The other members of the family show no dextrose intolerance The family history was traced back for three generations, and it is believed that the diabetes mellitus is probably inherited as a sex-linked recessive characteristic with heterozygous parents Considered mathematically, growth retardation and blondness in the same siblings are thought to be inherited as recessive autosomal characteristics from a homozygous mother and a heterozygous father

Effect of Decreasing Amount of Lung Tissue on Right Ventricular Pressures in Animals R. F Carlson B C Charbon H. G A Charbon and W E. Adams —p 621

Bullet Embolus to Femoral Artery Following Thoracic Gunshot Wound.—The man whose case is presented was shot in the right arm and right flank Half an hour later he noticed pain in his left groin and soon thereafter pain throughout his entire left leg with inability to walk One bullet entered just anterior to the right greater trochanter, the other went through the soft tissues posterior to the right humerus and entered the chest through the fifth interspace The left leg was cold and paralyzed below the knee Roentgenograms showed no foreign body in the chest where one was expected but the shadows of two bullets were present in the film of the pelvic region The bullet that had entered the right hip lay along the inferior ramus of the right pubic bone The other bullet lay in the position occupied by the left femoral artery immediately over the head of the left femur at the point where the profunda artery arises It was thought at first that the bullet that entered the region of the right hip had damaged the lumbosacral plexus causing paralysis A neurosurgical consultant felt that a vascular occlusion was the cause The bullet was found in the artery just at the point where the profunda branch arises It was extracted This appears to be the sixth case of its kind with survival of the patient In addition 15 other cases in which bullet wounds of the heart or associated great vessels had been followed by peripheral arterial embolization of the foreign body are summarized Study of these cases suggests that a thoracic wound with a small caliber missile may do no serious damage to the lungs and pulmonary vessels but still may have sufficient force to pierce one wall of the aorta or of a cardiac chamber It may then be embolized immediately or later to the systemic vessels being carried usually to the iliac or femoral vessels and more commonly to the left side In bullet wounds with only a wound of entrance, failure to demonstrate the foreign body in the expected region should cause suspicion that it may have entered the cardiovascular system and been carried away Other parts of the body should be studied roentgenographically The correct diagnosis should be followed by early embolectomy

Carcinoma of Colon and Rectum —Reported results of treatment in cancer of the colon and rectum are characterized by extreme disparity The surgeon who discards cases not operated on, those in which only palliative resection was done, deaths from operations, later deaths from extraneous causes and patients who have not been followed obviously will have a comparatively high percentage of cancer cures but such a system is manifestly unfair to anyone who wishes to consider the entire problem of cancer of the colon and rectum The two best methods of calculating survival rates are (1) inclusion of all cases appearing in a given clinic or geographical area and (2) calculation of survival rates on the number of patients on whom resections for cure are performed This paper analyzes 1 876 cases of carcinoma of colon and rectum that were observed at the Massachusetts General Hospital from 1937 to 1948 Of this number, 1,088 were seen between 1937 and 1943, and the five-year survival rate was determined for this group Over all figures indicate that 77% of the patients who entered the hospital with cancer of the colon and rectum from 1937 to 1948 had resection of the involved bowel The resectability increased from 72% in 1937-1943 to 81% in 1944 1948 Five year survivals were obtained in only 25% of those observed from 1937 to 1943 If the results are calculated on the basis of operative survivals with resections for cure 45% survived the five year period The latter figure varies depending on whether lymph nodes are involved (55% when they are not involved, 26% when metastases are present) Prophylactic colectomy should be performed in ulcerative colitis and multiple polyposis Polyps of the rectum or low sigmoid may be treated by fulguration through the sigmoidoscope when the pedicle is long and benign If after a polyp has been removed through the sigmoidoscope the pathologist returns a diagnosis of cancer, a radical operation should usually be performed Resection of a segment of the colon and mesentery should be done when the polyp is in the sigmoid or higher Complete left colectomy is required if metastatic nodes are found during a resection for cancer of the sigmoid or left colon Resection of tumors of the lower sigmoid and intraperitoneal rectum with anastomosis should not be done unless at least 5 cm of normal bowel and pericolic tissue can be obtained below the tumor Unfortunately nearly two thirds of all patients with cancer of the colon and rectum are incurable when they reach the hospital Further improvement in therapeutic results will depend on routine proctosigmoidoscopy as an integral portion of the physical examination

Coxsackie Virus Infection —Coxsackie virus was first identified during a study of five small outbreaks of poliomyelitis in New York during the summer of 1947 The first strains were isolated from two paralyzed boys in the village of Coxsackie The other epidemics in New York that year did not yield Coxsackie virus but a number of isolations including a second serologic type, were made later from specimens collected during the summer of 1947 in Wilmington, Del During 1948 and 1949 the search was widened in New York, and 24 isolations were made including additional types and a second variety, Coxsackie virus group B This report summarizes the clinical and epidemiological observations made during these three years The data are derived largely from the records of 517 patients whose feces were tested for pathogenicity for suckling mice Of the 517 cases tested, 30 (5 8%) yielded Coxsackie virus The virus was commonest in younger children and during the late summer months The clinical records of poliomyelitis" patients from whom Coxsackie viruses were isolated did not differ significantly from the records of patients from whom virus was not isolated The percentage of specimens that contained virus was greatest in 1947 and least in 1949 There was an inverse relation between the frequency of isolation of Coxsackie virus and the frequency of paralysis by year If such a difference occurred consistently it would afford one means of distinguishing between poliomyelitis epidemics that are and those that are not complicated by the presence of Coxsackie-virus infection

Histamine in Marchiafava Micheli Syndrome —The history is presented of a man, 42, with slight jaundice, weakness, an enlarged spleen and liver, and paroxysmal hemoglobinuria This and the positive Ham-Horack test classified the case as one of Marchiafava-Micheli syndrome, also known as paroxysmal nocturnal hemoglobinuria The literature on the therapy of this condition indicates that neither blood transfusion nor splenectomy, nor various other treatments produce satisfactory results It appears that the red blood cells in these patients have for some reason become sensitized to a potential lysin present in the patient s own serum and in normal serum Working on this hypothesis one of the authors of this paper attempted to desensitize the patient with histamine diphosphate This was first given intravenously in a dose of 2 75 mg in 250 cc of isotonic solution of sodium chloride After eight consecutive days of therapy the Ham Horack test showed no hemolysis between the patient s cells and serum and only partial hemolysis between the patient s cells and normal serum After another 12-day course of histamine the Ham Horack test again showed the same results Eighteen days later, the test had become completely negative for hemolysis of the patient s red blood cells between both the patient s serum and normal serum When it was found that the anemia persisted (erythrocyte count between 2 and 2 9 million and hemoglobin of 45 to 49%), the bone marrow was examined and erythroblastic hyperactivity was discovered Skin tests, which were made because of a history of urticaria, remained negative Liver biopsy disclosed normal tissues but hemosiderosis It was decided to resume histamine desensitization, but this time via the subcutaneous and later the intramuscular route Later, because there was no improvement in the anemia and because there was again hemolysis between the patient's cells and normal serum, the intravenous administration of histamine was resumed After this the Ham-Horack test showed negative hemolysis between the patient s cells and both normal and his own serum The intravenous administration of histamine has been continued to date, but the anemic picture remains unchanged It is suggested that there may be an altered phospholipid cholesterol ratio in the stroma of the red blood cells

Heterotopic Pregnancy —The woman whose case is presented had had her last menstrual period on Oct 10, 1949 She had two living children but no miscarriages She complained of lower abdominal pain and vaginal bleeding Pelvic examination revealed a soft uterus enlarged to the size of a two and one-half to three month pregnancy and marked tenderness in the left adnexal region Sedatives and bed rest were ordered, and the vaginal bleeding subsided One week later, on Jan 3, 1951 she had severe cramps in the left lower quadrant and vaginal spotting and was in mild shock She was hospitalized with a provisional diagnosis of ruptured left tubal pregnancy Exploratory laparotomy revealed a large quantity of blood in the peritoneal cavity The left tube was distended with a ruptured tubal pregnancy The fundus was soft and symmetrically enlarged to about the size of a two and one half to three month pregnancy The pregnant tube left ovary and the appendix were removed, and the abdomen was closed After the operation the woman was seen at monthly intervals A full term living female infant was delivered in July Ectopic pregnancy is said to occur about once in every 300 normal pregnancies, and the incidence of combined pregnancy is about one in 30,000 pregnancies The preoperative diagnosis of heterotopic pregnancy is a difficult one, because of concomitant enlargement of the uterus Cul de sac tenderness with a soft enlarged uterus should bring to mind the possibility of such a diagnosis A second sign of double pregnancy is the presence of two corpora lutea in the ovaries, indicating the possibility of two conceptions

Detection of Lung Cancer —Early detection and cure rates should be higher for lung cancer than for cancer of any other internal organ for two reasons 1 The lungs can be screened more readily on a mass production basis than any other organ, because the subject does not have to be seen by the physician 2 Small cancers a few millimeters in diameter produce detectable shadows in survey roentgenograms In various surveys the incidence of primary neoplasms of the lung among patients with asymptomatic lesions discovered by roentgenography has varied from 35 to 74% Exploratory thoracotomy is necessary to establish the diagnosis in many cases, negative bronchoscopic or cytological examinations should not be used as evidence of the absence of cancer In Overholt s experience with 863 cases of primary cancer of the lung, 75% of the asymptomatic patients had localized lesions with no evidence of spread, whereas this was true of only 11% of the symptomatic cases The lesions were resectable in 100% of the asymptomatic group and in 30% of the symptomatic group The five year cure rate for the symptomatic group was 11% If current trends continue, the cure rate for the asymptomatic patients will be 75%

Incidence of Lung Cancer —These authors believe that the alleged increase in the incidence of cancer of the lung is more apparent than real In a review of 6,663 autopsies performed between 1920 and 1949 they found 1 017 cases of cancer, of which 67 were cancers of the lung From their material and from the literature they concluded that the frequency of cancer of the lung relative to all malignant tumors is similar to that observed 25 to 50 years ago They believe that lung cancer, which is commonest in the sixth decade of life, appears to be increasing only because a larger proportion of the population now reach this age They also believe that data on the incidence of lung cancer obtained from death certificates are not reliable, since many supposed tumors of the lung are metastatic rather than primary Finally, they observe that since 92 5% of lung cancers occur in males and 83 5% in the white race, as contrasted with the Negro race, both sex and race may play some role in the pathogenesis of this tumor

Spinal Anesthesia for Post Partum Atony of Uterus.—In 1942 Hansen reported four cases of post partum atony of the uterus in which spinal anesthesia proved effective Since that time this treatment has been used in eight other women (in one of them in two births) Each time the desired effect was obtained The hemorrhage varied from 800 to 1,900 ml One patient was in deep shock before the spinal anesthesia was given, yet the effect was prompt and life saving It is important that the blood lost be replaced by blood transfusion The method should be used before the blood loss exceeds 750 ml , if the blood pressure shows signs of falling, when it is certain that the placenta is intact, and when pituitary extract and ergot preparation and compression of the aorta have had no effect Should the method fail hysterectomy can be performed as a last resort without further anesthesia A 3 5% solution of procaine hydrochloride was used in all cases, from 10 to 12 ml were injected in the course of four or five minutes The blood pressure fell in most cases, but this could be counteracted by means of ephedrine The blood transfusions contributed to the recovery

Hydatid Cysts of Lung.—When an unruptured hydatid cyst of the lung is completely removed surgically the patient usually has a smooth convalescence and serious sequelae are uncommon When patients are first seen with the cyst already ruptured, complications will be more frequent and the mortality rate will approximate 5% The main sequelae are (1) anaphylactic shock (2) lung hydatid abscess persistent cavity and chronic empyema, (3) recurrence of daughter cysts and (4) fibrosis and bronchiectasis This report is based on observations on 80 cases of hydatid cysts of the lung, of which 70 have been followed up Fifty of these patients, who have been under observation for one to 28 years, show no sign of persisting pulmonary lesion attributable to hydatid cysts of the lung The postoperative course was unsatisfactory in the remaining 20 cases There were four deaths following operation After briefly reporting the histories of these four patients the author discusses the prevention and treatment of the four groups of sequelae

Kaposi's Varicelliform Eruption —This paper describes a group of cases of Kaposi s varicelliform eruption that appeared at the time of widespread vaccination occasioned by the presence of smallpox in Glasgow Of the 10 patients observed four were unrelated two were members of the same household, and four were infected while in hospital for treatment of a preexisting skin condition All had suffered previous skin damage and all had had contact with recently vaccinated persons but were unvaccinated themselves, except for one, who had been vaccinated about a week before his illness All showed the clinical picture of a grouped pustular eruption situated on an erysipeloid base Vaccinia virus was recovered in four cases Two of the 10 patients were only mildly ill and required only local treatment Four others were moderately febrile for two or three days appearing to respond favorably to penicillin and a combination of sulfonamides The remaining four patients had general toxemia which ended fatally in one case and endangered life in the other three Penicillin with or without sulfonamides, had no effect, whereas the administration of aureomycin in two of them appeared to coincide with a significant fall of temperature and striking improvement Kaposi s title notwithstanding there is little likelihood of confusion with chickenpox The resemblance to small pox on the other hand, particularly in an adult whose face is affected, may be very striking Since Kaposi s eruption is highly infectious in susceptible persons unvaccinated sufferers from eczema should be warned of the danger of exposing themselves to contact with vaccinia A newly vaccinated person should not be admitted to a hospital ward particularly a dermatologic ward, without proper precautions to safeguard the other patients During times of widespread vaccination it would probably be wise to discharge from dermatologic wards patients, particularly children with allergic eczematous conditions

Changes in Sweating After Prickly Heat —A man newly arrived in the tropics was given (in October) an acclimatization test consisting of five 20 minute cycles of work and rest in a climate of 100 F (37 8 C) dry bulb 93 5 F (34 2 C) wet bulb air movement 50 ft (17 m) a minute Pulse rates rectal temperatures and body weights were recorded every 10 minutes serial samples of sweat were obtained by an arm bag and analyzed for chloride and water drunk and urine passed were measured Within a few weeks, and a short while after a severe sunburn prickly heat developed The irritation kept him awake at night and he began to complain of lassitude and debility The condition was exacerbated by exposure to climates in which although he sweated freely evaporation was rapid enough to leave the skin sticky rather than wet, profuse sweating, with perspiration running off the skin, tended to give relief In March, after he had been going into the climatic chamber three or more times a week for 20 weeks, he was again tested to determine to what extent he had become acclimatized Changes the reverse of acclimatization were found He had a mild form of type 2 heat exhaustion, which, in accordance with Selye s terminology, might be called a ' disease of adaptation " The adrenal cortex seems to be involved in the control of sweating Prickly heat would be the stress which, added to the several already imposed by a tropical climate, would rapidly lead to what Selye calls the exhaustion stage," so that even after apparent recovery the heat tolerance remains diminished

Lowered Resistance to Infection Resulting from Cortisone and Corticotrophin —It became evident in animal experiments that toxic doses of cortisone and corticotrophin (ACTH) usually cause death as a result of unbridled bacterial proliferation This usually starts in the lung and leads to pulmonary abscess formation, but eventually it may evoke the picture of general septicemia with abscesses in the liver, spleen, kidneys, and sometimes other organs The increasing clinical use of these hormones revealed that they also predispose patients to infection In particular, they may reactivate dormant foci of pulmonary tuberculosis Similarly, in certain types of pneumonia, corticotrophin and cortisone may promote the invasion of the causative microorganisms into the general circulation The mechanism through which corticotrophin and cortisone diminish resistance to infection is not yet clearly understood, but theoretic considerations led Selye to suspect that the inhibitory effect of these hormones on granuloma formation (and the consequent encapsulation of infectious foci), their destructive effect on lymphatic tissues, as well as their general catabolic effects, might be involved Since in all these respects the somatotrophic hormone (STH) acts as an antagonist of corticotrophin, he felt that it would be of interest to establish, by animal experiments, whether somatotrophic hormone could raise resistance to infections Experiments performed on rats to ascertain this revealed that both cortisone and corticotrophin, when given in toxic doses, can cause fatal systemic infections that are presumably due to otherwise non pathogenic micro organisms, such as are normally present in the body This effect of cortisone and corticotrophin can be completely prevented by suitable doses of purified somatotrophic hormone

Treatment of Alcohol Withdrawal Symptoms —One of the most successful treatments for the intoxicated alcohol addict consists in the intravenous injection of dextrose, insulin and a solution of vitamin B complex However, the contraindications of severe heart disease, hematemesis, and inaccessible superficial veins must be kept in mind The injection is prepared by adding to a 50 cc vial of 50% dextrose an amount of standard insulin estimated on the basis of age and weight (from 10 to 50 units) and a solution of vitamin B complex containing a minimum of 20 mg of thiamine and 200 mg of nicotinamide This mixture is drawn into a 50 cc syringe and injected slowly into one of the cubital veins An optimum reaction is one in which the patient begins to perspire and goes to sleep approximately one hour after the injection This reaction is allowed to proceed for a minimum of 30 to 45 minutes before it is terminated with 50 cc of 50% dextrose given intravenously, preferably into a different vein than the one used for the original injection Usually, the reaction is terminated with a sweet drink If no reaction occurs after 90 minutes, it is permissible to inject an additional 10 or 20 units of insulin intramuscularly From the time of injection, until the insulin reaction is completed, it is imperative that a nurse be in constant attendance on the patient and that a physician be immediately available When a good initial reaction has been obtained, a patient may benefit from a second reaction of this type at any time after a six hour interval In the chronic phase of alcohol addiction the injection has been repeated three times within the first 36 to 48 hours in order to more rapidly restore normal sleeping and eating habits A satisfactory insulin reaction after the first injection with diminution in craving and improvement in behavior was observed in 272 of 325 patients (84%) This method can be employed in the general hospital Delirium tremens can be avoided or, if present, may be rapidly interrupted There is no necessity for the 'tapering off' technique with this treatment The use of sedatives, hypnotics, or narcotics is contraindicated in the treatment of alcohol addiction

Role of Hypophysis in Formation of Constitutional Types J A Schneider —p 161

Menstruation Induced by Desoxycorticosterone Acetate During Menopause —Desoxycorticosterone or its acetate influences the sex organs It has accelerated sexual maturation in mice and promoted the growth of the uterus in young rabbits In castrated rats who have undergone adrenalectomy, it has been known to exert a folliculinizing and luteinizing effect At the medical clinic of the University of Würzburg it was possible to observe the influence exerted by desoxycorticosterone acetate on the genital system, when it was administered for various disorders, particularly for gastric and duodenal ulcer in women between 20 and 65 With a daily dose of 20 mg , menstruation was often brought on from two to five days before the usual period Furthermore, menstruation recurred in six women between 54 and 64 who had not menstruated for years A table presents data on age, duration of menopause, dosage of desoxycorticosterone acetate, and duration, amount, and painfulness of menstruation produced by desoxycorticosterone acetate The relation of desoxycorticosterone to the endometrium presupposes a complex action mechanism, and the authors suggest possible interrelated functions

Addison's Disease and Pernicious Anemia —In the classic description by Addison of the disease named after him, anemia is given as the cause Later the combination of severe anemia, particularly of pernicious anemia and Addison s disease (suprarenal insufficiency), has been repeatedly denied or ignored However the combination has been mentioned by Biermer, by Bittorf in one of a series of cases of chronic Addison s disease and more recently (1949) by de Gennes and several other French investigators In the case described by these French investigators, temporary suprarenal insufficiency accompanied pernicious anemia The diagnosis was established by the demonstration of diminished 17 ketosteroids in the urine The suprarenal insufficiency subsided following effective treatment of the pernicious anemia, and the authors assume that the suprarenal insufficiency was of the functional type A new case of concurrence of pernicious anemia and suprarenal insufficiency is reported in this paper Despite the rarity of this combination it must be decided whether the connection is causal, as was originally supposed Stephan contended that prolonged existence of suprarenal insufficiency almost invariably results in serious anemia and that the diseases are related Boenheim does not agree with Stephan, he stresses the essential difference in the etiology of these two diseases but nevertheless admits possible connections between them

•Good Tolerance and Favorable Results of Intravenous Iron Therapy N Passarelli —p 775
•Immunization Against Influenza J G Lacorte —p 785
•Intradermal Reaction with Polysaccharide Fraction Isolated from Culture of Leishmania Brasiliensis in Cases of Leishmaniasis Americana J Pellegrino —p 859

Results of Intravenous Iron Therapy.—A new iron preparation, sodium-di(α,μ-dihydroxy-β,β-dimethyl butyrate)-ferrate, containing 10 mg of trivalent iron per cubic centimeter, was administered intravenously to 16 patients aged 14 to 57, with hypochromic microcytic, normochromic, or pernicious (macrocytic) anemia The anemia was due to verminosis, nutritional deficiency, hemorrhages from gastroduodenal ulcer or pregnancy A dose of 2 cc. of the preparation was given either daily, every other day, or twice a day, for a total of six to 93 injections, according to the response of the blood The injections were well tolerated No immediate or late untoward reactions were observed after a total of 269 injections Hemoglobin and erythrocyte levels in blood increased in the patients with hypochromic anemia Pernicious anemia did not respond to intravenous iron therapy Among the other cases there were favorable results in six and negative results in three In one case, resistance to iron therapy developed In two cases of severe anemia an initial partial improvement, with rise of erythrocyte count and hemoglobin level, was followed by lack of response to the drug In another case, the blood picture improved after administration of vermifuges followed by oral iron therapy, which was then well tolerated The author concluded that intravenous injection of iron is indicated in all the cases of iron deficiency that do *not* respond to, or do not tolerate iron by mouth

Immunization Against Influenza.—The Virus Research Center of the Oswaldo Cruz Institute in Rio de Janeiro supplied 560,435 doses of influenza vaccine from 1945 until March 1951 These gave satisfactory immunizing results The vaccine contains viruses A and B (strain PR8 and LEE) and FM 1 of type A' The virus is inactivated with formaldehyde, in 1 10,000-1 5 000 dilution Single doses of 1 cc are administered subcutaneously They cause immunity lasting six months Reactions caused by the vaccine are rare, and there are no contraindications Incidence of influenza was smaller among those who were vaccinated during the epidemic outbreaks of 1945, 1949, and 1951 Among the difficulties in the preparation of vaccines are the multiplicity of types and strains of viruses isolated during different epidemics, a fact that shows the necessity of studying influenza on an international basis to understand its epidemiology and to prepare vaccines having the adequate antigenic structure To this end, strains of viruses from all over the world are sent by laboratories to the World Center for Influenza in London for study

Intradermal Reaction for Leishmaniasis Americana.—Pellegrino used Fuller's technique for isolating the polysaccharide fraction of Leishmania brasiliensis With this fraction he made intradermal inoculations in two cases of mucocutaneous leishmaniasis Intradermal inoculation was also done with an antigen prepared by suspension of a culture of Leishmania brasiliensis in sodium chloride solution containing sodium ethylmercurithiosalicylate (merthiolate®) in the proportion of 1 5 000 The reaction was strongly positive in both patients and with both antigens In six normal persons the reaction was negative

Electroencephalographic Observations in Internal Medicine J Moeller and O R Mantz.—p 400
Streptokinase Mechanism of Action and Possibilities of Clinical Application. T Halse —p 406

Dualistic Endocrine Output of Insular System —According to Ferner, there is a functional antagonism corresponding to the cytological dualism presented by the islands of Langerhans Glucagon, a glycogenolytic principle that increases the blood sugar originates in the alpha cells, while the beta cells produce insulin The quantitative proportion between the alpha and beta cells in a normal adult is 20% alpha cells and 80% beta cells This ratio occurs only when carbohydrate metabolism is normal as shown by the physiological level of the blood sugar, and any change in this ratio is associated with a disturbance of the carbohydrate metabolism Progressive hyperinsulinism develops in patients with insuloma that consists nearly exclusively of hyperactive giant beta cells In diabetes mellitus produced experimentally in animals by alloxan injections, partial pancreatectomy, or administration of massive doses of extracts of anterior pituitary lobe as well as in patients with diabetes mellitus, the ratio between alpha and beta cells is changed in favor of the alpha cells, from which the principle originates that increases the blood sugar The significantly increased number of alpha cells is the proximate cause of the hyperglycemia. The suggestion seems to be justified that a 'diabetogenic" change in the alpha-beta cell ratio may occur in diabetes mellitus under the influence of factors outside the pancreas

Etiology of Dupuytren's Contracture —Herzog saw 20 cases of Dupuytren s contracture at a 150 bed hospital in the course of two years Since many patients asked compensation on the ground that hard work had caused the contracture, the author investigated this problem Many literature reports suggest a hereditary predisposition, and a few observers recognize trauma from hard work as a possible contributory cause Herzog investigated the incidence of Dupuytren's contracture among 1,000 steelworkers 1,000 miners, and 1,000 clerks The respective figures for these groups were 24, 22 and 19 It was noted that most of the cases of Dupuytren s contractures occurred in men over 40, and considering only these, the percentages of incidence were 4 3%, 4 6%, and 3 75% for the three aforementioned groups The incidence varied greatly in different groups for instance, two cases were found in 25 bank clerks who were over 40 and no case among 136 miners, of whom 64 were over 40 For this reason the author feels that the slight difference in the incidence between clerks and workmen is of no significance He concludes that his investigation has produced no evidence that work in mines or steel mills leads to Dupuytren s contracture He does not think that claims for compensation are justified

BOOK REVIEWS

Diabetes Mellitus: Principles and Treatment By Garfield G Duncan, M.D Clinical Professor of Medicine Jefferson Medical College Philadelphia. With collaboration of Ferdinand Fetter M D Assistant Professor of Medicine University of Pennsylvania Philadelphia Perry S MacNeal M D Associate in Medicine Jefferson Medical College Philadelphia Barkley Beidleman M D Assistant in Medicine Jefferson Medical College Philadelphia, and Martha A Hunscher B S Director of Food Clinic Pennsylvania Hospital Philadelphia. Cloth $5 75 Pp 289 with 31 illustrations W B Saunders Company 218 W Washington Sq Philadelphia 5 7 Grape St Shaftesbury Ave London W C 2 1951

Dr Duncan's new contribution to the textbook literature on diabetes mellitus is a valuable guide for any physician The style of the volume is simple, and its contents are arranged in orderly fashion It is direct, concise, practical, accurate, and sound in its approach The wide experience of the author is detailed in so well-organized and clear a manner that his book will be a refreshing aid to all who are not too familiar with this fascinating disease but who wish to take advantage of modern methods of diagnosis and treatment

There are no superfluous details or elaborations, yet no important phases are neglected or omitted No personal preferences are stressed, and no prejudice is entertained Tables and diagrams are included in generous numbers For the most part they are informative and useful Illustrations, particularly of pathological phenomena, are faithfully descriptive

In conformance with the vast majority of experts in the field, the author insists on the wisdom of maintenance of good control as a probable preventive of complications He stresses the undesirability of obesity, the value of weight reduction and even some degree of undernutrition in treatment, and the preservation of sugar tolerance by control of weight and sugar levels The diet system outlined is quantitative, with a choice of weighing or measuring systems The new food exchange system approved by the American Diabetes Association is advised Indications for various types of insulin and the clinical results of their application are outlined clearly Complications, surgical management, and vascular disease are given adequate emphasis There is an excellent review of the important endocrine relationships in the physiology and clinical association of factors affecting regulation of the sugar balance Significant references to the literature conclude each chapter

A large amount of valuable pertinent information has been condensed into a relatively small volume with discrimination It may be recommended to students of the disease as a conservative and complete modern treatise on the subject

Post-Graduate Lectures on Orthopedic Diagnosis and Indications By Arthur Steindler M.D F.A C S Professor of Orthopedic Surgery State University of Iowa Iowa City Iowa Volume II Section A Paralytic Disabilities Section B Static Disabilities. Cloth $6 Pp 198 with 140 illustrations Charles C Thomas Publisher 301 327 E. Lawrence Ave Springfield Ill Blackwell Scientific Publications Ltd 49 Broad St Oxford England Ryerson Press 299 Queen St. W Toronto 2B 1951

Dr Steindler is well known in the field of orthopedic surgery His many writings have made him familiar to all orthopedists His writings are based on his vast experience and are evaluated by a keen scientific mind This book is a series of lectures for postgraduate students in orthopedic surgery This is part of a series of monographs and contains a section on paralytic disabilities and a section on static disabilities

Besides speaking from his own experience, the author also presents all concepts that are considered of value at the present time There is a nicely balanced record of the conservative and operative treatment of the conditions he discusses Under the subject of paralytic disabilities he covers poliomyelitis and its etiology, pathology, diagnosis, and treatment He discusses paralytic scoliosis The fourth lecture concerns spastic paralysis Under static disabilities he discusses low back pain, including idiopathic low back pain as well as back pain due to intervertebral discs He also discusses idiopathic scoliosis

There is a comprehensive lecture on internal derangements of the knee The mechanics of the foot are discussed In treatment the author refers to the usual recognized conservative and operative measures The subject matter is well arranged, and the type and paper are of excellent quality The illustrations are clear, well selected, and well reproduced There is a selected bibliography following each chapter Dr Steindler writes in a simple and clear manner This book expresses his concepts much more clearly than did some of his original scientific articles

Handbuch der inneren Medizin Herausgegeben von G v Bergmann und W Frey Unter Mitwirkung von H Schwiegk Begründet von L. Mohr und R Staehelin. Band II Blut und Blutkrankheiten Neu bearbeitet von Ludwig Heilmeyer Dr med O O Professor Direktor der medizinischen Universitätsklinik Freiburg i Br und Herbert Begemann Dr med., Leiter des hämatologischen Laboratoriums der medizinischen Universitätsklinik Freiburg i Br Band VIII Nieren und ableitende Harnwege Die hämatogenen Nierenerkrankungen Die ein und beidseitig auftretenden Nierenkrankheiten. Erkrankungen der Blase der Prostata der Hoden und Nebenhoden der Samenblasen, funktionelle Sexualstörungen bearbeitet von Walter Frey und Friedrich Suter Fourth edition Cloth Pp 1179 with 474 illustrations 1167 with 193 illustrations. Springer Verlag Reichpietschufer 20 Berlin W 35 (West Berlin) Neuenheimer Landstrasse 24 Heidelberg Göttingen 1951

This is Volume 2 of the well known Manual on Internal Medicine" originally edited by Mohr and Staehelin It could be called a system rather than a manual, for it covers the field of internal medicine in detail, with extensive documentation It is a useful reference work The present editors are recognized internists fully competent to carry on the traditions of the original work In the introductory remarks the editors comment on the desirability of the Morgagnian concept of pathological anatomy as a basis for the study of disease but point out that the blood is not an organ and that its diseases are reflections of abnormalities in the blood forming organs The work opens with a general section discussing the composition of the whole blood, including its total volume, the plasma, the general cytology and bone marrow physiology, and the technique and general results of spleen and lymph node puncture Then follow chapters on the morphology and physiology of the erythrocyte system, the formation and destruction of red blood cells and hemoglobin, and a discussion of blood grouping and transfusion This is followed by discussions of the special diseases of the red blood cells, and the different types of anemia and polycythemia, their symptomatology, diagnosis, prognosis, and treatment The leucocytes and the reticuloendothelial system are then discussed in their morphological and physiological aspects and in respect to hereditary and acquired diseases, with a special discussion of the x ray treatment of Hodgkin s disease There are sections on the hemorrhagic diatheses, the diseases producing abnormalities in clot formation, the aplastic and hypoplastic myelopathies, and blood parasites An appendix on diseases of the spleen and the lymph nodes concludes the volume

The book is attractively bound, and the paper and typography are excellent. The illustrations, many of them colored, are of high quality, and the text is not difficult to read There is abundant evidence that the writers have consulted medical literature widely and have given due credit to contributors. While the arrangement differs somewhat from American works of similar scope, it is logical and satisfactory The book can be recommended as a competent and well-documented survey of the field

Volume 8 of the fourth edition is contributed by competent workers in the field of kidney diseases and diseases of other sections of the genitourinary tract The volume opens with a historical chapter that covers the period of Malpighi and also discusses the work of his successors, notably Ruysch, Haller, Bowman, Johannes Müller, Bichat, Henle, Ludwig, Bright, Virchow, Abel, and Volhard and Fahr The chapter contains illumi

---

The reviews here published have been prepared by competent authorities and do not represent the opinions of any official bodies unless specifically stated

nating discussions of the different forms of Bright's disease. Following this chapter there are sections dealing with anatomic and physiological bases of the different types of hematogenous kidney diseases, with discussions of the various chemical and functional tests Then follows a short section on the theories of urine formation, with special stress on such modern concepts as contact and electrical potential and discussions of the important experimental and clinical studies of urinary secretion Succeeding sections cover the clinical aspects of the nephropathies, with competent discussions of such characteristic symptoms as hematuria, pyuria, renal hypertension, edema, and uremia There are adequate discussions of the course, prognosis, and treatment of kidney disease and special sections on the arteriosclerotic contracted kidney Dr Suter, in the final third of the volume, discusses competently the so-called surgical kidney affections diseases of the bladder, the prostate, the testis and epididymis, the seminal vesicles, and functional sexual disturbances

As in preceding volumes the book is attractively bound, the paper is of excellent quality, the typography is clear, and the accompanying charts and tables, including an elaborate list of foodstuffs with their caloric values and chemical composition are well-chosen and helpful There are gross and microscopic illustrations of the normal kidney and the nephropathies and some excellent colored illustrations of cystoscopic findings The literature is extensive, and there are good name and subject indexes The articles are clearly written and the work should serve not only as a textbook but also as a reference book

A Review of Medicine by Members of the Faculty Northwestern University Medical School Edited by Benjamin Boshes, M D M.S Ph D Associate Professor of Nervous and Mental Diseases Northwestern University Medical School Chicago Sixth edition. Cloth. $15 Pp 814 [University Bookstore Northwestern University] 434 E. Huron St. Chicago 11 1951

This large volume is essentially an outline of clinical medicine, including surgery, obstetrics and gynecology, and the various medical and surgical specialties intended to assist medical students in preparing for examinations and to provide interns, residents, and general practitioners with a ready source of reference for a wide variety of medical problems The value of the work appears to be established, since it has gone through so many editions over a period of 18 years

The first edition (1934) consisted of material given in a series of lectures at Northwestern to prepare students for the annual examinations for the Cook County Hospital internship Through subsequent editions new subjects and new sections were added, extraneous material was deleted, and the format was modified. A complete revision and reorganization was accomplished with the fourth edition, in 1940 This edition is, again, essentially a new book New sections have been incorporated, other sections have been rewritten, and many new names appear in the list of contributors This is neither a textbook nor a monograph Its original purpose and style remain It is an elastic compilation of data taught in the classrooms of Northwestern, each section written by a specialist The style of presentation usually follows a modified outline form, but some sections are in essay style The content has been brought completely up to-date

The book is large and bulky but the type is good, and the spacing adequate for quick reading There is a satisfactory index, but no bibliography and no illustrations For the student or intern who wishes to review for state board examinations, this volume will require supplementation since it does not contain sections on the preclinical sciences

Selected Writings of Sir William Osler, 12 July 1849 to 29 December 1919 With introduction by G L. Keynes, M D F R.C.S Cloth $4 Pp 278 Oxford University Press, 114 5th Ave New York 11 Amen House Warwick Sq , London, E.C.4 1951

One of the best things that could happen to a medical student would be to become interested in the life and work of Sir William Osler His influence on the medical profession is still strong although he has been dead more than 30 years His life provides a pattern that physicians could well follow While a bibliography of his writings would contain hundreds of items, in this book are collected only a few of his more or less philosophical essays These essays were chosen by a committee "to give the medical student a taste of Osler' They will find here, not the pathologist or the clinical professor, but Osler the essayist and historian The introductory chapter comprises an interesting but short biography

The Mark of Oppression: A Psychosocial Study of the American Negro. By Abram Kardiner M D and Lionel Ovesey M.D (Research on which this book is based was done with technical assistance of William Goldfarb Robert Gutman, Ethel D Kardiner and Zeborah Suesholtz.) Cloth $5 Pp 396. W W Norton & Company Inc. 101 Fifth Ave New York 3 1951

In the Mark of Oppression, Kardiner and Ovesey have given a psychodynamic analysis of Negro adaptation that furnishes a clear understanding of why Negroes react to many situations in the way they do This careful scientific study, using a new methodology, is a contribution to the study of behavior problems that is as important in what it reveals about other segments of the population as it is significant in evaluating the basis of Negro reactions According to the authors, 'This book is conceived and written as an inquiry not as a polemic It is conceived and written on the premise that group characteristics are adaptive in nature and therefore not in born but acquired '

The source material for this book is an intensive case study of 25 Negroes, all obtained by the psychoanalytic interview method An adequate basis for intelligent understanding and digestion of this material is presented in Part 1 The White Man and the Negro, A Comparative Sociology, The Social Environment of the White Man and the Social Environment of the Negro This in itself is a noteworthy and scientifically sound contribution Part 2 the personality studies of 25 Negroes drawn from the lower, middle, and upper classes, the adolescent and neurotic sampling give ample material for extensive elaboration

Rorschach test interpretations made by William Goldfarb substantiated the findings and hypotheses of Kardiner and Ovesey In the synthesis of experimental data, the authors make the following observation 'Nor must we overlook what is perhaps the most important lesson in this study The defects of adaptation that we have described, together with their social sources, make a dismal picture of human misery, one for which it is hard to find a parallel However, in spite of its defects when compared to white standards, we must not forget that in the face of such hardships it is a heroic achievement to be able to adjust and to survive The authors have often been amazed at the remarkable ingenuity and stamina that most of these subjects showed, and each of the authors has privately thought that under similar conditions of living neither could have done as well "

Kardiner and Ovesey have made a valuable contribution in a field in which they are recognized authorities They have also performed a signal service to mankind perhaps at present not fully appreciated

All who are interested in man and his relation to his fellow men can read this book with profit

Administrative Medicine Haven Emerson A. M M D editor New edition. Cloth. $10 Pp 1007 Thomas Nelson & Sons 19 E. 47th St New York 17 Parkside Works Dalkeith Road Edinburgh 9 1951

This book is intended to be used as a reference by medical administrators and by advanced students who are preparing for work as medical administrators It has the usual advantage and disadvantages of a compilation The breadth of its scope is such that no one person could have written it Dr Emerson had done well in the choice of the various experts who have contributed and he has succeeded in producing a harmonious whole The authors are men of actual experience in the field covered They are men of sane and conservative views and completely worthy to be considered experts in their respective fields Dr Emerson is well known as a man of sound judgment in matters pertaining to health and medical administration Any views that he may have sponsored in a book of this sort are well worthy of earnest consideration by those in positions of responsibility

Here is a book which should become a *vade mecum* on the desk of medical administrators So far as we know there is no other book available covering exactly this field in so complete a manner We recommend it highly as a well written, carefully planned and edited book loaded with useful information and sound administrative principles It should have wide use

QUERIES AND MINOR NOTES

REFRIGERATED BLOOD AND TRANSFUSIONS

To the Editor —*Is refrigerated blood as free of adverse reaction in the patient when given at room temperature or body temperature as it is when given directly from the refrigerator without preliminary warming? Does refrigerated blood cause any more reactions than warm blood from the donor?*

H S Puckett M D Stillwater, Okla

Answer —Refrigerated blood may be given to a patient, under ordinary circumstances by standard methods and at a normal rate (about 10 cc per minute) without fear of adverse reaction, even though the blood is not warmed to room temperature or to body temperature before administration Numerous measurements have shown that, by the time the blood has traversed the relatively long recipient s tube and the needle, its temperature has risen from the original 4 to 6 C, at which it may leave the refrigerator, to 15 to 20 C It is then warmed relatively rapidly as it flows into the body, so that there is no appreciable effect on the patient There is no evidence that increase in reaction rate results from this In fact, blood that has been kept cold up to the time of administration is probably safer, for if the blood is warmed too rapidly as in a water bath at over 40 C, there is greater likelihood that many of the cells, particularly those in contact with the glass, will be destroyed and a higher percentage of hemolysis will result One other danger is that, if the blood is kept standing at room temperature or in a 37 C water bath for a considerable time, any contamination that has occurred will permit the growth of organisms and lead to a serious reaction Even in patients with shock, there is no need to warm the blood

There are two possible dangers from the use of cold blood If the transfusion is given very rapidly as occasionally occurs on the operating table with the injection of a pint (473 cc) of blood at a temperature of 6 to 10 C within a period of 15 or 20 minutes, the patient s extremity into which the blood is running may be rapidly cooled and this may cause a mild sensation of chilliness Even under these circumstances, one rarely sees any signs of reaction The other possibility that has some times been considered serious is that if a patient has a high titer of cold agglutinins as after viral pneumonia the injection of refrigerated blood may allow such cold agglutinins (which occasionally are active even at 20 C) to produce clumping of the infused cells and result in a transfusion reaction It may, therefore, be advisable to administer a transfusion relatively slowly (certainly not over 10 cc per minute) to a patient known to have cold agglutinins, or if these are active even at room temperature, to warm the blood before transfusion

The common practice of heating the blood rapidly after it has been removed from the refrigerator, especially by immersing it in a pan of hot water, is to be avoided under all circumstances, because of the danger of destroying red cells by rapid changes in temperature or even heating in excess of 37 C Also the practice of allowing blood to stand for several hours at room temperature, until it is decided whether the patient is to receive a transfusion, should be avoided Finally, returning blood, once warmed, to the refrigerator should not be permitted Such drastic changes in temperature are likely to cause destruction or serious injury to many of the red cells, with loss of value to the recipient when such blood is subsequently used

ALBINISM

To the Editor —*Can anything be done to an albino child to improve his tolerance to light?*

F Vela Gonzalez, M D , Monterrey, N L , Mex

Answer —Complete albinism results from congenital absence of pigment throughout the entire body The skin is milky white or has a pinkish tinge, the hair is white or whitish yellow, and there is a similar deficiency of pigment in the eyes The iris has a dull, pearly gray appearance, and the pupil may appear red in natural light Unfortunately, because of the absence of pigment, nothing can be done to improve tolerance of an albino child to light Standard textbooks make such statements as the following As may readily be inferred, albinismus cannot be lessened or influenced by treatment—it is, in fact, without remedy ' The only measures that are helpful are protection of the skin from excessive exposure to sunlight and especially protection of the eyes from excessive amounts of light by use of sun glasses

ATROPHIC PHARYNGITIS

To the Editor —*A woman, 66, has complained of dryness of her throat for four months Her family physician has prescribed every antibiotic and other type of lozenge available on the market with no effect When I saw the patient two months ago the posterior pharyngeal wall had a dry glistening appearance, with obvious atrophy of the mucosa and some small, reddish granular nodules I have seen this condition frequently in elderly women Is this an atrophic pharyngitis on the basis of an endocrine disturbance or a degenerative process?*

M D Massachusetts

Answer —In atrophic pharyngitis (pharyngitis sicca), an entity often associated with atrophic rhinitis, the posterior wall of the pharynx has a lusterless glazed appearance in mild cases and there is advanced atrophy of the mucous membrane with dry crust formation and fetor, in advanced cases The patient afflicted with atrophic rhinitis has a sense of considerable dryness in the throat To dislodge the adherent secretion on the posterior pharyngeal wall, some patients will make frequent attempts to clear the throat by hawking retching and sometimes by vomiting Consequently, a chronic sore throat is not an unusual accompaniment Although the cause is unknown, occasionally an endocrine relationship is suggested by the basal metabolic rate In elderly patients a more plausible explanation is that the disease is due to a degenerative process

As in the case of atrophic rhinitis, treatment is directed toward the alleviation of symptoms, since it is currently impossible to regenerate atrophied pharyngeal mucous membrane Medication is similar to that used for chronic pharyngitis In conjunction with treatment of atrophic rhinitis if this condition is present treatment of the pharyngeal wall may include the local application of Mandl s solution or tincture of iodine in glycerin (1 to 7 parts) These preparations stimulate secretion At the same time, potassium iodide may be given internally An average dose is 10 drops of a saturated solution, to be taken three times daily with meals The inspiration of warm, moist air from a kettle, vaporizer or basin helps moisten inspissated secretion Attention to general health should, of course, receive consideration

FAILURE IN SENSATION FROM BLADDER DISTENTION

To the Editor —*A patient has no sensation of the need of emptying the bladder He knows when the bladder is full only by feeling the end of the penis and when in bed by a pain in the left hip I shall be grateful for suggestions for treatment in such a case*

Louis L Sherman M D , Oakland, Calif

Answer —Failure in sensation from bladder distention occasionally is observed as the first clinical sign of lesions involving the spinal cord Among the possible diseases that might be mentioned are tabes, multiple sclerosis, neoplasm, and other lesions involving the central nervous system In the absence of any other clinical data it is impossible to make an exact diagnosis in this case or to advise treatment The services of a competent neurologist are recommended, who, with the help of roentgenologic, urologic, and other data, could give accurate counsel

---

The answers here published have been prepared by competent authorities. They do not however represent the opinions of any official bodies unless specifically stated in the reply Anonymous communications and queries on postal cards cannot be answered Every letter must contain the writer s name and address but these will be omitted on request

PAROXYSMAL AURICULAR TACHYCARDIA

To the Editor—*Since childhood I have been troubled with recurrent paroxysmal tachycardia I am now 75 years old Often, in turning my head to the left, a slight fainting feeling results Just before and during the attack the right carotid sinus region pulsates much more than does the left Pressure on the carotid sinus does not stop the attack Before an attack, there is a weak feeling in the umbilical region and little, if any, signs or symptoms in the region of the heart There are no anginal or coronary obstruction symptoms and none of any organic heart lesion Blood pressure is a trifle above normal Would procaine hydrochloride injection be indicated in the right or left carotid sinus if the attack lasts too long? Can you suggest any treatment to stop that abdominal starter from starting the auricle at double speed? I use cinchona alkaloids whenever needed I eat five small meals a day because I have noticed that a large meal (or a large evacuation) helps start an attack, especially in the morning Please suggest treatment and prevention*

M D Oklahoma

Answer —Any patient who has a history of recurrent attacks of rapid, regular heart action, setting in suddenly, having been present since childhood and displaying no evidence of organic heart disease, may be considered as having paroxysmal auricular tachycardia Procedures such as pressure on the carotid sinus, pressure on the eye ball, the induction of gagging or vomiting, and attempted expiration with a closed glottis (Valsalva's experiment) may be often successful when used singly or in combination When these measures fail and the tachycardia persists for hours, digitalis, quinidine or the highly potent mecholyl (dangerous in infants and elderly subjects) can be tried There are also favorable reports on the use of neostigmine and phenylephrine (Neo-Synephrine®) hydrochloride Procaine injection to the upper thoracic ganglions has been used in several instances, but it does not always stop the attack

The purpose of all these measures is to stimulate the vagus or inhibit the cardiac accelerators Injection to the carotid sinus would not serve such a purpose One of the triggers in bringing on the attack is overdistention of the stomach or hypoglycemia Nothing better than frequent small meals can be suggested Self-medication is fraught with danger

LEUKOPLAKIA BUCCALIS

To the Editor —*A man, 57, has had leukoplakia buccalis for about half a year It is especially pronounced on the left side of the tongue and cheek It subsides somewhat after he abstains from smoking for a couple of weeks and becomes more pronounced a few days after he resumes smoking Is smoking absolutely to be prohibited? What are the possibilities of the formation of a cancer? Is any therapy indicated?*

Samuel Barmak, M.D , Brooklyn N Y

Answer —Leukoplakia is a clinical term meaning "white plaque" It is the response of a mucous membrane to some form of chronic irritation Smoking occasionally causes such a lesion The case of which you write seems to fit this category Certain forms of leukoplakia are considered to be "precancerous lesions " When following microscopic examination the pathologist reports leukoplakia he usually means more than a simple white spot namely, there is evidence of dyskeratosis A biopsy is indicated in any lesion that seems at all suspicious, particularly in those in which any thickening is found

PROSTATIC HYPERTROPHY

To the Editor —*Have estrogens or other hormones been tried to prevent hypertrophy of the prostate? Since estrogens are helpful in cancer of the prostate, it might be logical to use them in hypertrophy*

J Minkin M D Bronx, N Y

Answer —There is no way to prevent hypertrophy of the prostate Hormones have never prevented or cured benign hypertrophy of the prostate, they have, however, been of great value in the treatment of cancer of the prostate

A "SIXTH" LUMBAR VERTE

To the Editor —*An x-ray report was nosis of 6 lumbar vertebrae, and ver* tion *taken of only the lumbosacral area, without view One specialist without making a coun vertebrae, said that since there were six vertebra* Trustees *appearance of lumbar vertebrae, the diagnosis was Indeed there were six visible vertebrae without evidence any rudimentary rib structures We would all like to know the criteria for making such a diagnosis and whether if only 11 vertebrae with articulating ribs are shown by further x-ray studies, the vertebra in question should be called an extra lumbar or a 12th dorsal sans rib attachments*

Don Dieter, M D Salina Kan

Answer —The question as to the criteria for diagnosing a sixth lumbar vertebra is really a question in semantics rather than in radiology or anatomy, and if one is worried about it he can avoid the difficulty by substituting the term non rib bearing presacral vertebra' The idea that an examination of the entire spinal column will resolve the difficulty is not sound and it is an expensive procedure that ought to be avoided if possible If a patient is found to have six non rib bearing presacral vertebrae and a short sacrum, it is common to describe the lowest nonsacralized segment as a lumbarized first sacral If the sacrum appears to be of normal length the extra segment is usually described as a sixth lumbar

RUSTY NAIL WOUND

To the Editor —*What is the best local treatment for a puncture wound of the sole of the foot by a rusty nail? The nail entered to a depth of a quarter of an inch and no complications have set in*

M D California

Answer.—Bowen (J A M A 119 413 [May 30] 1942) recommended the following treatment 1 The foot is to be soaked for 15 to 30 min in hot water to which tincture of soft soap is added 2 It is dried carefully, and an area about 2 to 3 in (5 08 to 7 62 cm) in diameter around the wound is painted with an appropriate antiseptic 3 The top layer of the skin is cut away around the wound, resulting in exposure of foreign matter (usually sand, rarely particles of sock, leather, rubber or concrete), which can be removed easily 4 A dry dressing is applied 5 If the wound is caused by a nail larger than a ten penny nail, the patient should not walk for at least one or two days, but if a nail of lesser diameter is involved, he may walk at once

In addition to the above local management, the appropriate use of tetanus antitoxin and tetanus toxoid (Skin Test Technic, Queries and Minor Notes J A M A 139 68 [Jan 1] 1949) is indicated Too much reliance must not be placed on the local and parenteral use of penicillin to prevent tetanus

POLYCYSTIC KIDNEYS

To the Editor —*A patient 52 has polycystic kidneys Her nonprotein nitrogen has been consistently normal despite the fact that x rays show considerable diminution of kidney tissue Blood pressure is normal there is no edema the daily amount of urine is normal and body weight remains constant The patient seems in good health Textbooks are vague on the subject and give a gloomy prognosis Can you suggest anything in the way of treatment?*

M.D Florida

Answer.—This patient has a good prognosis in view of her normal blood pressure and blood nonprotein nitrogen at age 52 If she is asymptomatic, there is no reason for any specific treatment for polycystic kidneys Renal function should be checked from time to time, so that necessary dietary adjustments may be made The urine should be watched for evidence of infection or hemorrhage If the former occurs antibiotic therapy is indicated varying with the nature of the micro-organism Persons with polycystic kidneys may achieve a normal life expectancy if renal function is well preserved into the sixth decade

REFRIGERA ATED

To the E tion possibility of the lice through skin toclaving our skin of the blade We at our corks became known to be effective other disadvantages? A Company, extolling the ctant, has suggested the erial might be adequate

, Santa Barbara, Calif

van Rooyen (Textbook of Virology son & Sons, 1949) state that virus-contami be sterilized by immersion in chemical solutions, gators believe that such measures are not adequate ain destruction of the viruses, particularly in the presence of organic substances

Neefe (*M Clin North America,* Philadelphia Number, November, 1946) reported that the virus of homologous serum jaundice, in human albumin, is inactivated by heating for 10 hours at 60 C (140 F) Heat is therefore recommended for the disinfection of blood-contaminated lancets, needles, and syringes, despite its deleterious effect on the temper of the metals The piercing properties of lancets and needles are easily restored by use of an emery stone The straight Hagedorn No 6 needle is probably more adaptable to reconditioning than is the type of blade indicated above The point of the lancet should not be inserted into a cork during disinfection or sterilization procedures

Immersion of previously cleaned instruments in boiling water for 15 minutes will destroy the virus of homologous serum jaundice Dry heat sterilization requires a longer interval at a comparable temperature Specific procedures employing heat disinfection of lancets, needles, and syringes are described in The Journal of June 11, 1949, page 579, and Dec 2, 1950, page 1226

CALCIFICATION OF SOFT TISSUES

To the Editor —*A man, 50, has calcification of the tissues of one hip as indicated by x-rays The hip was a little swollen, but there was no pain In the course of his work, he repeatedly strikes this part of his body against a machine Please advise whether any treatment is available* *M D, Connecticut*

Answer.—Calcification of the soft tissues around the hip is rather infrequently seen If the calcification is lateral to the greater trochanter, it may represent calcium deposits in the trochanteric bursa, which is similar to calcium deposits in other bursa of the body, particularly in the region of the shoulder Sometimes these respond to x ray therapy, but occasionally surgical excision is necessary for the eradication of the condition But, assuming the patient is having no pain and the diagnosis is definitely established as bursitis, probably no treatment would be necessary If the calcium is deposited elsewhere, particularly around the neck of the femur, it probably is a case of calcification of the muscles and might be the forerunner of myositis ossificans However, without having an opportunity to review the x-rays, it is impossible for one to make an accurate diagnosis

DUOCHROME REFRACTION TEST

To the Editor —*I desire information on a method used in refraction of the eye, to see if the prescription is correct In this test, red and green letters are shown the patient wearing the glasses if he sees one of the colors best, he is supposedly on the myopic side if the other letters are seen best he is on the hyperopic side I have not been able to find this information in any book at my disposal*

L Murphy Henry, M.D, Fort Smith, Ark

Answer —The emmetropic light adapted eye is most sharply focused for the spectral color of highest luminosity, which, for the average eye is yellow of 555 mμ wavelength When thus focused, red and green rays at equal wavelength distance from this point of the spectrum form aberration disks of equal diameter This observation, made by Helmholtz, is the basis of the original duochrome refraction test introduced by Clifford Brown of London in 1927 and described by H H Emsley (Visual Optics, London, Hatton Press, 1936) The application has been simplified in the projectochart apparatus, which contains an accessory transparent slide, half red and half green of the proper hues When in use the visual chart is divided laterally by superimposed red and green light The eye, if emmetropic or made so, sees the letters equally well on both backgrounds, but, if excessive plus power has been added, the letters on the red background will be in focus nearer to the retina and will be seen more clearly than the letters on the green background and vice versa The indication, therefore, is to add minus power if the letters on the red background appear clearer and plus power when the letters on the green background are the more distinct In the brochures furnished by manufacturers of projectocharts, this technique is fully explained Following a suggestion of Maddox, Lebensohn has adapted the duochrome principle to the near vision test chart as a help in the precise determination of the presbyopic addition (*Am J Ophth* 32.22 [Jan] 1949)

AMENORRHEA FOLLOWING MISSED ABORTION

To the Editor —*Why does a woman suffering a missed abortion not menstruate, even though the condition may go on for months or years? I am anxious to know the various opinions that this question should bring forth* *M D, Illinois*

This inquiry was referred to two authorities, whose respective replies follow —Ed

Answer —In missed abortion with death of the fetus, there still may be placental tissue attached to the uterus, which may give rise to enough estrogen production to suppress menstruation

Answer —The endocrinal mechanism that regulates cyclical activity in the ovary and reproduction is only partially understood Following is the most reasonable and current explanation In the normal cycle, FSH from the anterior lobe of the pituitary gland stimulates follicle growth Prior to ovulation a widespread atresia of the secondary follicles occurs, which eliminates all except the dominant follicle and provides a spurt in estrogen production which stimulates the release of LH by the pituitary This gonadotropin induces ovulation of the dominant follicle and corpus luteum formation The life of the corpus luteum is about 14 days, and its regression results in a drop in the level of estrogens and progestin which brings on menstruation

If pregnancy occurs, chorionic gonadotropin elaborated by the young conceptus prolongs the life of the corpus luteum until such time as the placenta is sufficiently developed to take over the production of the steroid hormones Experimentally, chorionic gonadotropin administered to a woman during the progestational phase of the cycle will postpone menstruation 10 days or longer, because the corpus luteum remains functional

After the death of the embryo in missed abortion, viable chorionic tissue may continue to produce progestin for many weeks This can be followed by the quantitative determination of urinary pregnanediol When the pregnanediol output has reached a low level or disappears completely, the uterus usually expels its contents The disappearance of progestin allows the LH factor in the pituitary to again assert itself, and follicular activity, ovulation, and menstruation are resumed

MUSCULAR DYSTROPHY

To the Editor —*What should be done in the way of supportive therapy in muscular dystrophy? Is intensive physical therapy requiring hospitalization beneficial?*

Warren G Strout, M D, Pittsfield Maine

Answer —Unfortunately, no form of treatment is of value in cases of progressive muscular dystrophy There is no evidence that physical therapy has any beneficial effect Certainly there would be no justification for hospitalization and intensive therapy of this type

NEUROLOGY AND HUMAN EMOTIONS

CHAIRMAN'S ADDRESS

Louis J Karnosh, M D , Cleveland

In the family of medical specialties, clinical neurology has often been regarded as a sibling whose duty is to play an ancillary role to its nearest kin, psychiatry, internal medicine and neurosurgery It has been facetiously called a fading spinster living in a back bedroom and walking with a soft and gingerly tread Compared with the lusty, brilliant and occasionally fustian activities of modern psychiatry, contrasted with the brisk, youthful and productive efficiency of neurosurgery and with the dramatic urgencies of internal medicine, the demeanor of clinical neurology, until in very recent years, has bordered on the lustreless

This is reflected in the impressions entertained about neurology by the public To many a man-on-the-street be he well-informed about medicine or otherwise the specialty of neurology is not clearly defined or even known to exist as such Very few neurologists have escaped being confronted by this most disconcerting question, "If you are not a brain surgeon or a psychiatrist, then just exactly what sort of a brain specialist are you?"

This seeming modesty on the part of neurology and its desire to keep out of the glaring limelight, while creditable from the standpoint of ethics, is often not entirely a virtue, for it can be a device for concealing certain shortcomings and a cover for an undesirable timidity, reticence or even inertia

Perhaps, a good example of the "gingerly tread" of clinical neurology is its attitude toward committing itself in a concerted manner on the anatomy, physiology, and pathology of the emotional nervous system In this day when people are informed in every popular magazine that the emotional problems of man are productive of more misery than all other human ailments combined when the chief casualties of modern wars are emotional disturbances, neurology has, with one or two notable exceptions, remained almost in a state of "akinetic mutism" in reference to this particular subject

This charge, if it be accepted as such, does not imply that neurology should stoop to cheap opportunism and produced a flood of empiricisms about the anatomy and physiology of the emotions However, it seems that it is the duty of this specialty to organize and correlate its available, authentic data on the emotions and to submit them, however incomplete, to both the practising physician and the educated layman, if for no other reason than to temper rank misconceptions and absurd misapplications The immense popularization of medical knowledge has made many laymen more intelligent and unhappily, in direct proportion, often more credulous The conservative contributions of neurology to the story of human emotions should be an antidote to that credulity and, in a measure, should offset the bad influence of misguided theories and practices dealing with emotional disorders An excellent example of this approach to the organic story of the emotions is the recent publication by Dr Stanley Cobb [1] of his book entitled "Emotions and Clinical Medicine "

The intelligent layman is here to stay He is interested in the specific mechanisms of the brain as much as, if not more than, he is in what is, through metonymy, called mind He is as anxious to know where and how emotions operate as he is to learn how and why hydrochloric acid is produced in the stomach In spite of the current emphasis on unity of mind and body, he remains aware of his emotions as an experience apart from his intellect and his body functions He is aware of the potent effect of his emotions on his behavior, he senses them as a distinct and powerful internal process and, in a vague manner, he knows of their impact on his visceral organs

In all this setting of desire on the part of both physician and layman for knowledge about how man emotes and about what structures in the brain and what physiological devices therein produce emotions, practically every standard text on neurology says nothing Out of 10 textbooks on basic and clinical neurology, the word "emotion" was found in the index in only two of them, and the references were single ones In two outstanding texts on neurophysiology, that word was indexed with two references, and both had to do with a brief comment on vascular reflexes and hypothalamic discharge, one of these harking back to Sherrington's work in 1900

In other words, if one is to be guided by modern texts in neurology and neurophysiology, one is justified in concluding that the emotions have no major representation

[1] Cobb S Emotions and Clinical Medicine New York W W Norton & Co Inc 1950

in the central nervous system and, what is more puzzling, that organic diseases of the emotions do not exist This nihilistic notion denying an organic substratum for the emotions is carried over into clinical practice where the very term "emotional disorder" invariably connotes a functional disease Psychosomatic medicine has done little to change this concept, for it has emphasized that the primary factors are always psychogenic and has conceded a pathology only in the end organs controlled by the autonomic nervous system The two most popular treatises on psychosomatic medicine offer very little on the integration of emotions in the central nervous system, only one of them stressing the significance of the hypothalamus

The neurologist's reticence in committing himself about emotional anatomy and physiology could be explained by several factors, most of which are my own speculations and interpretations

First, the neurologist, no matter how much he may deny it, is inhibited by the old concept that to accept emotions as stemming from a true neural mechanism is a threat to the sanctuary of integrality of mind The doctrine of mind as an indivisible whole is cherished by all schools of psychology and by many psychiatrists for the simple and very practical reason that their techniques lend themselves only to handling the human mind as a nonfractionated unit Few neurologists have ventured to defy this creed of integrality of mind It still takes a special courage bordering on academic recklessness to suggest a purely neural or engram basis for mind and emotion in human subjects, when it is known that such a venture will be assailed by the proponents of "personality as a whole" on the one hand and by ultracautious experimental neurophysiologists on the other

A second factor in causing neglect of the clinical study of human emotions is inherent in the very nature of emotional behavior, probably the greatest deterrent of all Self-observation of emotional behavier is useless, an impassioned person is too much "beside himself" to study his emotions, and when reflection and insight are good, there are no passions to study Since the first reports of Lange, the life of feelings remains an elusive thing to the discriminative elements of mind Nor are objective emotional reactions in others any more readily recognized The motor expression of emotions is so spontaneous, so infectious, and so liable to interpretation as a total mass pattern conveying a particular inner feeling, that, intrinsically, the analysis of a particular muscular activity is rarely possible For one human being to make a cool and detached observation of spontaneous emotional behavior in another requires an unusual temperament and special techniques which are difficult to apply

A third handicap in the neurological analysis of emotional integration is the wide gap which exists between human and animal brain physiology Experimental neurophysiology has produced a vast amount of data on the emotional nervous system but has been too cautious about recording it as such Piecemeal, the experimental results have been presented in the guise of rage reactions, grimaces, akinetic mutism, poverty of animation, absence of generalized movements, lack of defensive movements, postural rigidities, respiratory arrhythmias, and a wide array of autonomic discharges, all of which can be called expression of emotional activity It can also be said that animal experiments on emotions are too objective, while experiments on humans are too subjective, and the results of the two are almost impossible to synthesize

Finally, there is a fourth factor which retards more complete knowledge of emotional neurophysiology and pathology It is the unique anatomical complex which is the nexus of the emotions This term "nexus," which means a bond or tie between the several members of a group or series, is used advisedly in order to avoid the term "center of the emotions" which is eschewed by all good neurologists The nearer the experimental neurophysiologist gets to this nexus or even the nearer he gets to something which could be regarded as a center, the more he finds himself dealing with a primordial nervous system that knows no nicely myelinated tracts, no clearly defined nuclear masses, but, instead, a veritable bramble bush of reticular and nonmyelinated maze Here he also finds cortical, subcortical and bulbar pathways of meagre structure involved in elaborate circuits which seem to know no end The matrix of reticular and tiny nuclear tissues has been successfully penetrated only by the stereotaxic apparatus first devised by Horsely and Clarke, only few modifications of which have so far been applied to humans, namely, in the study of the thalamus by Spiegel [2] and his associates In animals, the experimental results in terms of emotional physiology are merely tidbits of information which can be assembled only with painful care and with all the misgivings of academic doubt and experimental groping

These constitute the main handicaps which furnish the neurologist an apologia for failing to bring forth a clear understanding of the organic basis of the emotions

The reflections recorded here are not a scholarly ensemble or the results of highly organized experimental work, but are rather the homely observations of everyday practice in clinical neurology

For the sake of semantics and clarity of what is meant by emotion, the sublimely simple definition of Professor John R Reid in the preface of Cobb's book is offered at this juncture "Both the feeling and the behavior that expresses it, as well as the internal physiological responses to the stimulus-situation, constitute a dynamically interrelated whole, which is the emotion " To the neurologists, therefore, there are three phases of emotion (*a*) the subjective private feeling, (*b*) the discharge into the visceral nervous system, and (*c*) the motor component in bodily, overt behavior

SUBJECTIVE PHASE OF EMOTIONS

On the subjective side of emotion, animals give us too little data and humans too much or, more accurately, too much elaboration of pure, primal emotion

Neurologists should consider the meaning and significance of the term cenesthesia, which is found more often in foreign medical treatises than it is in those of this country Cenesthesia is the general feeling of being in the body or of bodily consciousness without reference to any part or any specific sensation. It can be said with axiomatic conviction that to be conscious of any extraneous stimulus, one must first be conscious of oneself as a total diffuse sense of merely being Cenesthesia therefore, can be called the irreducible level of all consciousness No outside stimulus reaches any level of consciousness unless it is infused with this element of cenesthesia

---

[2] Spiegel E A. The Central Mechanism of Emotions, American Psychiatric Association Annual Meeting Cincinnati May 7 11 1951

How cenesthesia is created is or should be one of neurology's most urgent problems Whether the homeostatic centers of the hypothalamus furnish it through their humoro-sensitive capacities rather than through afferent systems from the viscera is still an open question Verney's [3] demonstration of osmoreceptors in the supraoptic nucleus for maintaining water balance suggests the possibility that other unique receptors participate to synthesize basic feeling tone in the hypothalamus Destruction of the caudal portion of the hypothalamus by Bard [4] and later by Bailey and Davis [5] led to the production of mutism and akinesia, particularly of faciovocal activity This inspired Nielsen and Thompson [6] to regard these cells about the upper aqueduct as the centers of conation and as the origin of drive to maintain all tissue optimum by infusing the organism with primal animation, feeling and crude psychic energy

Few neurological entities in man are encountered when basic feeling or perception of emotional tone is modified by focal anatomical lesions It is usually assumed that extraneous stimuli are not merged with cenesthetic consciousness until they reach the thalamus and, specifically, its primary receptive field, the ventral posterolateral nucleus Lesions in this nucleus in man are not uncommon because of thrombosis of the geniculothalamic artery, and they produce the well-known syndrome of Déjerine and Roussy with its familiar disruption of sensory thresholds

The ventral posterolateral nucleus of the human thalamus is something more than just another sensory synapse Therefore, lesions in this area offer an interesting study of emotional disruption on the subjective side which merit more investigation than they usually get The main difficulty is the patient's inability to express emotional experiences in terms of clear, discriminative language As every neurologist knows, in this thalamic syndrome, light touch when applied in a dragging manner along the skin, produces an angry, permeating disagreeable sensation invoking an emotional response which ordinarily belongs to a pain stimulus Paradoxically, a pain or deep pressure stimulus may actually produce a feeling of relative relief or pleasure The peculiar, qualitative experiences which perfuse the entire half of the body when a non-noxious stimulus is applied, are called hyperpathias

Ten patients studied by me have recorded their inward feelings about hyperpathia as an "inward frenzy affecting one half of the body," as an "angry feeling without good cause," as an absurd "hemiemotionalism" and as a "hemiagitation bordering on a shrieking hysteria " In all 10 patients, this hyperpathia was mild or totally absent in the trigeminal distribution

The agitated hemiemotionalism in two patients with the thalamic syndrome could be provoked by special sensory stimuli, such as the auditory nerve In one patient, the distress was precipitated by the sound of his wife's vacuum cleaner and in another, by the grating sound of silverware on this plate, which required the use of wooden eating utensils

Perhaps the best elucidation of the distorted effect in the Déjerine-Roussy syndrome was offered by a most intelligent and cooperative professional man of 58 years a judge in a district federal court, who had excellent command of English and was unique in his ability to express the finer nuances of inward feelings The hypesthesia-hyperesthesia paradox involved his right side He had the typical, uncomfortable reaction to light touch, which induced an "inarticulate frenzy" on the same side When he was angered by any disconcerting psychogenic situation, this permeating, indescribable wave of distress spread from the neck to the toes of the right foot, "as if a house current of 110 volts were passed through the same side of the body " On the other hand, whenever he was taken up with some deeply sentimental and pleasant feeling, such as that provoked by the surprise visit of a favorite married daughter from California, he became acutely aware of the pleasurable emotions of the occasion as a half-body experience involving only the intact left side He recalled such a hemiemotionalism on the pleasurable side at least a half-dozen times

Another patient in this series amused the junior physicians with his persistent claim that in his erotic pursuits he could clearly sense the feeling of passion in only the intact half of his body, an anatomical cleavage which even included the external genitals This was regarded as a bit of imaginative whimsy on the part of the patient until, on further inquiry, three other male subjects admitted to the same peculiar hemieroticism and two patients after right hemispherectomy reported the same "dissociation of pleasure "

These unique examples of what can be called a hemiemotionalism or hemipassion are found only in lesions of the ventral posterolateral nucleus in humans It is believed to be due to a localized release from diencephalic and cortical control of the thalamus From Spiegel's extensive thalamotomy experiments, we know one cannot say that there is a single thalamic center of emotions However, this nucleus does produce a distinct anatomical dissociation of feeling function and thereby furnishes one useful clue in the organic studies of emotional synthesis

AUTONOMIC PHASE OF EMOTIONS

Adhering to Reid's definition of what constitutes an emotion, the second phase deals with the concomitant discharges in the emotional experience which take place in the visceral nervous system This phase of emotional physiology lends itself to the easiest and most reliable objectivity Along with the excellent pioneer investigations of Pavlov and Cannon, the mass of data available today is largely due to the enthusiasms of psychomatic medicine and is too well known and too comprehensive to allow for any comment in this strictly neurological discourse

MOTOR PHASE OF EMOTIONS

Far more intriguing are the recent advances in the study of the motor, or expressive, phases of the emotions It is an interesting commentary that after Charles Bell[7] described amimia in 1806, after Duchenne's[8] electrical stimulations of facial expression, in 1862, and after Darwin[9] wrote his "Expression of the Emotions in Man and Animals" in 1872, there was a notable lack of interest in pursuing the study of the motor side of the emotions This was in spite of the observations made long before by Parkinson,[10] who established a clinical entity noted for its defect in spontaneous emotional animation Because clinicopathologic correlations in almost all types of parkinsonian rigidity are obscured by the diffuse nature of the cerebral lesions, no one could venture an exact opinion on the role of the basal ganglions in emotional expression, particularly when their direct stimulation showed these nuclei to be relatively inert

In the modern neurophysiological concept, the function of basal nuclei in emotional expression is not denied They are not primal centers but play an elaborating role in the so-called reverberation circuits These are devices which allow an interplay of suppressor and facilitative mechanisms which involve the thalamus, the sensory cortex, the suppressor area 4s, the premotor and motor areas as well as the striatum and pallidum

Another complex of structures which modify and elaborate emotional display is that proposed by Papez[11] who introduced an elaborate integration by way of the gyrus cinguli and much of what is called the rhinencephalon, all these mechanisms acting on the hypothalamus

All these rather convincing theories about the emotions are difficult for the clinical neurologist to apply because of the elaborate and widely dispersed neural mechanisms involved The latter somehow fail to qualify as fundamental centers of emotional expression, as primary structures for the discharge of those spontaneous, massive, postural and facial activities which are considered direct expressions of pure feeling

Neurology has been looking for something like a "final common pathway" for emotional expression It is a safe premise that such a mechanism is phylogenically old and will be found in a very old motor system in the brain Bell sensed it when he drew attention to the facial muscles as the best expressers of human feeling and that the stimulus for facial expression arises from a primitive portion of the motor system He first drew attention to the simple fact that patients can have a voluntary weakness of one angle of the mouth, but in spontaneous laughter or grimace the facial activity is complete He also mentioned that the opposite condition can occur and therefore concluded that voluntary control and emotional control of the face arrive from different motor centers Even in the preexperimental and purely empiric days of Darwin, the latter recognized that the emotions are discharged through phasic postural states of the body, through respiratory activation, and, in human beings, essentially through plastic activities of facial muscles

The motor side of the emotions, then, is primarily a complicated synthesis of posture, respiration and facial activation No structures above the hypothalamus when stimulated in the experimental animal have duplicated a complete motor emotional ensemble Not until the stereotaxic apparatus began to probe more accurately into the reticular formation of the brain stem were there evidences of something like primary emotional expression or absence thereof This reticular formation occupies the tegmentum of midbrain, pons and medulla and has its caudal portion in the posterior hypothalamus

In brief, this reticular substance is functionally divided into a repressive and a facilitative system It is this latter structure, now often referred to as a reticular activating system, which appears to promote a quick, natural, fluidlike expression of feeling with such movements as grimacing, licking, grasping, turning, progression patterns of the arms, easy and almost reflexive faciovocal activities, all of which Darwin found to be expressions of emotional tone

Recently, Ward, McCulloch and Magoun[12] finally produced the completely deemotionalized animal when they made electrolytic lesions at the base of the tegmentum, extending from the midbrain to the lower pontine level Along with this synthetic parkinsonian rigidity, they also reproduced the static tremor typical of the disease

In human beings, the neurologist may occasionally encounter a lesion restricted to the brain-stem reticulum which allows fairly accurate clinicopathologic correlations Such a lesion is usually the spongioblastoma of the reticular substance of the pons or medulla, which has not extended into tectal or ventral structures I studied five such patients clinically Amimia was found to be most severe in these patients and was the very first localizing symptom in two of them Parkinsonian symptoms, such as rigidity, tremor and asynkinesia appeared in two, one an adult of 42 and another a girl of 11 years Both were thought to have von Economo's encephalitis, although I should have known better than to expect an encephalitic parkinsonism in a child of 11 Naturally, all these patients were eventually overwhelmed by a bulbar palsy which utterly obscured the akinesia, emotional impoverishment, and postural rigidities which theoretically are caused by a destruction of the facilitative tracts in the brain-stem reticulum

It is doubtful whether all the specific emotional patterns are fabricated in this "semifinal" common path even if we include the most caudal portions of the reticular formation and the central gray substance in the posterior hypothalamus Stimulation of the latter structure in cats produces the rage reaction, but when the primate is subjected to the same test, the result is not the same We must concede that it requires more than reticular substance to compound and fabricate the emotions Consideration must be given then to the physiological and anatomical formulations of Papez, as well as to those engrams which involve the suppressor centers in the cortex and their connections with the basal nuclei, the thalamus, and hypothalamus, which are so expertly summarized in a paper by Lindsley, Schreiner and Magoun [13]

These sporadic samplings of both experimental and clinical study do not indicate that the neurologist is ready to submit a good organic engram for the human emotions But the data are more complete than most medical minds believe, and there is a distinct demand for a candid and careful listing of all the material now available The neurologist must do his part in establishing the emotions as part of a physical mechanism upon which the psychologist and psychiatrist can construct their own formulations

Even the psychologist,[14] who is usually wary of the biologist, in his most quasi-philosophical moods admits that "susceptibility to any kind of emotional arousal is in a significant way a function of the sturdiness of the (anatomical) structures that direct and regulate the life of the individual No psychology of emotion is complete without an account of these structures "

The anatomy and physiology of the emotions must not remain in a crepuscular zone They will be fully understood only after we have developed methods of describing and plotting the essential structures and relationships both subjective and objective, of which the emotional mind is composed

ARE YOU AN OTOLARYNGOLOGIST?

CHAIRMAN'S ADDRESS

James Milton Robb, M D , Detroit

By this simple direct question is meant are you a good practitioner of laryngology, otology and rhinology? This question really does not apply to and probably will have little practical interest for the superspecialists, those men who have perfected special techniques in one or two phases of this work and have limited their practices thereto This paper is primarily intended to call to the attention of the young man about to choose his life work the importance of the specialty, its scope, the opportunities it affords, and the pleasure of its practice and to offer a challenge to the man already traveling this high road

These superspecialists are in truth the research men in medicine and surgery of the nose, throat, and ear What a blessing to us! They clarify our minds as to the proper method of attack in these areas We could not do without them, for not only do they serve for reference but they also act as spurs and stimuli to the general practitioners of otolaryngology

The broad field is our job, broad not in the physical sense but in the complexities of this small but vital area And it is a much more responsible job than is often thought A thorough knowledge of the embryology, physiology, anatomy, and pathology of the nose, throat, and ear as well as of the face, mouth, and neck is required, for rightly the otolaryngologist should take care of the cysts, fistulas, and tumors of teratological origin in this field

Otolaryngology is a specialty in its own right, an important one and should not be considered a part of any other Sometimes a practitioner may find it necessary to combine the practice of otolaryngology and ophthalmology because of the practicability of this service to the smaller communities We all know this is not ideal, but it must be done And it can not be emphasized too strongly that in these cases adequate training in each specialty should be taken Neither should be sacrificed to the advantage of the other Whether you have chosen ophthalmology or otolaryngology or a combination of the two the national leaders in these fields have long recognized the value of intensive training beyond the walls of colleges and universities Home-study courses have been available for some time, and the annual classes offered by the American Academy of Ophthalmology and Otolaryngology afford the opportunity of intensive study—refresher courses that not only educate but stimulate It is impossible for any one to keep clearly in his mind the embrylogic and anatomic relationships of this area unless he is constantly thinking, studying, scanning

So small the area! So vast the field! Through this gateway, the nose and mouth, enter all types of infections whose foci may interfere with normal health and function in distant parts of the body And, conversely, the membrane of the nose affords barometric readings of the storms in the general system, for upon it are recorded the results of biochemical and autonomic nervous-system changes Thus the otolaryngologist must practice medicine, surgery, or a combination of the two

I flatter myself that I am an otolaryngologist and have been that for more than 40 years in an urban center in the Middle West A continuing practice from this laboratory, with more than one generation of human beings as the object of my efforts, I believe has proven the efficacy of these findings concerning the field In the following part of the paper I will discuss a few of the more important practices of otolaryngology

The tonsil has been the most persistent target of both lay and professional writing Whether to operate? When to operate? How to operate? And by whom? A good tonsil, like any other good organ, should be left alone A diseased one should be completely removed Tonsillectomy is not a simple procedure Its performance requires the consummate skill of a man well trained in otolaryngology because only a complete removal of the diseased tonsil, leaving an absolutely clean throat, produces the desired results The number of secondary operations attest to this

---

Read before the Section on Laryngology Otology and Rhinology at the One Hundredth Annual Session of the American Medical Association Atlantic City June 14 1951

Closely associated with tonsillectomy is removal of the adenoids Adenoidectomy, usually considered a very simple procedure, is probably the most poorly done operative effort in all surgery because the area cannot be readily seen Infectious processes may have existed for years in this spongy lymphoid tissue, with a production of sinusitis, recurrent sore throats, and a surprising amount of toxemia In addition to good anesthesia, good light, good assistants, and good suction, instruments with which to elevate the palate and thoroughly remove the lymphoid tissue are required We should never underestimate the possibility of infection in the nasopharynx and its results It would be a good thing if each one in otolaryngology had to have his nose operated upon early in his career, to find out how sensitive the structures of the nose really are

A well-done submucous resection is one of the most satisfying operations because of the relief it gives the patient, for a nose blocked day and night is an extremely uncomfortable condition When deformity is present, in addition to the submucous resection, plastic procedures, not only to correct the deformity but also to improve the appearance and function of the nose, are included

Cases of chronic sinusitis, with or without polypoid change, have stimulated a great deal of study, to the end that conservative procedures have been sufficient to clear up many of these conditions However, when no good results have been obtained, we should never fail to resort to radical surgery This has been my routine practice, but my conviction was made indisputable by my own personal experience After a year at least of conservative effort, a right Caldwell-Luc operation with an exenteration of the right ethmoid and sphenoid gave complete results

There has been a tendency of late to treat the passing of endotracheal tubes, bronchoscopes, and esophagoscopes as simple, requiring little training and little care The otolaryngologist must be ever alert to the dangers of this practice There is no place in which good training and exacting care are more vital than in peroral endoscopy It is still a straight and rigid tube passed along soft tissues

The larger cysts and tumors of the mouth can be handled much more easily with intratracheal anesthesia To those who are more accustomed to working under these conditions rightfully belongs this surgery, especially of the large cysts arising from the cervical sinus Even under the most advantageous circumstances, these cysts are not easy to excise

The removal of teratological developments in the face, mouth, and neck are most interesting and frequently difficult surgical procedures These teratological developments have never elicited the proper interest of otolaryngologists in spite of the fact that their origin is in the throat, whence they travel far afield into the structures of the neck The removal of a thyroglossal cyst and tract demand careful dissection, especially if there are accessory tracts Experience has shown that removal of the central section of the hyoid bone at the time of the operation is essential Lateral cervical fistulas are best removed by the insertion of a filiform bougie and the use of stepladder incisions The fistula must be completely excised from its exit in the neck to the pharynx, just back of the tonsil The facial nerve has always been a prime interest of the otolaryngologist, therefore, the outlining of its distal branches with the removal of parotid tumors should be within his scope

With our aging population the care of the malignancies of the nose, throat, and larynx and their extensions into the surrounding tissues present another field for serious effort No one can tell as he attacks a malignant process in these tissues how far it has extended, and this extension, of course, must be removed along with the primary source of involvement

In spite of the use of chemotherapy and antibiotics, we still encounter some of the serious complications of the middle ear and mastoid diseases, such as brain abscess, acute thrombophlebitis of the lateral sinus, and labyrinthitis These conditions may become very serious because they are seldom expected We must never close our minds to their possibility!

There is no place in the body where reactions in the general system are shown better than in the membranes of the nose and throat. These reactions are evidenced by changes in the color, moisture, secretion, and sponginess of the membrane What the trigger mechanism is that produces these reactions is at times difficult to determine, but it must be sought by the physician in attendance A blocked nose is not always due to a deviated septum A wide open nose is not always due to the atrophic change associated with chronic infection The dry throat and hoarse voice are not always due to smoking or tumor of the vocal cord Nor is the sense of a lump in the throat always due to the thyroid adenoma, branchiogenic cyst, or cancer Medical otolaryngology has a very wide field into which enter allergic response, dietary deficiencies, blood dyscrasias, endocrine dysfunction, sympathetic and parasympathetic imbalance, and many other entirely medical problems It is true that we need the help of the internist, pediatrician, allergist, and specialists in other divisions of medicine, but no one can visualize the condition of the nose and throat tissue as well as we who are constantly surveying the area

In conclusion, this specialty is an important one in its own right Because of the complexities of the area covered by it, constant re-education in the embryology, physiology, anatomy, and pathology of the nose, throat, and ear as well as of the face, mouth, and neck is essential to good practice Otolaryngology offers a wide range for the surgeon, a broad field for those more interested in the medical side, and unlimited horizons for the general practitioner of otolaryngology—for our horizon is but the limit of our vision

1553 Woodward Ave

Therapy of Ménière's Disease.—A number of operations have been developed for alleviating the intractable vertigo of Ménière's disease in those patients in whom medical therapy either has failed or the institution of such a regimen was impractical The primary purpose of these procedures has been the prevention of the acute episodes of vertigo The available data tend to indicate that this is most consistently accomplished by resection of the eighth nerve and avulsion or electrocoagulation of the membranous horizontal semicircular canal.—Frank D Lathrop, M D, Surgery of Ménière's Disease, *The Surgical Clinics of North America,* June 1951

CLINICAL SIGNIFICANCE OF NIPPLE DISCHARGE

Edward F Lewison, M D
and
Robert G Chambers, M D , Baltimore

The significance of nipple discharge lies in the insignificance with which it is regarded Cancer detection requires an accurate appraisal and interpretation of the importance of nipple discharge in diseases of the breast

This review constitutes a statistical survey of 114 patients with nipple discharge who were operated on in the Johns Hopkins Hospital during the 10-yr period 1940-50 All patients were hospitalized, and the validity of the diagnoses was based upon pathologic evidence obtained in the operating room by the scalpel rather than by the random probing of an aspirating trocar The difficulties of our experience at the breast clinic have cautioned us against the peril of putting too much faith in the thin ice of diagnoses based on clinical impressions alone Thus, we have intentionally excluded from this study all patients who were classified as outpatients and who have never had their clinical diagnoses verified by microscopic examination Riddell[1] in his recent Hunterian lecture on carcinoma of the breast, stated that it is "wise to accept with humility that, however experienced we are, we cannot differentiate with certainty on clinical grounds alone between nonmalignant and early malignant" breast lesions

INCIDENCE

During the 10-yr period between 1940 and 1950 there were a total of 2,195 patients hospitalized at the Johns Hopkins Hospital for a great variety of diseases of the breast In the classified index of diagnoses these patients were found to be grouped in 48 different categories and subcategories of breast lesions in the files of the hospital record room Thus, from among 2,195 patients with breast disease there were 114 patients with nipple discharge—an incidence of 5 2% Included in this group were (1) patients whose primary complaint was discharge from the nipple and (2) patients whose nipple discharge was secondary to a menacing mammary disease or perhaps incidental to hospitalization for a primary disease unrelated to the breast but subsequently necessitating breast surgery At the time of initial examination, 74% of the patients had clinical evidence of breast disease determined by physical examination However, 26% of the patients had no physical sign other than discharge from the nipple Thus, no evidence of breast tumor could be detected in about one-fourth of the cases The duration of discharge in all patients ranged widely from three days to seven years

In a report by Hinchey[2] of all breast cases seen in the tumor clinics of the Massachusetts General Hospital and the Boston dispensary, 8 3% of 1 051 patients had nipple discharge Many of these were outpatients, and the diagnosis could be confirmed by microscopic examination in only 78% In a review of 2,269 cases of mammary lesions treated in the department of surgery at the State University of Iowa hospitals, Donnelly[3] found 9 6% to have discharge from the nipple There were in this series of patients 217 females and two males At the Johns Hopkins Hospital there was an almost identical ratio of 113 females and one male with nipple discharge The ratio of white to Negro patients was 64 to 50, but this may reflect merely the hospital bed capacity for the segregation of the races Also, it is well to consider that Baltimore has a white to Negro population ratio of about four to one

PHYSIOLOGY AND PATHOLOGY OF BENIGN BREAST DISEASE

Benign breast disease is a common but perplexing condition the cause of which is obscure, the pathology puzzling and the treatment empiric and unsatisfactory The medical literature is replete with many excellent papers, notably by Nelson,[4] Nathanson,[5] Atkins,[6] Taylor, and Haagensen,[8] which tend to interpret the pathology of benign breast disease on the basis of an abnormal physiology of the breast Since the mammary gland is often considered physiologically as a satellite of the female reproductive system, it would be expected, quite naturally, to respond to hormonal stimulation by the anterior pituitary, adrenals and gonads The hormonal relationship of the posterior pituitary, pancreas and thyroid to the breast is vague, but not entirely unlikely Nervous stimuli are also rather indefinitely involved in the uncertainties of breast physiology Actual morphologic changes in the breast, however, are known to be quite closely related to various phases of the reproductive cycle

It has been rather well established that the cyclic changes that normally occur within the breast can be correlated with the degree of estrogen and progesterone activity Mammary gland proliferation and branching of the ducts with little or no development of the alveolar system is known to be the result of estrogenic or ovarian follicular hormone stimulation Progesterone, in combination with estrogens, but not alone, induces extensive development of the breast to the compound acinar or alveolar stage Whether these changes are due solely to ovarian activity alone is still speculative Also, there is every reason to believe that variation in physiologic response may be in part due to the complex changes that

consist of epithelial proliferation, cyclic growth and regressive phases, vascular and secretory alterations, and changes in the water balance of the body due to endocrine influences Changes within the connective tissue or epithelial elements of the breast depend on the rise and fall in the number of hormones that originate principally in the gonads and to a lesser degree in the pituitary and adrenals This response to growth stimuli or abnormal involution following a normal response is the basis for understanding the pathologic changes of benign breast disease Yet one must bear in mind that there is a wide gradation of responsiveness to hormones that is present in both animals and man This is true not only of more than one breast, but also of different portions of the same breast Since the breast is not a static organ but rather a dynamic one dependent upon the action of hormones, Womack[9] has suggested that time is the fourth dimension to be considered in breast pathology—the reaction of certain target cells to certain stimuli acting over a certain period of time

For the purpose of this paper, benign breast disease will be divided arbitrarily into three major categories, namely, (1) chronic cystic mastitis, (2) fibroadenoma and (3) papilloma Although the term chronic cystic mastitis is a medical misnomer and catchall for a variety of painful and/or nodular lesions of the breast not due to neoplasia, inflammation, or necrosis, yet, in the matter of terminology "the chains of habit are generally too weak to be felt till they are too strong to be broken" The opinion of the profession is biased in favor of the term chronic cystic mastitis because it is accepted by all, advocated by authority, and recommended by custom The artillery of synonyms coined to describe the histological changes associated with chronic cystic mastitis are legion Fibrocystic disease, mastopathy, nodular hyperplasia, cyclomastopathy, Reclus' disease, Bloodgood's blue-domed cysts, Schimmelbusch's disease, mazoplasia, cystipherous epithelial hyperplasia, chronic mastitis, mammary dysplasia, mastodynia, adenosis, adenocystic disease and many other complex and hybrid names are often repeated in the literature, thus adding chronicity to the confusion

Fibroadenomas are among the most frequent tumors that occur in young women, and are particularly common in the Negro race They are characteristically firm and solid, may be round or lobulated, most often are freely movable and not attached to the skin or surrounding tissue and are infrequently the source of nipple discharge Microscopically, fibroadenomas reveal an increase in connective tissue stroma with a hypertrophy of ducts and ductal epithelium These tumors have been known to change in size and appearance during various phases of the menstrual cycle and most noticeably during pregnancy

Chronic cystic mastitis frequently occurs in women of middle life and is often associated with premenstrual breast pain and engorgement, tenderness to palpation, nodularity that may be deceptively firm, and, less frequently, discharge from the nipple There is often a proliferation and desquamation of the ductal epithelium with dilatation and the formation of cysts The interstitial connective tissue is increased, and there is noted an infiltration of small round cells Many variations and gradations of this pathologic process exist

Particular mention should be made of a type of chronic cystic mastitis specifically characterized by discharge from the nipple The secretion may be of any type and of any degree of viscosity Dilatation of the ducts adjacent to the nipple or beneath the areola can usually be palpated by careful examination Nathanson[5] suggests that this syndrome is probably due to an ovarian dysfunction resulting in incomplete involution caused by an anovulatory menstrual cycle

Papillomas are usually associated with varying degrees of epithelial hyperplasia within the duct system of the breast Duct cells proliferating in complex branching patterns are supported by a thin connective tissue and highly vascular core The location of these tumors and their fragile growth structure make them particularly vulnerable to damage and resulting hemorrhage The more marked papillomas may occur within a cyst, with or without a definite stalk deep within a duct in a breast lobule, or as a gross and readily felt papillary lesion in the subareolar region These palpable nodules are frequently multiple and may be detected by transillumination, careful manual examination and pressure tests, and by mammography Segmental stretching and point pressure around the areola will often result in exact localization of the source of serous or serosanguineous discharge from a papilloma Microscopic papillomas are frequently found universally distributed throughout the breast in the presence of gross disease Donnelly[3] notes that even with incomplete microscopic studies (the task of serial sectioning of breasts would be appalling) at least 20% of papillomas were multiple in character Our experience corroborates the fact that invariably if papillomas are carefully sought after they will be found to be multiple and extensive

TYPE OF NIPPLE DISCHARGE

The wide range of abnormal physiology of the breast gives scope for a great variability in the classification of nipple discharge It is doubtful if any two hospitals, any two surgeons, or any two series of cases could be precisely proportional Inasmuch as these proportions depend upon so many factors, it is indeed surprising that the several series reported are so closely comparable (Table 1)

The spectrum of secretion from the nipple can be of almost any color and description Separate ducts within the same nipple and at the very same time may secrete diverse types of discharge During the course of close clinical observation it is not uncommon to find a change in the character or color of the initial discharge from the nipple These shades of difference, however, may be representative of quite distinct and unrelated diseases of the breast To determine whether there was any constancy or correlation between the type of nipple discharge and a specific lesion of the breast, our figures were analyzed in Table 2 Except perhaps for papilloma there would appear to be only a haphazard relationship between the type of nipple discharge encountered and the underlying mastopathy All cases of papilloma with nipple discharge showed the presence of either a serosanguineous or a serous secretion Cancer and benign breast disease (a lumping category mentioned previously) are quite similar in the types of nipple discharge noted Thus, it would appear clearly evident that no one type of nipple discharge is specific for a particular breast lesion, and conversely, both cancer and benign breast disease can give rise to diverse types of nipple discharge Therefore, these alien signs are disappointing from the point of view of differential diagnosis

[9] Womack, N A Benign Lesions of the Breast J Kansas M Soc (Cancer Suppl) 50 64 1949

Since the Papanicolaou smear technique has become a part of the laboratory routine of most hospitals, there have been several studies indicating its usefulness as applied to breast secretions Material for examination is usually obtained either by direct smearing of secretions or by trocar aspiration of a suspicious area in the breast From our very limited experience with this technique its value as a diagnostic aid will require further evidence

Gray and Wood [10] noted, in their study of both benign and malignant papilloma of the breast, that a discharge from the nipple occurred in 77% of their 227 cases In all of their papilloma cases, as in all of our cases, the secretion was serous or serosanguineous In discussing the significance of a serohemorrhagic or hemorrhagic discharge from the nipple, Adair,[11] Judd,[12] and Miller and Lewis [13] found about the same proportion of benign and malignant lesions responsible for the abnormal discharge In studying a group of cases of benign breast disease (fibrocystic disease and papilloma) Mingazzini [14] found that a sanguineous discharge was the first sign of disease in a majority of cases In one case, discharge from the nipple preceded the development of a tumor by 10 yr and in another case, by six years

Among the types of nipple discharge found less commonly one notes the occasional occurrence of a whitish or milky secretion This white discharge from the nipple may be milk, pus or carcinoma cells A cytological examination of the secretion should insure a reliable and ready differentiation Cheatle and Cutler [15] reported one example of a thick white discharge that consisted of carcinoma cells from a subareolar duct cancer

Among the miscellaneous types of nipple discharge, one may find a thick greenish discharge from the nipple This is usually the result of retained secretions following lactation, which stagnate within dilated ducts As suggested by Geschickter [16] this inspissated or grumous discharge may become contaminated with Bacillus pyocyaneous, an infection accounting for its garish green color Others believe that it may be due to disintegrating blood pigment In an interesting study by Stajano,[1] of Montevideo many different types of abnormal secretions of the breast were discussed He called particular attention to a relatively infrequent type of gray or black secretion that is of practical importance because it may closely simulate and be mistaken for a sanguineous nipple secretion Many phagocytic cells of the reticuloendothelial system filled with particles of melanin were present in the secretion of the patients he observed

ETIOLOGY OF NIPPLE DISCHARGE

The careful observations of many investigators have shown that most cases of nipple discharge are caused by (1) chronic cystic mastitis and fibroadenoma, (2) papilloma, and (3) cancer Donnelly [3] notes that chronic mastitis was responsible for 25% (55 cases) of nipple discharge in his series, intraductal papilloma was responsible for 30% (66 cases), and cancer, including Paget's disease, was responsible for the remaining 45% (98 cases) Hinchey [2] found that proliferative cystic disease and hormonal dysfunction caused 54% (36 cases), intraductal papilloma 10 5% (7 cases), and cancer, including Paget's disease, 36% (24 cases) of discharge from the nipple In limiting this study to the bleeding nipple alone Campbell [18] recorded the following sources of discharge cystic disease 24% (13 cases), papillomas 36% (19 cases), and cancer 38% (21 cases) Arthur Purdy Stout,[19] a surgical pathologist particularly skilled in the pathology and nosology of breast lesions, finds the foregoing facts and figures refutable He is "astonished to find that there are still physicians who believe that in more than half of the women showing this sign (bleeding from the nipple), the cause is cancer This is, of course, entirely contrary to the facts "

60% of the cases of nipple discharge, and malignant lesions, about 40% In the present group of Johns Hopkins Hospital cases (Table 3) benign lesions of the breast were the source of almost 80% of the cases of nipple discharge, whereas malignant lesions were the source of only 20% of these cases It is not an altogether surprising measure of merit to find a high index of suspicion associated with a low incidence of cancer among the patients with breast disease who reach the operating room For no case is as early as it seems and "We must grow more and more accustomed to suspecting malignant disease on less and less clinical evidence "[1]

Careful examination of Table 3 confirms the impression that many diseases of the breast may be the source of secretion from the nipple In addition to the causes listed in Table 3 Adair[11] noted that seven out of 10 patients with plasma cell mastitis had a nipple discharge Specific and nonspecific ductal diseases are often associated with nipple discharge An endocrine factor has been suggested as the etiological basis for some cases, although most investigators have been unable to confirm this by means of the urinary hormone assays available at present The measurement of steroid biologic waste products in the urine is often a routine ritual responsible for one's bewildering oneself scientifically Perhaps the key to the problem of effective hormone estimation should be sought in efficient methods of blood level determinations rather than in urinary assays Whether new and more precise yardsticks and blood tests will confirm this point of view remains to be seen In our group of 114 cases 7% (8 cases) gave quasi-clinical or laboratory evidence of hormone imbalance A whitish discharge was present in two, and a serous discharge was present in six, of these cases Gynecomastia in a young male was the source of a milky discharge in one of the above cases Trauma was associated with nipple discharge in only 4 4% (5 cases)

TREATMENT

A review of the surgical press reveals a disconcerting lack of uniformity in the treatment of patients with discharge from the nipple Although the subject has prompted a free and diverse discussion in the contemporary as well as in the time-honored annals of medical literature, the significance and therapy of nipple discharge remains independently in keeping with the custom of each individual surgeon In the etiology and pathology of underlying breast disease, our clinical experience is long but our basic knowledge is short This serves variably as a beacon to some and a scarecrow to others It is unfortunate but true that observational pathology has been unable to pigeonhole all breast diseases into error-tight compartments of benign and malignant lesions Thus, the deliberation and decisions required in treatment of patients with nipple discharge are too often based on ill-defined and intangible clinical judgment

Bloodgood,[20] a renowned authority of great influence in the evaluation of diseases of the breast, was strongly prejudiced regarding the lack of significance of discharge from the nipple as a diagnostic sign From among his voluminous contributions one may quote the following

> Discharge from the nipple, like pain, is not an indication of a lesion of the breast for which operation is indicated There is no evidence that these lesions are precancerous, and the prevailing view that a woman with a discharge from the nipple should be protected from cancer by the removal of the breast is based on fear and not on fact

The conservative convictions of Campbell[18] indicate that "too much fear, even panic, has been exhibited toward the symptom of bloody discharge from the nipple " In accord with Campbell are Slaughter and Peterson[21] who believe that "the diagnosis of 'chronic cystic mastitis,' the presence of a bleeding nipple, or of intraductal papillomas without cellular atypism, do not indicate a prophylactic simple amputation, especially in young women " In a small series of patients with bleeding from the nipple but without a palpable tumor, Saltzstein and Pollack were not impressed by the potentially malignant nature of the condition Local excision in preference to "prophylactic" simple mastectomy was performed in six of the seven patients operated on Follow-up studies, however, are not recorded Geschickter,[10] a disciple of Bloodgood, reviews the pros and cons of nipple discharge as a sign of mammary lesions and concludes "proper investigation of the symptom is of the utmost importance " Gray and Wood[10] of the Mayo Clinic present the results of their clinical and pathologic study and "emphasize particularly the fact that discharge from the nipple, of any nature whatsoever, was found to be of great significance " To those who seek comfort in hope rather than in experience Gray and Wood offer the warning "that in 48% of our series of patients with malignant papillomas no tumor was demonstrable No tumors were palpable in 60% of all patients with malignant papillomas who had experienced discharge from the nipple " In general, Donnelly [3] favored more active surgical treatment for patients with nipple discharge

---

[20] Bloodgood J C Benign Lesions of Female Breast for Which Operation Is Not Indicated J A M A. 78:859 (March 25) 1922.

[21] Slaughter D P and Peterson, L. W Indications for Simple Mastectomy Surg Gynec & Obst 85 456 1947

> Of the 219 patients treated at this hospital, 36 or 17 per cent did not have a palpable mass when examined All but one of these patients were operated upon, and the type of lesions found on histologic examination are of definite interest, in that thirty of the lesions showed definite evidence of hyperplasia Five patients had malignant lesions Six patients had lesions showing definite precancerous change

In the present series of 114 patients with nipple discharge Table 4 indicates that there was a variable standard of surgical treatment Most patients who were considered to have chronic cystic mastitis on the basis of frozen section were treated conservatively by a simple local excision When the lesion was widespread with diffuse nodularity or when there were marked hyperplastic changes, with or without the presence of a distinct tumor, simple mastectomy was the treatment of choice In two patients radical mastectomy was performed because the frozen section was reported to be carcinomatous, permanent sections failed to confirm this diagnosis Most patients with fibroadenoma were treated by local excision The treatment of papillomas was distinctive and individualized for each particular patient Whenever the histological changes were multiple and showed evidence of diffuse hyperplasia, simple mastectomy was favored in preference to local surgery

Paget's disease is a breast cancer arising in the epidermoid structures of the nipple and areola Although radical mastectomy is the treatment of choice, it was performed in only four out of nine patients One patient steadfastly refused to have any type of operative procedure beyond a local excision All other patients with breast cancer were treated by radical mastectomy

COMMENT

Nipple discharge is a sign of abnormality within the breast. Despite the difficulties of differential diagnosis presented by this sign, it can be assumed that secretion from the nipple betrays an early and unsuspected ductal or ductal-acinar disease If one could be certain that the relationship between benign breast disease and cancer is merely one of chance association rather than of elusive cause and effect, one could perhaps strongly defend endocrine therapy as the treatment of choice in restoring an abnormal breast physiology However, in the present series there were 22 cases of cancer of the breast with discharge from the nipple In 14 (64%) of these cases there was an associated history of benign breast disease There is an imperative need for a more careful analysis and evaluation of the relationship between benign breast disease and cancer The argument for this type of study lies in the weakness of our present methods of treatment.

No attempt at a long-term follow-up could be made in this short-range investigation However, in our study there were 63 patients with benign breast disease who were followed up for varying periods of time from one to 10 yr Regardless of the surgical procedure performed, breast cancer did not develop in any of these patients during their brief period of follow-up observation It would be of great importance to know whether these patients with manifest benign breast disease can look forward to a future free of danger

Of 104 patients with chronic cystic mastitis Donnelly [3] was able to obtain a postoperative follow-up study on 61 It is significant to note that those patients who subsequently had difficulty were those treated by local excision Among others with precancerous lesions six patients treated conservatively by means of simple excision alone ultimately developed cancer Every example of a recurrent malignancy in patients receiving inadequate surgery strengthens the argument for ample exploratory operations on the breast

SUMMARY AND CONCLUSIONS

This study constitutes a report on 114 patients with nipple discharge The incidence of this clinical sign in 2,195 patients with variegated breast disease was 5 2%

Benign breast disease, which includes chronic cystic mastitis, fibroadenoma and papilloma, was the source of about 80% of the cases of nipple discharge, whereas malignant breast disease, which includes Paget's disease was the source of 20% of the cases No sign of a palpable breast tumor could be found in 26% of either benign or malignant cases

The evidence indicates that no one type of nipple discharge is specific for a particular type of breast lesion, and conversely, cancer as well as benign breast disease can give rise to diverse types of nipple discharge However, in all cases of papilloma there was either a serous or a serosanguineous secretion from the nipple

Indications for surgical treatment are suggested The onus of responsibility rests heavily upon those who pursue the policy of watchful waiting

"We must grow more and more accustomed to suspecting malignant disease on less and less clinical evidence " [1] Thus, the virtue of nipple discharge as a diagnostic sign in foresight may be irretrievably lost in hindsight

1020 St Paul Street

Polycystic Renal Disease.—The disease may be almost silent the symptoms causing the individual to seek medical aid being those of a medical nature and pointing to chronic uremic or hypertensive states The complaints may be of loss of weight, digestive disturbances, dizziness, headaches, malaise, or edema In some instances, an abdominal mass may have been noted by the person himself with no other difficulty being experienced More frequently, there will be complaints of pain, or a history of hematuria with or without pain, and recurrent febrile episodes with or without urinary symptoms The pain may be a dull, chronic, ill defined lumbar ache In many instances, there are superimposed recurrent attacks of sharp pain, typical of renal colic It has been theorized that the dull nagging pain may be due to traction on the renal pedicle by the enlarged heavy kidney The sudden sharp colicky pain may be due to sudden overdistention or rupture of the cysts by hemorrhage into the lumen If there is gross hematuria with passage of clots, these may cause typical ureteral colic The hematuria may be recurrent and painless or with colic as noted In some instances the hemorrhage may be so severe and persistent that surgical measures, even nephrectomy, may be required for its control —Frank N Buck R Carl Bunts, and Austin I Dodson Preservation of Renal Function in Polycystic Disease, *The Journal of Urology*, July 1951

The following case history, of a patient who was so ill that postoperative complications, or even death, might have been expected, illustrates our aggressive approach in the use of early ambulation

Illustrative Case.—A woman aged 53, had been ill for four days with midabdominal pain and cramps There had been no vomiting and no evacuation of the bowels On admission, since she was semicomatose and incoherent because of toxemia, it was impossible to obtain an adequate history from her Her temperature on admission was 101 F and the pulse rate was 140

Physical examination revealed no abnormalities except dehydration, abdominal distention, Grade III, and generalized tenderness, severer in the lower abdomen and extreme in the pelvis on bimanual vaginal examination The clinical impression was ruptured pelvic appendix, gangrenous intestines, or twisted pedicle of the ovary

After proper preparation, a lower midline incision revealed about 6 oz (180 gm) of free pus in the pelvis from a large rupture of a gangrenous appendix, this was not walled off The pus was aspirated and the appendix removed, and the abdomen was closed without a drain After the operation, the patient remained in a semicomatose state and had to be restrained for about 10 days Antibiotics were employed to the limit of tolerance, and fluids were administered parenterally The temperature and pulse varied between 101 and 103 F, and 110 and 150 respectively

On the day of operation, the patient walked with support, four times The next five days she walked a distance of about 200 ft (about 609 m) in the hall four times each day Though this patient was semicomatose and confused, she could walk considerable distances with the aid of two nurses who were well trained in the ambulatory procedure After the sixth day, weakness limited ambulation to about 50 ft (about 152 m) four times each day No food was tolerated until the 16th day, after which the walking distance was again increased The first bowel evacuation also occurred on the 16th day No enemas were given

By the 18th day the patient was so much improved that she was able to walk increasing distances alone She left the hospital completely recovered, on the 27th postoperative day

2 During the rest period in bed, leg exercises, as already described, are directed by means of an exercise chart, which is kept in constant view of the patient These exercises are performed every 10 or 15 min and it is the duty of the attending nurse to check frequently to see that they are being done properly We feel that these exercises are extremely important, particularly on the day of operation, as an adjuvant in the prevention of loose clot formation in the deep veins of the legs

3 During the first stages after operation, the patient is not permitted to sit in a chair The patient walks as much as possible and then returns to bed Until ambulation is well established and the patient is almost normally active, the patient is not allowed to sit in a chair, except for very short periods while eating a meal or while the bed is being changed In patients who have been subjected to extensive surgical procedures, this may require several days Even when the patient is allowed to sit in a chair, this should not be done for long periods The bed is kept flat at all times, back rests are not permitted, and patients are never allowed to have pillows placed under their knees We believe that the common practice of permitting patients to sit in a chair instead of walking during the early postoperative period accounts for some of the unfavorable reports

4 During the first period out of bed, the patient is required to cough while the nurse checks for the presence of palpable rales If rales are present, and the amount of mucus is large, vigorous voluntary coughing is required until the mucus is entirely expelled Excessive mucus and palpable rales can be and always should be eliminated by this means If there should be any threat of atelectasis, coughing exercises, in the standing position, are performed every two hours or oftener to obviate this danger The patient must be encouraged to cough vigorously, for the more effort expended by the patient, the greater the benefit

5 Only rarely is a narcotic given until after the patient has been out of bed to walk for the first time Sedatives are employed sparingly throughout the postoperative period In many cases they are not necessary at all Antibiotics are employed prophylactically when indicated

6 Electrolyte and water balance is carefully maintained during the preoperative and postoperative periods

7 Many patients are permitted a full diet immediately after operation, usually regulated by the patient's appetite Cathartics or enemas are not given postoperatively, they are considered dangerous in many instances The need for use of a bedpan is extremely rare, since patients walk to the bathroom from the beginning

8 There is no danger of wound disruption from ambulation if proper incisions and proper suture technique are used [22]

9 It is important that, before operation, patients should be ambulatory If, for some extraordinary reason, this is impossible, leg exercises in bed—vigorous flexion and extension of the toes, ankles, and knees at least four times every hour— should be substituted The regimen used after surgery is merely physiological management, and it is a mistake to call it rehabilitation If the patient's condition is such that he needs rehabilitation, it is done before operation excepting in the most acute emergency

When the preoperative and postoperative care of surgical patients is carried out with aggressive insistence in this manner, our experience furnishes convincing evidence that the hazards of prolonged disability or loss of life from embolic complications should be practically eliminated

THROMBOPHLEBITIS

In a series of 3,371 surgical cases, 90% of which were abdominal operations, and at least 1,631 represented so-called major surgery entailing greater hazard of embolic complication, there was no instance of pulmonary embolism either fatal or nonfatal (Table) The series does not include five cases of thrombophlebitis, the management of which deserves comment

Two of the cases of thrombophlebitis occurred early in the series and have been previously reported [illegible] Three additional instances have been observed during the past five years One of these patients was a man who left the hospital two days after a right herniorrhaphy, completely ambulatory On the fifth day after operation, some pain and slight swelling of the right leg appeared An elastic bandage was applied at the time and the patient remained ambulatory, returning to our office every few days for observation The condition improved steadily, and at the end of three weeks all pain and swelling had completely disappeared and the patient has remained entirely well The second patient was a woman with pelvic inflammatory disease with multiple chronic abscesses (frozen pelvis) She was ambulatory immediately after recovery from the anesthetic, and left the hospital on the fifth day after operation On the 18th postoperative day, there was a slight swelling of the left calf and some pain on walking A bandage was applied and normal ambulation was continued, with the patient coming to the office for observation at frequent intervals The pain disappeared in about 10 days, and after three months there was no residual swelling A woman who had an abdominoperineal resection had some swelling, with no significant pain, of the left leg five days after operation A bandage was applied and vigorous activity was continued When the patient came to the office 10 days later, the swelling of the leg had completely disappeared and she has had no further difficulty

Early ambulation cannot eliminate the possibility of phlebitis (inflammation), but will prevent the development of a large, loosely attached clot by greatly increasing the velocity of the blood stream Loose clots are thus washed away when they are incipient and still in the sludge state We have not in the 12 years during which early ambulation has been practiced, seen a single patient with fatal or nonfatal pulmonary embolism Venous ligation has never been used and no patient has ever received medical treatment with anticoagulants

COMMENT

The rationale of early ambulation and frequent leg exercise has previously been described,[23] and has also been emphasized by others It has been established that blood sludge, minute sticky clumps of red cells, are present after every surgical procedure [24] owing to the increased coagulability of the blood, and that the recumbent position results in mechanical stagnation of the venous flow [25] Hence it follows that vigorous flexion and extension of the toes, ankles and knees (in-bed exercises), and frequent walking in as brisk a manner as possible will quicken the circulation in the veins and keep the sticky sludge moving Thus, any loosely attached minute thrombus will be dislodged before the formation of a clot of sufficient size to cause fatal pulmonary embolism

In discussing early ambulation with many surgeons, in visiting university and private hospitals, and in reviewing published reports, it is evident that almost none of them approach the problem in the aggressive and standardized way that has proved efficacious in preventing thrombo-embolism in our patients Therefore, it seems to us that until those who still doubt the prophylactic value of early ambulation have applied it with this determined attitude and careful regimen in a large series of cases, this procedure, which is universally applicable in practically all surgical cases, should not be discredited by less favorable results reported by those who have used it half-heartedly and timidly, and without a completely standardized technique

A standardized regimen embracing an aggressive attitude toward early ambulation and specific leg exercises has solved the problem of embolic complications after surgery for us Those who profess to use early ambulation and yet continue to report cases of fatal pulmonary embolism caused by postoperative development of a thrombus in the deep veins of the leg should reexamine and reevaluate their technique of postoperative care

Zoonoses —There are over 80 known diseases which can be transmitted to man by vertebrate animals One need only cite tuberculosis, brucellosis, rabies, Q fever, and anthrax to give an idea of the importance of some of these diseases Requests for technical advice received by WHO and by the United Nations Food and Agricultural Organization (FAO) led to the setting up of a Joint WHO/FAO Expert Group on Zoonoses, which held its first session in Geneva from Dec 11-16, 1950 The report on this meeting has recently been published as World Health Organization Technical Report Series, No 40 During this session the group dealt with the question of whether to formulate international sanitary regulations to reduce the risk of spreading zoonoses Is it possible to establish sanitary regulations to prevent the spread of the zoonoses, similar to the regulations dealing with contagious diseases in man? The group discussed this question, and it became evident that it would be difficult to frame regulations acceptable to all countries for, while certain countries might be ready to impose the most stringent regulations, others would be unable to do so for economic reasons or because they are obliged to import livestock Nevertheless, the problem is worthy of further consideration. —Diseases Transmitted to Man by Animals, *Chronicle of the World Health Organization* May, 1951

PATHOGENESIS OF LIVER CIRRHOSIS IN SCHISTOSOMIASIS

Douglas Symmers, M D , New York

One of the most important of parasitic diseases is caused by the blood fluke, Schistosoma haematobium The disease is prevalent in North and South Africa, especially in Egypt, but also in the Sudan, Ethiopia, the Congo, and Rhodesia, as well as in Arabia, Persia, the west coast of India, Madagascar, Puerto Rico, and occasionally in Australia and the United States Cirrhosis of the liver is among the disabilities which are caused by or are associated with the presence of this parasite In Egypt there is a variety of cirrhosis which is attended by the presence of the ova of Bilharzia The lesion is characterized by enormous thickening of the periportal connective tissue and is sometimes called pipe stem cirrhosis In China and Japan and in the Philippines there is a disease known as Asiatic schistosomiasis, which is characterized by cirrhosis of the liver, splenomegaly, ascites, dysentery, progressive anemia, and sometimes focalized epilepsy The disease occurs extensively in one district of Japan, where it is designated "Katayama" disease It seems that Asiatic schistosomiasis, or, as it is otherwise known, urticarial fever, is not uncommon in these countries and is associated with the presence of parasites in the vessels of the alimentary canal and elsewhere and with eosinophilia, urticaria, and fever Cirrhosis of the liver together with its attendant ascites is usually a late manifestation, occurring from three to five years after infestation Another form of parasitic liver disease is attended by the deposition of schistosome eggs in the liver, the ova acting as foreign bodies which give rise to focal granulomas associated with the formation of multinuclear giant cells of the Langhans type Until the year 1926 Cutler [1] was able to collect reports of only 22 cases of schistosomiasis occurring in the United States and Canada However, that the incidence of the disease is apparently increasing in North America is indicated by the fact that since 1933 five cases have been subjected to necropsy at Bellevue Hospital alone

REPORT OF CASES

CASE 1 —E L , aged 45, a native of the French West Indies was admitted to Bellevue Hospital because of swelling of the legs and abdomen The patient stated that he consumed 5 or 6 oz (150 or 180 cc) of rum daily On admission, examination revealed physical signs of ascites, dilated superficial abdominal veins, and edema of the legs Death occurred Dec 31, 1933

Necropsy —The body was that of a poorly nourished adult white man weighing approximately 145 lb (65 8 kg) When the abdomen was opened, 500 cc of serosanguemeous fluid was removed The liver was greatly diminished in size, and the surface was diffusely nodular, the individual nodules measuring from 2 to 5 mm On section the organ cut with resistance and presented a granular appearance The liver weighed 1 500 gm Microscopically, the substance of the organ was divided into islands of variable sizes by overgrowth of connective tissue In a branch of the portal vein near the porta hepatis there was an area of fibrosis in which schistosome ova were present Another part of the same vein contained a solitary granuloma consisting of lymphocytes and eosinophils together with a giant cell which enclosed a well preserved ovum Near the walls of one of the larger intrahepatic branches of the portal vein were half a dozen schistosome ova lying in a matrix of lymphocytes, eosinophils, and an occasional polymorphonuclear neutrophil The spleen was absent, having been removed at operation On removal the organ measured 22 5 by 10 by 7 cm Microscopic examination showed diffuse dilatation of the sinuses hyperplastic lymph follicles, and irregularly scattered areas of fibrosis, hyalinization, and calcification in the walls of the central arteries No ova were detected The rest of the organs showed nothing of interest in the present connection

CASE 2 —A 38 yr -old Puerto Rican was admitted to Bellevue Hospital with the symptoms and signs of gastric ulcer and died Dec 24, 1948 as a result of profuse hematemesis

Necropsy —The body was that of a poorly nourished man On section the abdominal cavity was seen to be filled with blood clot After the clot was removed, the lower edge of the liver was found to extend 8 cm below the right costal margin On removal the organ weighed 2,200 gm It was greenish yellow, firm, and diffusely nodular The rest of the organs showed nothing of interest in the present connection Microscopic examination of sections removed from seven different parts of the liver showed in all of them widespread overgrowth of the perilobular connective tissue In one of the sections there was a solitary, small, circumscribed granuloma lying among the parenchyma cells It consisted practically exclusively of eosinophils arranged around a hyalinized schistosome ovum

CASE 3 —A 21-yr -old Puerto Rican woman was admitted to Bellevue Hospital complaining of shortness of breath and swelling of the legs On admission she presented the signs of an enlarged heart, with mitral insufficiency and mitral stenosis, together with swelling of the legs and abdomen and extreme dyspnea [2] At necropsy the liver was small, weighing 960 gm The consistency was increased, and the cut surface revealed numerous irregularly outlined dark red areas Microscopically, the structural unit consisted of a central vein surrounded by compressed liver cells, between which were collections of densely packed and partially autolyzed erythrocytes In addition, there were patchlike areas of interlobular fibrosis Many small granulomas were present in various parts of the liver and consisted of lymphocytes, eosinophils, and plasma cells arranged around the ova of schistosomes with or without the presence of multinuclear giant cells Microscopically, schistosome granulomas were also found in the pancreas, the cortex of the kidney, the myocardium, and the lung

CASE 4 —A 24-yr -old Puerto Rican woman died in Bellevue Hospital on April 30, 1950 There was nothing in the clinical history worthy of note in the present connection, except, perhaps, that death apparently was due to extensive thoracic and abdominal lymph node tuberculosis

Necropsy —The body was that of a fairly well nourished woman, weighing about 130 lb (59 0 kg) When the abdomen was opened, the liver was found greatly enlarged, the lower edge lying 10 cm below the costal margin in the right midclavicular line On removal the organ weighed 2,250 gm The capsule was smooth and glistening, the substance yellowish, and the lobular pattern was well preserved The thoracic and para aortic retroperitoneal lymph nodes were markedly enlarged and, on section, were almost completely caseous The rest of the organs showed nothing of interest in the present connection Microscopically, the lymph nodes showed epithelioid tubercles with extensive conglomerate areas of coagulation necrosis In the liver parenchyma were a few small, rounded granulomas composed of eosinophils, lymphocytes, and an occasional polymorphonuclear neutrophil, among which were multinuclear giant cells arranged around schistosome ova in various stages of disintegration Granulomas of similar or identical structure

were found in the mucosa and immediately adjacent submucosa of the colon, in the lungs, and in the interstitial tissues of the pancreas

Case 5—A 30-yr-old Puerto Rican man on admission to Bellevue Hospital revealed signs of pulmonary tuberculosis with cavitation Otherwise the clinical history contained nothing of interest in the present connection

Necropsy—The body was that of a well developed, moderately well nourished man Examination of the various organs showed nothing of interest, with the possible exception of the liver, which weighed 1,500 gm and, on both inspection and section, appeared to be normal Microscopic examination of sections removed from three different parts of the liver showed in one of them a small solitary, circumscribed granuloma lying among the parenchymal cells near the surface The granuloma consisted of a preponderance of lymphocytes surrounding a hyalinized, twisted and distorted schistosome ovum Except for scattered foci of fat vacuoles, the rest of the liver was well preserved

SUMMARY AND CONCLUSIONS

In two of the five cases synopsized, cirrhosis of the liver was present and was attended by focal schistosomal granulomas lying in the walls of blood vessels or among the parenchymal cells, while cirrhotic changes occupied the perilobular spaces and arose independently of parasitic granulomas In a third case the liver was the seat of chronic passive congestion, together with patchlike areas of interlobular fibrosis Scattered throughout were numerous small granulomas consisting of variable numbers of eosinophils, lymphocytes, and plasma cells, with or without multinuclear giant cells arranged around the ova of schistosomes In the remaining two cases the changes in the liver were limited practically exclusively to the presence of occasional parenchymal granulomas formed around schistosome ova It is scarcely conceivable that relatively innocuous foreign bodies such as ova, acting alone, are capable of causing perilobular cirrhosis of the liver but that, when cirrhosis of the liver is associated with parasitic disease, such as schistosomiasis, the cirrhotic changes are to be attributed, most likely, to the miserable dietary conditions under which these patients live

COMPLICATIONS AND SURGICAL TREATMENT OF HIATUS HERNIA AND SHORT ESOPHAGUS WITH THORACIC STOMACH

Donald B Effler, M D
and
E N Collins, M D, Cleveland

In 1933, Akerlund [1] offered a simple classification of esophageal hiatus hernias The three basic types are (1) short esophagus with thoracic stomach, (2) normal esophagus with paraesophageal hernia, (3) normal esophagus with pulsion type hernia

Harrington's [2] excellent reports on the embryology, anatomy, and therapy of the various hiatal hernias have stimulated interest in their clinical recognition The erroneous concept that hiatus hernia is a benign, structural curiosity incapable of serious portent is rapidly declining

The least common of the hiatal hernias is that type associated with true short esophagus Certainly it is less commonly recognized by the clinician and the roentgenologist than are the more obvious paraesophageal hernias Endoscopists have called attention to short esophagus for years and, for the most part, have inherited the management of the disease With the general lack of interest and failure in recognition, there has been associated unawareness of the serious possibilities of acquired short esophagus Likewise, the development of satisfactory therapy has not kept pace with that of the commoner lesions observed elsewhere in the gastrointestinal tract

COMPLICATIONS OF SHORT ESOPHAGUS

Careful distinction must be made between symptoms and complications in evaluation of the extent of the disease process and its response to conservative therapy The majority of patients with acquired short esophagus have symptoms of dyspepsia, esophageal pain, dysphagia, nocturnal distress, and retrosternal discomfort The development of peptic ulcer or severe anemia is indicative of major complication and is not a part of the true symptom complex

The complications of acquired short esophagus and its associated thoracic stomach (Fig 1) may be classified simply in three categories

1 Bleeding—Massive or Occult
    a Hematemesis
    b Melena
2 Peptic Ulcer
    a With bleeding
    b With perforation
3 Stricture

Bleeding—This appears to be the commonest complication of symptomatic short esophagus In our experience the bleeding is usually occult The patient may be entirely unaware of the significance of black stools, attributing this occurence to diet or medications In five of our cases, the hemoglobin level has been below 7 0 gm, without the patient's comprehension of blood loss

Periodic, severe hematemesis does occur During 1950, we saw three patients who required emergency

hospital admission because of hematemesis attributed to short esophagus Each patient required multiple transfusions to reestablish and maintain blood volume The frequency of hematemesis in patients with short esophagus has been commented on by Olsen,[3] Harrington,[2a] and Allison [4] Certainly the incidence is sufficiently common to warrant consideration in any case in which there is unexplained vomiting of blood

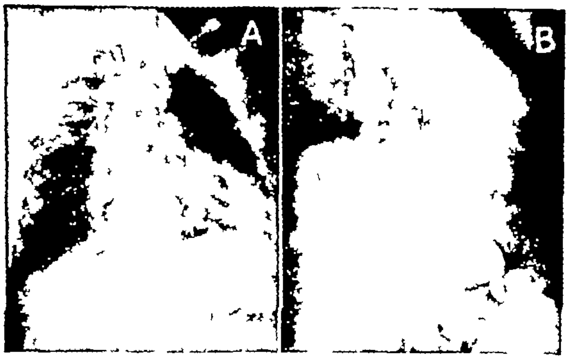

Fig 1—*A* roentgenogram illustrating true short esophagus associated with large thoracic stomach in a woman 60 The primary symptoms associated with this lesion were dyspepsia melena and severe secondary anemia *B* roentgenogram showing short esophagus in a man 61 with history of intractable dyspepsia over an 18 year period

Peptic Ulcer—The association of ulceration with acquired short esophagus has been recognized for many years In 1943, Allison [4] presented 10 cases of short esophagus with peptic ulceration The diagnoses were based on clinical, roentgenologic, and esophagoscopic findings Land [5] and Allison commented on the severity of the symptoms and the resistance to conservative therapy American writers [6] as well have emphasized the association of peptic ulceration in short esophagus

There seems to be little question that peptic ulcer may occur as either the initiating factor or as a secondary complication of short esophagus When ulcer is present, there is an associated esophagitis and gastritis, which greatly impedes accurate localization In the few patients on whom we have operated for intractable pain, bleeding, and dysphagia, the ulcer always has been in the thoracic stomach (Fig 2), we have not seen true peptic ulcer within the esophagus at operation In three cases the ulcer had perforated into the mediastinum, the sealed perforation involved the pericardium in one instance and the right lower lobe of the lung in another

Stricture—Dysphagia is the commonest symptom of short esophagus Whereas dysphagia may be transient in nature and due to neurogenic cardiospasm, an organic stricture is the result of a severe inflammatory process such as long-standing esophagitis *The stricture is due to a cicatrizing contracture at the cardiac end of the esophagus* Occasionally a fibrous stricture may be found in short esophagus associated with scleroderma, apparently esophagitis is not a factor in this instance

With development of stricture, there may be associated progressive shortening The degree of "esophageal insufficiency" is not fixed necessarily When the disease is acquired, the shortening is believed to be a reflex phenomenon with associated inflammatory and neurogenic factors If the entity is unrecognized or its treatment inadequate, the shortening may be progressive In severe cases, the esophagus may contract to approximately one-half of its expected normal length The opportunity for a clinical cure may be lost if the disease progresses to the ultimate degree

THERAPY

The management of short esophagus has been handled primarily by the endoscopist and gastroenterologist. Detailed programs of therapy have been offered by Olsen,[3] Polley,[7] Dick and Hurst,[8] Allison and associates,[4] and others Elaboration of the measures described is not relevant at this time, in general, two methods of conservative therapy have been suggested (1) dietary control with supplemental medication and (2) use of bougies for the relief of stricture

In their excellent review of the pathology and therapy of short esophagus with complication, Allison and his co-workers,[4] state they are not convinced that any form of treatment offers cure We are in accord with this statement Careful medical therapy and periodic use of bougies often will alleviate the symptoms of short esophagus but cannot cure the structural abnormality It seems logical, however, that the ideal therapy would involve *restoration of the esophagus to normal length and reduction of the stomach to the abdominal cavity* Unless this is accomplished, any therapy, *regardless of its intensity, must be considered as palliative only*

In evaluating the site of surgery for short esophagus one must distinguish between the uncomplicated and complicated types This statement may be amplified by a brief description of the methods of surgical treatment employed at the Cleveland Clinic

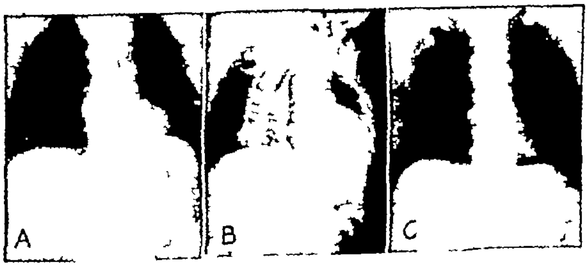

Fig 2—Examples of severely complicated short esophagus associated with peptic ulcer *A* perforating ulcer of thoracic stomach with direct extension into parietal pericardium *B* severe stricture with peptic ulcer of thoracic stomach perforating into lower lobe of right lung. *C* short esophagus with penetrating peptic ulcer in thoracic stomach associated with intractable pain

SURGICAL TREATMENT

Complicated Short Esophagus—When short esophagus is associated with peptic ulcer, stricture, and severe anemia, evaluation of the primary disease is difficult Prolonged hospitalization and intensive medical therapy *have yielded poor results too frequently* Also it may be impossible to exclude carcinoma by roentgen studies of esophagoscopy The generally unsatisfactory responses in our experience, plus the uncertainty of diagnosis, have prompted a radical approach in selected cases

[8] Dick R. C S and Hurst A Chronic Peptic Ulcer of Oesophagus and Its Association with Congenitally Short Oesophagus and Diaphragmatic Hernia Quart. J Med **11**: 105 (April) 1942.

We believe that surgical treatment of the patient with the complicated short esophagus is a serious undertaking Satisfactory preparation for operation is not easy nor always possible Anemia, malnutrition, and chronic disease increase the risk of surgery Narcotic dependency is occasionally a factor in the patient with intractable pain due to penetrating ulcer

The operation employed in these patients has been similar to that used for esophageal malignancy Essentially it involves a transthoracic resection of the diseased esophagus and cardia with esophagogastrostomy (Fig 3) The long-standing inflammatory process produces severe reaction in the mediastinum, rendering the dissection considerably more tedious than is usual for esophageal tumor Even at the time of surgery, it may be impossible to exclude the possibility of neoplasm

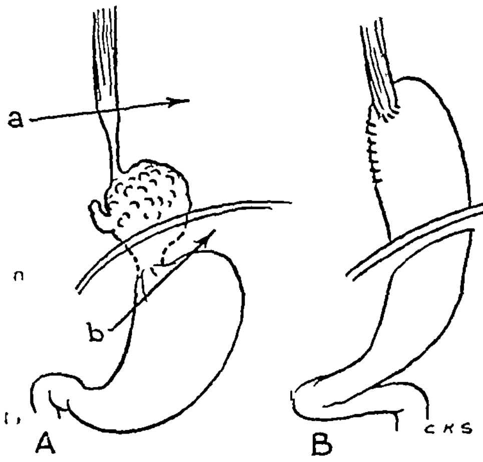

Fig 3 —Schematic outline of surgical technic employed in complicated short esophagus associated with peptic ulcer as illustrated in Figure 2. *A* arrows represent lines of resection with removal of diseased segment of esophagus and cardiac portion of stomach *B* diagram of completed esophagogastrostomy Cardiac stomach has been resected and anastomosis effected on greater curvature and anterior wall of stomach

We have performed this operation on six patients, all of whom were benefited Actually the procedure is palliative in nature, since the patient with esophagogastrostomy is rarely a completely happy person The operation does relieve the ulcer pain, stricture, and bleeding We insist, however, on a prolonged medical regimen in which to manage the expected symptoms of thoracic stomach

UNCOMPLICATED SHORT ESOPHAGUS

The term "uncomplicated" is used here to denote the absence of secondary physical changes altering the morphology of a short esophagus In an effort to develop a simple definitive surgical procedure for correction of this defect, a distinction must be made between the structurally uncomplicated short esophagus and the complicated type described in the foregoing paragraphs Actually the patient who presents the simpler lesion may have suffered any of the listed complications With recognition of the limitations of conservative therapy for a structural defect, a search has been made for a simple corrective procedure Harrington and Olsen have stated repeatedly that the logical treatment of symptomatic short esophagus would involve the reduction of the thoracic stomach within the abdomen When this is possible, there may be permanent remission of symptoms Adjunct procedures, including phrenic crush, gastrostomy, and vagotomy, have been attempted with indifferent results

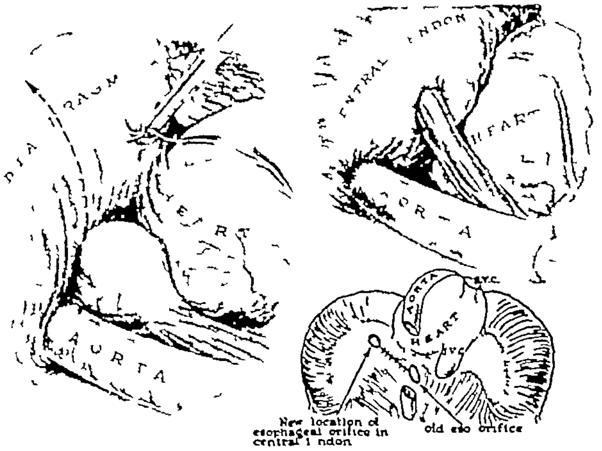

Fig 4 —Artist s conception of anatomic features as viewed through thoracotomy incision during operation for structurally uncomplicated short esophagus with thoracic stomach

Although the esophagus has been shortened e mentally by vagal stimulation,[9] we are unaware of method by which the diseased organ is lengthened cases of minimal shortening, the defect between cardiac esophagus and hiatus may be bridged by traction and fixation after adequate mobilization of the esophagus Sectioning of the vagus alone will permit lengthening b

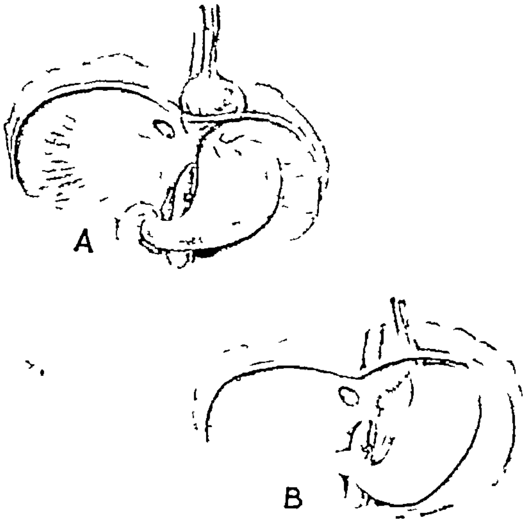

Fig 5 —*A* schematic representation of short esophagus with thoracic stomach and relation to leaves of diaphragm *B* reduction of stomach below diaphragm following paralysis of phrenic nerve and transplantation of esophageal hiatus to central dome of diaphragm

traction but the side effects of vagotomy may offset the advantage of such a procedure

A comparatively simple operation has been used at the Cleveland Clinic with promising results in a small series of cases The operation is basically a transthoracic reduction of the stomach, with alteration in the diaphragmatic hiatus and phrenic paralysis (Figs 4 and 5) Although the esophagus itself is not appreciably lengthened, the vertical diameter of the thoracic cavity is shortened

---

[9] Dey F L Gilbert N C Trump R and Roskelley R C Reflex Shortening of Esophagus in Experimental Animal with Production of Esophageal Hiatus Hernia J Lab & Clin Med 21 499 (May) 1936

The technic parallels the procedure described by Merendino, Varco, and Wangensteen [10] in correction of paraesophageal hiatus hernia A thoracotomy is performed at the level of the eighth left rib, and the pulmonary ligament divided The terminal esophagus and thoracic stomach are completely mobilized from within the mediastinum The phrenic nerve is crushed, and the diaphragm is allowed to elevate A site is selected for the new hiatus, and the diaphragm is incised from this point through the anatomic hiatus Care must then be taken to free the stomach from its posterior and medial attachments along the crura of the diaphragm Emphasis is placed on the necessity for complete mobilization of the terminal esophagus and thoracic stomach, with separation of the mediastinal and subdiaphragmatic attachments It is not necessary for one to divide the gastrohepatic or gastrolienal ligaments After mobilization is accomplished, the cardia of the stomach is brought laterally to the site of new hiatus, the right and left crura are approximated with interrupted double silk sutures, with resultant obliteration of the original hiatus medially and posteriorly to the cardia The stomach is reduced below the diaphragm, and the tendinous portion is closed around the cardiac esophagus One should observe care in tacking the new hiatus completely around the esophagus by means of interrupted silk sutures to prevent sliding or herniation When the repair is accomplished, the cardiac stomach is at the highest point under the dome of the diaphragm, the position normally occupied by the fundus Because the diaphragm is paralyzed, the dome is considerably elevated The combination of new hiatus, plus phrenic paralysis, greatly diminishes the distance traversed by the esophagus In this way, a previously short esophagus may be adequate in length Although the esophagus itself is not lengthened, the required span is shortened

COMMENT

Greater emphasis must be placed on the recognition of short esophagus and its associated complications Special technics used by the experienced roentgenologist, including examinations in the Trendelenburg position, are of paramount importance Inadequacy of medical therapy for short esophagus is largely due to the frequent erroneous diagnosis of duodenal ulcer With early recognition of the entity and adequate *medical therapy*, the patient may be *spared* prolonged discomfort and serious complication

When serious complications have ensued and the disease is refractory to therapy, the possibilities of surgical relief must be considered Whereas the outright indications for surgery are by no means crystallized in our minds, we believe that a more radical approach will be employed in the future It must always be borne in mind that short esophagus is a structural defect that cannot be reduced by conservative measures Although the symptoms may be relieved in many cases by intensive medical therapy, the program must be continued through life, since the underlying cause of the symptoms remains We feel that there is an excellent possibility that surgery will offer permanent relief in selected cases

CLINICAL NOTES

APLASTIC ANEMIA COMPLICATING STREPTOMYCIN TREATMENT OF PULMONARY TUBERCULOSIS

REPORT OF A CASE, WITH RECOVERY

Milton S Sacks, M D , George T Bradford, M D
and
Carroll L Spurling, M D , Baltimore

The major toxic manifestations accompanying prolonged streptomycin therapy are well known Renal damage, vestibular dysfunction, dermatitis, and other sensitivity reactions have all been observed The reported incidence of blood dyscrasias, however, has been very low *The initial report of the Streptomycin Committee* of the Veterans Administration and offices of the Surgeons General of the Army and Navy,[1] stated that of 800 patients treated with streptomycin, in five (0 7%) relatively mild leukopenia with neutropenia developed One case of agranulocytosis occurred in a patient with miliary tuberculosis These reactions were felt to be quite definitely caused by streptomycin in the sense that they were alleviated by its withdrawal Deyke and Wallace [2] recently reported two cases of aplastic anemia, one of which terminated fatally, during streptomycin therapy of 400 patients with tuberculosis at Fitzsimons General Hospital Autopsy of the fatal case revealed pronounced hypoplasia of the bone marrow In reviewing the toxic manifestations encountered during the treatment of 57 patients in the Cornell-New York *Hospital series*, McDermott [3] reported that relative granulocytopenia had been observed in a few cases with acute hematogenous tuberculosis The total leukocyte counts eventually rose to within normal range despite the continuation of streptomycin therapy In one patient with acute brucellosis, who had been receiving 6 gm of streptomycin *daily, thrombocytopenia* developed Recovery was prompt and complete after the discontinuation of

streptomycin A recent report[4] of the Veterans Administration Streptomycin Committee stated that in 5 2% of 1,751 patients treated with streptomycin some type of blood dyscrasia developed

We wish to report a case of aplastic anemia, which occurred as a complication of streptomycin therapy of pulmonary tuberculosis The patient eventually recovered

REPORT OF A CASE

H W, a white housewife, aged 35, was first admitted to the University Hospital on Aug 27, 1945 She had been in good health until four months prior to admission, when she noted the onset of dyspnea, nervousness, anorexia, and weight loss Two months prior to admission she had been seen by a physician who suspected the existence of hyperthyroidism and advised hospitalization

The family history revealed that her father had died of tuberculosis Review of her past history disclosed an episode of pneumonia at 1 yr of age At the age of 9 yr she had an acute bout of fever and painful swollen knee joints No diagnosis was made at that time, but she was later told she had rheumatic heart disease with valvular damage The patient had two attacks of acute pyelitis in 1929 and in 1931 There were two uneventful pregnancies A review of systems revealed frequent acute respiratory infections

On physical examination the patient appeared poorly nourished and chronically ill There was a slight generalized enlargement of the thyroid gland A harsh blowing systolic murmur was heard in the mitral area The heart was not enlarged Examination of the chest revealed limitation of motion on the right side There was marked dullness to percussion at the right apex posteriorly from the first to the fourth ribs Breath sounds were decreased and tactile fremitus was increased over this area No rales were heard The left lung was normal The remainder of the physical examination was essentially normal

Admission laboratory studies revealed the following data red blood cell count, 4,250,000 per cubic millimeter, hemoglobin value, 13 gm , leukocytes, 10,200 per cubic millimeter, with a differential count of 60% neutrophils, 28% lymphocytes, and 12% monocytes platelets, 310,000 per cubic millimeter Routine urine and stool examinations were noncontributory All blood chemical studies were within normal limits An electrocardiogram did not indicate any deviations from normal Repeated basal metabolism rates were normal An x ray of the chest revealed a large amount of patchy infiltration involving the right lung from the apex to the anterior end of the sixth rib Similar infiltration was present in the left lung from the first to the fourth interspaces No definite cavities were noted The cardiac shadow was normal On Aug 31 sputum examination was positive for tubercle bacilli

The patient did not receive any therapy while hospitalized She was discharged on Sept 6, 1945, arrangements having been made for her to be treated at home by a chest specialist A right pneumothorax was performed and maintained The patient was kept on strict bed rest for 12 mo Sputum examinations became negative and moderate activity was allowed The patient gained weight and improved over a two year period Serial x rays of the chest revealed no change in the left lung The pneumothorax was constantly maintained on the right

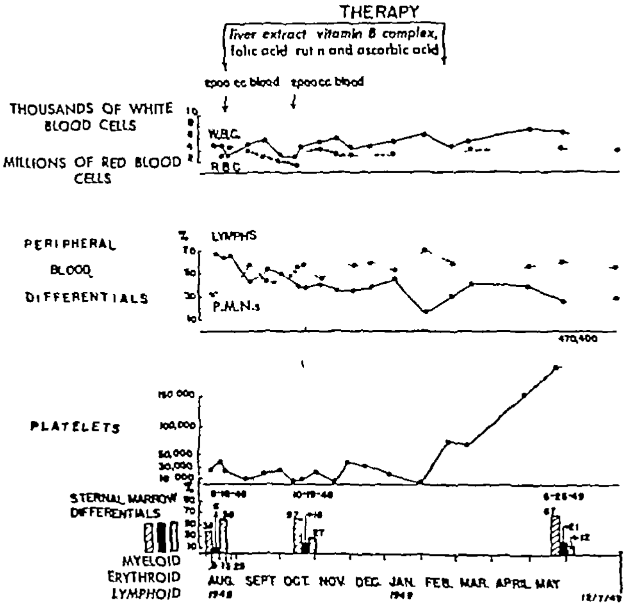
On Feb 20 1948, her sputum again became positive for acid fast organisms Because of this finding the patient was placed on strict bed rest and started on intramuscular streptomycin, 0 8 gm daily (16 mg per kilogram) She continued to receive this dose until June 20, 1948 a period of 122 days The total dose of streptomycin given was 98 gm During this period the lesion in her left lung cleared considerably and she felt much improved Sputum examinations became negative and other routine laboratory studies were said to have been within normal limits

In July 1948, she contracted an acute respiratory infection after which she noted the appearance of marked pallor recurrent elevations of temperature and numerous petechiae and purpuric spots on the extremities Several episodes of spontaneous epistaxis occurred She was seen by her physician and hospitalization was again advised

The patient was readmitted to the hospital on Aug 5, 1948 The significant physical findings consisted of marked pallor of the skin and mucous membranes, numerous petechiae over the extremities and trunk, several large ecchymotic areas on the extremities, a right pneumothorax and a systolic and rumbling presystolic murmur over the mitral area Remainder of the physical examination was essentially noncontributory

Admission laboratory studies revealed a red blood cell count of 2,980,000 a hemoglobin value of 10 2 gm , 4,850 leukocytes with a differential count of 34% neutrophils and 66% lymphocytes, and platelets, 23,840 (counted by Olef's method) All blood chemical studies were within normal limits The bleeding time was 2 min 45 sec , the coagulation time (Lee-White), 7½ min , clot retraction was not complete in 24 hr The prothrombin time was 18 sec with a control of 18 sec The capillary fragility test was markedly positive Several blood cultures and sputum examinations were negative X-ray of the chest revealed a right pneumothorax with an excellent degree of collapse There was slight patchy infiltration demonstrable in the upper left lung No specific cavitation was present

She was given 2,000 cc of whole blood, and, although the red blood cell count and hemoglobin value returned to normal levels, the leukopenia and thrombocytopenia persisted (chart) The differential count continued to show a high percentage of mature lymphocytes Sternal bone marrow examination was done on Aug 18, 1948 The smears showed a marked decrease in cellularity, the predominant cells being small mature lymphocytes Differential count was as follows myeloblasts 3%, promyelocytes 2% myelocytes 2% metamyelocytes 12%, segmented neutrophils 17%, mature lymphocytes 58% and erythroid elements 6% Megakaryocytes were not observed A diagnosis of hypoplastic anemia with secondary thrombocytopenia was made



Summary of patient s course and treatment.

A therapeutic regimen consisting of liver extract, intramuscular vitamin B complex, folic acid rutin and ascorbic acid was initiated The patient was discharged from the hospital on Aug 24 1948 by which time the fever had subsided and the hemorrhage tendency had become less marked The blood studies on that day were as follows red blood cell count 4 050 000 hemoglobin value 11 6 gm 3,000 leukocytes with a differential count of 70% lymphocytes 27% neutrophils 2% eosinophils and 1% monocytes platelets 35 000

Periodic blood studies were made during the next six weeks and therapy was continued as before Occasional spontaneous epistaxis and small showers of petechiae occurred Menstrual periods were somewhat prolonged and profuse Slight hematuria was also observed on several occasions in September On Oct 1, 1948, marked pallor of the skin and mucous membranes was again noted Laboratory studies revealed a red blood cell count of 2,390,000, hemoglobin value of 7 4 gm, 3,050 leukocytes, with a differential count of 44% neutrophils, 48% lymphocytes, 6% monocytes and 2% eosinophils, and 27,600 platelets

---

[4] Streptomycin in the Treatment of Tuberculosis report of the Council on Pharmacy and Chemistry J A M A 138 584 593 (Oct 23) 1948

She was readmitted to the hospital on Oct 16, 1948 Marked pallor, numerous petechiae, and several ecchymotic areas were noted on the extremities The red blood cell count was 1,910,000 and the hemoglobin value was 6 6 gm The patient was again given 2,000 cc of whole blood over a period of four days Bone marrow examination on Oct 18 revealed a moderate increase in cellularity as compared to the marrow previously examined The differential count was as follows myeloblasts 3 5%, promyelocytes 4 0%, myelocytes 9 5%, metamyelocytes 17 0%, segmented neutrophils 23 5%, mature lymphocytes 25%, monocytes 1%, plasma cells 1%, and erythroid elements 15 5%

The patient was discharged from the hospital on Oct 19, 1948, somewhat improved She continued on the therapeutic regimen noted above For a period of several months thereafter there was gradual clinical and hematological improvement The hemorrhagic manifestations diminished The red blood cell count was maintained between 3½ and 4 million without further transfusions The white blood cell count fluctuated between 4,000 and 6,000 and the differential counts became normal in December, 1948 However, the thrombocytopenia persisted In February, 1949, blood studies were as follows red blood cell count 3,500 000, hemoglobin value 11 4 gm 6,600 leukocytes with a differential count of 74% neutrophils, 18% lymphocytes 6% monocytes, and 2% eosinophils, platelets 3,300

The vitamin B complex and folic acid were discontinued in February From February to April 1949, there was further hematologic improvement The platelet level rose steadily Liver extract was discontinued in March, 1949 Blood studies on April 27 1949, revealed a red blood cell count of 4,480 000, hemoglobin value of 13 8 gm, 7,300 leukocytes with a differential count of 59% neutrophils, 39% lymphocytes and 2% monocytes, and 140,800 platelets On May 25, 1949 another bone marrow aspiration was performed Examination of the smears revealed normal cellularity The differential count was as follows myeloblasts 1 0%, premyelocytes 5 0% myelocytes 10%, neutrophilic metamyelocytes 31%, segmented neutrophils 19 5%, lymphocytes 13 0%, and erythroid elements 20 5% Several megakaryocytes were seen Peripheral blood studies were as follows red blood cell count, 4,520,000, hemoglobin value, 13 3 gm, 5,700 leukocytes with a differential count of 61% segmented neutrophils 32% lymphocytes, 4% monocytes, 2% eosinophils, and 1% basophils platelets, 200,000

In Aug 1949, progression of the tuberculous process in the left apex necessitated readmission to the hospital for performance of a lucite plumbage The patient withstood the procedure well and had no unusual hemorrhagic phenomena The blood picture was essentially normal at this time except for moderate thrombocytopenia (260,000 per cubic millimeter) When last seen on Dec 7, 1949, she was completely asymptomatic, had gained weight, and presented the following blood picture red blood cell count, 4,970,000, hemoglobin value, 14 1 gm, 6,600 leukocytes with a differential count of 58% neutrophils, 33% lymphocytes, 6% monocytes, 2% eosinophils and 1% myelocytes platelets, 470,400

COMMENT

When first seen in 1945, prior to streptomycin therapy, the patient's peripheral blood picture was essentially normal During the four-month period of streptomycin administration she was at home, and there were no recorded blood counts Several weeks after discontinuance of the drug, purpuric manifestations appeared On admission to the hospital, detailed study revealed a picture compatible with the diagnosis of aplastic anemia There was no history of exposure to other agents or drugs which have been reported to produce hypoplasia of the bone marrow, nor was there any evidence of miliary spread of the tuberculous infection

During the first six months after streptomycin had been discontinued, very little hematological improvement occurred in spite of supportive therapy The leukocyte count and differential pattern became essentially normal by December, 1948, approximately six months after onset of illness The hemoglobin and red blood cell values rose to normal during the next three months The platelets, on the other hand, did not reach normal until approximately 16 mo after onset It is interesting to note that during the last hospital admission (August, 1949) when exacerbation of the tuberculous process had occurred, no hematological regression was observed The most recent blood studies indicate an essentially normal picture

The evidence incriminating streptomycin as the agent responsible for the aplastic anemia in this case is, of course only circumstantial One must consider first the influence of tuberculosis itself on the hematopoietic system It is well known that anemia, granulocytopenia, and/or thrombocytopenia have been observed in acute hematogenous tuberculosis with bone marrow involvement A decrease in granulocytes and/or platelets has also been observed following the injection of tuberculin in patients with active pulmonary tuberculosis [5] The latter observation led to the suggestion that perhaps a similar mechanism may be responsible for the granulocytopenia and thrombocytopenia occasionally seen in such patients However, a careful search of the literature failed to reveal typical cases of aplastic anemia due to tuberculosis per se except when miliary spread was present The case presented here displayed no evidence of miliary dissemination

The mechanism of the development of hypoplasia of the bone marrow during streptomycin therapy is unknown No evidence exists for a direct toxic effect on the hematopoietic system However, bone marrow hypoplasia can occur as a result of the creation of a folic acid deficiency [6] Lucherini and Schiavetti [7] observed that streptomycin administered orally to rats and chickens produced a macrocytic anemia, granulocytopenia, and hypoplasia of the bone marrow The peripheral blood picture as well as the bone marrow were rapidly restored to normal by the oral or parenteral administration of folic acid The experiments seemed to indicate that, at least in rats and chickens, the bacterial flora of the intestinal tract plays an important part in the synthesis of folic acid It was suggested that the toxic hematopoietic effect of streptomycin was due to its bactericidal action on the intestinal flora The possibility that prolonged administration of streptomycin may, as a result of its effect on the bacterial flora of the human intestinal tract, produce a folic acid deficiency must be considered This could result in hypoplasia of the bone marrow

In the treatment of acute leukemia with the folic acid antagonists, some authors [6b] have observed hypoplasia of

Lucherini T and Schiavetti L Experimental Macrocytic Anemia on Oral Administration of Streptomycin and Restoration of Blood Picture to Normal by Administration of Folic Acid Policlinico (Sez prat) 55 [illegible] 73 (Jan 19) 1948 the bone marrow, ulcerative stomatitis, alopecia, and diarrhea Beham and Perr[8] have reported the development of an ulcerative aphthous stomatitis in three patients with pulmonary and extrapulmonary tuberculosis during streptomycin therapy The hematological picture was not discussed, but the description and photographs of the ulcerative stomatitis appeared quite similar to that observed by us in patients with a folic acid deficiency induced by the therapeutic use of folic acid antagonists

Since streptomycin therapy has become widespread in the treatment of many human infections, the minor toxic manifestations will probably assume greater importance At the present time, it would seem advisable to consider anemia, granulocytopenia, and thrombocytopenia collectively as a manifestation of streptomycin toxicity and an indication for the immediate discontinuation of therapy

SUMMARY

A case of aplastic anemia following prolonged administration of streptomycin is presented Gradual recovery took place over a period of 16 mo after the discontinuation of the drug

It is suggested that prolonged courses of streptomycin, by virtue of an effect upon the bacterial flora of the human intestinal tract, may produce a folic acid deficiency with subsequent hypoplasia of the bone marrow

THROMBOPENIC PURPURA DURING STREPTOMYCIN TREATMENT OF TUBERCULOUS EMPYEMA

REPORT OF A CASE

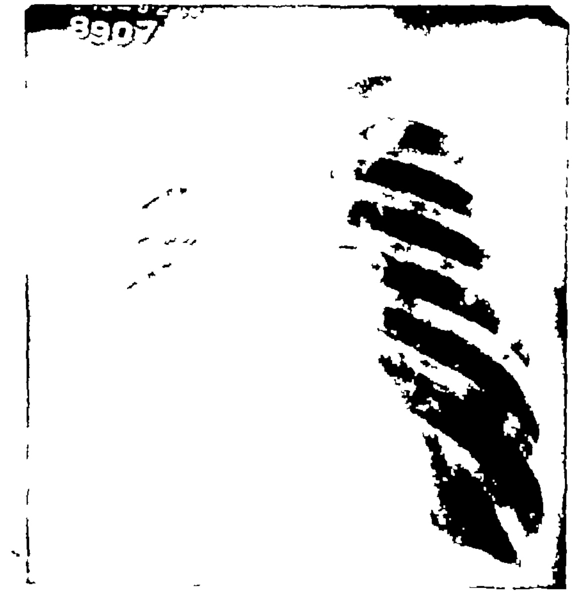
Herman Rudensky, M D, Ft Wayne, Ind
and
Seymour Fisher, M D, Phoenix, Ariz

Incidence of severe toxic reactions in the hematopoietic systems of patients treated with streptomycin has been very small The Central Streptomycin Committee of the Veterans Administration reported only 0 6%-2 3% of blood dyscrasias in 1,751 patients treated under streptomycin regimens in the federal hospitals[1] The great majority of these reactions consisted of relatively mild leukopenia and granulocytopenia, however two cases of aplastic anemia apparently caused by streptomycin were reported by Deyke and Wallace[2] A M Walker,[3] secretary of the Central Streptomycin Committee informed us that he knew of no case of thrombopenic purpura occurring during the administration of streptomycin in any patient treated in the United States In one patient with miliary tuberculosis treated with streptomycin by Feld[4] agranulocytosis developed Benhamou and others[5] reported that in one child with tuberculous meningitis, treated with 2 gm of streptomycin daily, agranulocytosis with purpura developed on the 30th day of therapy, and the child died within 48 hr Keefer and others[6] in a report of 1 000 cases treated with streptomycin, mentioned one case of purpura hemorrhagica occurring in a patient treated with streptomycin Since no details were given, the case presumably was fairly mild To our knowledge there has been no instance in the American literature of severe thrombopenic purpura developing during or after streptomycin therapy It may, therefore, be of interest to report one such case occurring in a patient treated with streptomycin bringing to the attention of the medical profession the possibility of such a reaction especially when a patient has a history of previous administration of this antibiotic

REPORT OF A CASE

History—B S a white man aged 32, gave a history suggestive of pulmonary tuberculosis since July 1946 that was confirmed bacteriologically and by x-ray studies a month later when a diagnosis of active pulmonary tuberculosis of the right upper lobe was made Pneumothorax was started on the right side in September, 1946 and was followed by pneumonolysis The patient responded well to therapy, smears and cultures of his sputum and gastric contents became negative for acid fast bacilli

During April, 1947, a course of streptomycin was started, but after the administration of only 2 gm over a period of two days further antibiotic therapy was refused by the patient because of local burning pain About May, 1948 a tuberculous empyema developed on the right side the patient was treated by repeated aspirations and irrigations of the pleural cavity with chloroazodin (azochloramid®) solution There was some improvement in his condition



Roentgenogram of chest Sept 2, 1948 showing tuberculous empyema

Physical Examination and Laboratory Data—On Aug 31 1948 he was admitted to Billings Veterans Administration Hos

pital, where a physical examination seemed to indicate that he was in good general condition His temperature was 98 4 F, pulse, 80, blood pressure, fluctuating between 156/92 and 126/90 No history suggestive of any previous blood dyscrasias was elicited, no signs of petechiae or ecchymoses were noted His medication consisted of vitamins, and occasional phenobarbital and secobarbital (seconal®) sodium

Operation—Because of a markedly thickened pleura interfering with reexpansion of the right lung, tuberculous empyema, and extensive nodular involvement of the right upper lobe, a decortication of the right lung and a five rib thoracoplasty were performed by Dr L Nehil on Oct 29, 1948, and Nov 15, 1948, respectively

On Oct 28, 1948, in anticipation of surgery, streptomycin therapy had been started, 0 5 gm being given twice a day for 25 days Penicillin (50,000 units every three hours) was administered at the same time for 26 days On Oct. 30, 1948, the patient began to run a fever, rising to 100 8 F, which persisted for about a week His general condition was fair Because of secondary anemia, 500 cc of blood were given Nov 5, 1948

Laboratory Findings in a Case of Thrombopenic Purpura

1/26/49	4 02	14 4	13.5	72	20	2	5					
1/27/49								90 0		7 30		

Postoperative Course—After the thoracoplasty the patient bled more than usual from the operative wound, his hemoglobin dropped to 8 5 gm, while his red blood cell count was reported to be 2,790,000 Four transfusions, each of 500 cc of blood, were given to him, every other day, to combat the effects of hemorrhage

On Nov 24, 1948, he was returned to the tuberculosis service, where, on admission, he appeared to be pale and anxious numerous petechiae and ecchymoses were scattered over his abdomen, arms, and legs as shown in the illustration His spleen did not appear to be enlarged at that time While under medical observation he complained of attacks of pain in the lumbar region and gross hematuria and nosebleeds developed His pulse fluctuated between 80 and 100, blood pressure between 148/98 and 98/58 He ran an occasional low grade fever, rising to about 99 6 F On Nov 28 1948 his hemoglobin was found to be 10 gm, his red blood cell count was 3,210,000 The Leede Rumpel phenomenon was markedly positive Clot retraction on Nov 28, 1948, was reported to be very poor in five hours, a few days later, only slight clot retraction was noted in 24 hr There was a very marked decrease in blood platelets, none being observed in 1,000 cells on Dec 3, 1948 Examination of urine repeatedly showed gross blood and 4+ albumen, and (on microscopic examination) innumerable red blood cells and white blood cells were seen The prothrombin percentage fluctuated between 85% and 95%, icterus index, between 5 and 8 The red blood cell fragility and congo red test were essentially normal Numerous sputum examinations and gastric contents examinations, including four cultures, were negative for acid fast bacteria The patient was tested with a 1 8,000 streptomycin solution intracutaneously, an ecchymosis was found the next day at the test site This test was hard to interpret because of a tendency for ecchymoses to develop in the patient after a mild trauma On Dec 28, 1948, Dr P J Fouts reported that a bone marrow smear showed some hyperplasia of the granular cells with a 7% eosinophilia The megakaryocytes were increased in number, but no blood platelet formation was noted It was felt that findings in the bone marrow were compatible with a diagnosis of allergic thrombopenic purpura, probably due to streptomycin The patient was empirically given vitamin K, crude liver extract, rutin, and occasional injections of meperidine (demerol®) hydrochloride for pain but there was no improvement in his condition Numerous petechiae and ecchymoses continued to develop On Nov 30, 1948, transfusions of citrated blood varying in amount from 250 cc to 500 cc each were started These were given every other day for two weeks, because of no definite improvement, 10 daily transfusions were then given About Dec 18, 1948, the interval between transfusions was increased to three days, and they were finally discontinued on Dec 30, 1948 Because of an allergic reaction, antihistamines were administered to the patient at the same time

With this treatment, the patient improved gradually His hemorrhages decreased in amount and became less frequent the petechiae and ecchymoses subsided The Leede Rumpel phenomenon became less positive, and on Jan 11 1949, it was es sentially normal On Dec 28, 1948, the spleen had appeared to be somewhat enlarged for the first time and it remained definitely palpable for a few weeks The patient s hemoglobin value and red blood cell count increased gradually, showing a tendency to become stable without the help of transfusions Blood platelets increased gradually and were reported to be 32 000 per cubic millimeter on Dec 15, 1948 58,000 on Jan 16, 1949, and about 90,000 at the beginning of February, 1949 Details of the laboratory findings are given in the Table It was the impression of the medical staff that the patient had a thrombopenic purpura, probably caused by streptomycin A splenectomy was considered, but in view of the progressive although slow improvement in the patient s condition, the decrease in the amount of bleeding, the increase in blood platelets, and the apparently allergic type of purpura it was felt that a splenectomy was not indicated, especially in view of the preceding two major operations

During the patient s last examination at Billings Veterans Administration Hospital on Feb 2, 1949, only a few small petechiae were noted on his forehead while his spleen showed evidence of a decrease in size

The patient left the hospital against medical advice on Feb 2, 1949 He was seen as a follow up patient on June 22 1949 at Hines (Ill) Veterans Administration Hospital, where no findings of purpura were noted during the examination

COMMENT

Thrombopenic purpura developed in this patient following the administration of 25 gm of streptomycin No other drug definitely known to have a toxic effect on blood platelets was given to the patient A significant factor might have been the sensitization of the patient by the administration of 2 gm of streptomycin during April, 1947 Whether the two major operations performed on the patient on Oct 28, 1948, and Nov 15, 1948, made him more susceptible to the effect of streptomycin is conjectural It is interesting to note that the amount of streptomycin administered to the patient before purpura developed was relatively small In the cases reported by Feld, Deyke, and Wallace blood dyscrasia began to manifest itself after the administration of 70 to 80 gm of streptomycin The bone marrow findings were suggestive of an allergic type of purpura

SUMMARY

A case of thrombopenic purpura is reported in a patient affected with quiescent pulmonary tuberculosis and tuberculous empyema He was treated with decortication, a five-rib thoracoplasty, and 25 gm of streptomycin It is felt that this case of purpura hemorrhagica was most probably precipitated by the streptomycin

ADDENDUM

The patient was last seen at the Fort Wayne (Ind) Veterans Administration Hospital between Jan 22, 1951, and Feb 9, 1951 His general condition was very good Scattered bluish ecchymoses on both arms and legs with a few petechiae were noted The red blood cell count was 5,460,000, with a hemoglobin value of 15 gm The white blood cell count was 14,520, with 78% polymorphonuclear leukocytes and 20% lymphocytes The blood platelets numbered 94,000 The bleeding time was 15 minutes and the coagulation time (Lee-White) was 16 minutes There was only slight clot retraction at the end of five hours The prothrombin time was 18 seconds The Leeds-Rumpel phenomenon was positive

FIBRINOUS BRONCHITIS

REPORT OF CASE

John A Callahan, Boston

Fibrinous bronchitis has been recognized as a disease entity for many years, probably because of its outstanding characteristic, the expectoration of bronchial casts by the patient It was known to Galen, who considered the casts to be blood vessels expectorated from the lung It was not until 1750 that Bussiere established that the casts were bronchial secretions when he demonstrated a cast in situ at autopsy Lebert, in 1869, collected all the cases in the literature up to that time, a total of 44 cases Bettman collected 145 cases from 1869 to 1902 [1] Walker found 31 cases reported from 1900 to 1920 [2] Since 1920 there have been about 26 cases reported, bringing the total reported cases to between 180 and 200 It is the purpose of this report to record a case which presented some interesting features

REPORT OF A CASE*

A Negro woman, 54 was admitted to the Massachusetts Memorial Hospitals on Oct 16 1950 complaining of difficult breathing and cough productive of white branch like sputum of three months duration Three and one half years ago the patient had had an episode of chest pain which was aggravated by breathing and coughing and accompanied by fever These symptoms disappeared in a week or two but have returned since to a lesser degree, with upper respiratory infections Over a period of seven months she lost 80 to 100 lb (36 3 to 45 4 kg) and complained of dizziness and drenching night sweats Eight months prior to the present illness swelling and pain developed in the calf muscles of the left leg Nine days later she noted recurrence of left pleuritic chest pain and cough productive of white "ropy" sputum

On Feb 26 1950, she was admitted to another hospital with a diagnosis of pulmonary embolization and infarction (although there was no roentgenographic confirmation) deep thrombo phlebitis of the left leg bronchitis and possible broncho pneumonia

Three days after discharge she sustained a superficial injury with some bruising of the face and flank on the right side and the right leg She became dyspneic again and was readmitted to the same hospital on April 5, 1950 The changes in physical examination at this time included slight distension of the neck veins but no hepatojugular reflex The chest showed signs of diminished tactile and vocal fremitus with inspiratory crackling rales at the right base Pulmonic second sound was louder than aortic second sound, but the examination of the heart was otherwise unchanged There was tenderness of the right flank and ecchymosis of the right leg was present Laboratory data at this time revealed hemoglobin 10 Gm , leucocytes 8 600 and sedimentation rate 5 mm in one hour Two green reactions were obtained in tests of the urine for sugar Blood culture yielded no growth Gastric washings injected into a guinea pig in February were reported as negative for tuberculosis Electrocardiogram showed sinoauricular tachycardia and incomplete auriculoventricular block She was discharged on April 10 1950 improved with diagnoses of arteriosclerotic heart disease cardiac enlargement sinoauricular tachycardia early mild cardiac decompensation and possible diabetes mellitus

After discharge she felt weak had pains in her right chest and cough which was productive of a moderate amount of white

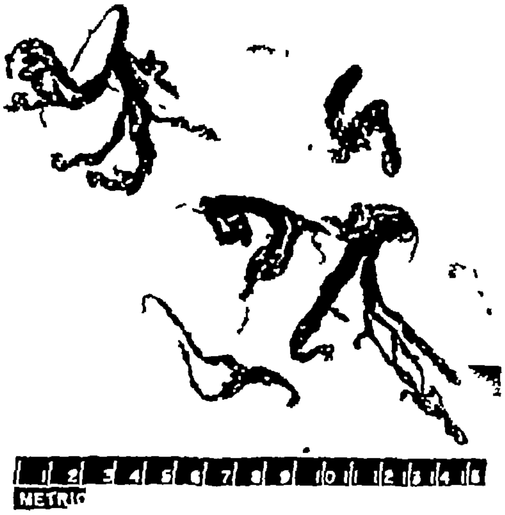
[1] Bettman M Report of a Case of Fibrinous Bronchitis with a Review of All Cases in the Literature Am J M Sc 123 [illegible] 1902

[2] Walker J C Two Cases of Fibrinous Bronchitis with a Review of the Literature Am J M Sc 150 825 1920

foamy sputum, but no hemoptysis These symptoms continued with no increase in severity and with few remissions until about three months before the present admission Early in August, 1950, she noted the onset of dyspnea severer than usual, wheezing localized to the right anterior superior portion of the chest, and violent coughing with blueness of the face After several minutes of coughing, she expectorated a 'white branch or tree like thing and felt much relieved After expectoration, she felt a hollowness in the right side of her chest She continued to have these episodes of dyspnea and cough productive of casts almost every day before admission She reported that she coughed up between four and six casts each day, that some of them were tipped with blood, and that they were most often expectorated shortly after waking in the morning or about midnight She was seen by the Home Medical Service of the Massachusetts Memorial Hospitals on Oct 12, 1950 and admitted to the hospital

Her past history was noncontributory Her family history revealed a half sister had died of tuberculosis 15 years ago, but the patient denies any but the most casual contact with her The patient s husband was said to have "a spot on the lung," but investigation in 1948 revealed pulmonary fibrosis and bronchiectasis, with guinea pig cultures negative for tuberculosis

The patient was an obese Negro woman she was able to sit up in bed, was breathing with some difficulty and coughing occasionally, but was in no acute distress Her temperature was 99 F pulse, 100 per minute respirations 25 and blood pressure 138/88 The skin showed no scaling eruptions, or abnormal pigmentation Examination of the head revealed no abnormalities A nontender lymph node, 1 cm, was palpable in the left jugulodigastric region The anteroposterior diameter of the chest was increased Respiratory expansion of the two sides of the chest was equal Respirations were deep and somewhat labored The apex impulse was not palpable The left border of cardiac dullness was 2 cm beyond the midclavicular line The rhythm was regular except for occasional extrasystolic beats A grade one systolic murmur was heard in the fourth intercostal space to the left of the sternum Pulmonic second sound was louder than aortic second sound There was prolongation of expiratory breath sounds slightly diminished resonance and moist rales over the lower third of the right chest posteriorly Diaphragmatic excursion was equal bilaterally 2 3 cm Vocal and tactile fremitus were unaltered Examination of the abdomen revealed an obese abdominal wall, one right upper quadrant and one midline hypogastric scar, vague tenderness but no spasm in the right upper quadrant, and no organs or masses palpable The anus was constricted and would not admit the examining finger Pelvic and neurologic examinations were normal The extremities showed 1 + pitting pretibial edema and a nontender thrombosed vein in the left calf posteriorly



Bronchial casts

Pathologic description of the casts was as follows Specimen consists of three 'bronchial casts (fixed in Zenker's solution) apparently having arisen from main stem bronchi and the primary division thereof (figure) Each cast measures approximately 4 cm in length and 1 0 to 0 4 cm in diameter Cross section reveals fine cystic structure Microscopic study indicates that sections of the casts are composed of mucus, fibrin albuminous precipitate, scattered cells (some well preserved and others degenerated and necrotic) and interspersed vacuoles representing entrapped air No bacterial colonies or tumor cells were noted.

On admission the hematocrit was 53 (Wintrobe) and the hemoglobin 17 Gm Other laboratory studies were normal, but the roentgenogram of the chest showed enlargement of the right auricle, atelectasis at the right base, pulmonary congestion, and a cardiac configuration consistent with a small pericardial effusion Shortly after admission the temperature became elevated to 103 4 F rectally, and she had dyspnea, tachycardia, and pain in the right shoulder At this time venous pressure was 220 mm (citrate), and arm to tongue circulation time was 38 seconds (dehydrocholic acid [decholin®])

On the second hospital day her cough diminished, although small casts were still being expectorated The blood pressure fell to 88/72, and the pulse rose to 110 The right border of cardiac dullness was found to be 5 cm to the right of the midsternal line The left border of cardiac dullness was 2 cm to the left of the point of maximal cardiac impulse There was no increase in venous distention and the lungs were clear to auscultation and percussion Fluoroscopy at this time revealed a small pericardial effusion The leucocyte count rose from 7,700 to 13 900, and the electrocardiogram showed a P R interval of 0 24 seconds and right ventricular strain

The patient became asymptomatic on the fourth hospital day and expectorated no more casts during her hospital stay Except for transient laryngitis, which responded quickly to symptomatic treatment, and temperature elevations every third or fourth day to 100 or 101 F, she remained asymptomatic

Results of acid fast studies by sputum smear throat smear smear of bronchoscopic specimen, and repeated gastric washings were negative An intradermal first strength purified protein derivative test was normal, while the result of second strength was strongly positive at 24 and 48 hours Repeated sputum cultures grew beta hemolytic Streptococcus alpha hemolytic Streptococcus, Hemophilus influenzae, Micrococcus pharyngis sicca Neisseria flava and Micrococcus catarrhalis and on one occasion Escherichia coli Corynebacterium diphtheriae was not seen After the initial rise, the leucocyte count returned to normal but revealed a progressively increasing eosinophilia reaching 17% on one occasion, which persisted until shortly before discharge The result of an intradermal test (Bachman) with trichina extract was negative Bronchoscopy was performed on the 14th hospital day No gross lesions or casts were seen All bronchial orifices were well visualized A small amount of thin colorless secretion was seen issuing from the right main stem bronchus Acid fast smears and results of Papanicolaou studies on this material were negative Vital capacity studies at regular intervals were consistently between 2 3 and 2 6 l Venous pressure toward the end of the hospital stay was 205 mm (citrate), and circulation time was 24 seconds (dehydrocholic acid) The patient was digitalized slowly and adjusted to a maintenance dose of digitoxin She was discharged asymptomatic, but febrile, on the 32nd hospital day

COMMENT

Fibrinous bronchitis is usually described as a rare disease but its true rarity is somewhat in doubt Walker, in 1920, knew of three unreported cases in addition to the two he reported, and suggested that "a more careful examination of the sputum of patients with bronchitis and the like, would probably result in a still greater yield of cases of fibrinous bronchitis" The casts are expectorated as white masses in the sputum, which when floated in water can be made to unravel and show their branched form They may be small portions of a larger cast or may

[illegible] (a) [illegible] F T Diseases of the Bronchi Lungs and Pleura ed 2 [illegible] Lea & Febiger 1925 (b) West S Diseases of the Organs of Respiration London Griffin & Company Ltd 1902 be almost exact reproductions of the bronchial tree [3] They are composed of fibrin and mucin, and at one time they were classified according to the predominating substance This classification is no longer considered useful The casts may contain desquamated epithelial cells, bacteria, red blood cells on the surface although rarely in the substance, and, according to some authors, Charcot-Leyden crystals and eosinophils [4] The large portions of the cast may be hollow, although they usually are filled with mucus and do not admit air, while the smaller terminal portions are uniformly solid and may resemble Curschmann's spirals The bacteria that have been isolated from the casts include streptococci, staphylococci, pneumococci, Corynebacterium diphtheriae, Klebsiella pneumoniae Mycobacterium tuberculosis, and Hemophilus influenzae [5]

Walker expressed the opinion that fibrinous bronchitis should be considered a primary disease and that casts formed during the course of other diseases should be considered symptomatic of those diseases [2] Most authors believe, however, that primary and secondary forms exist and that acute and chronic courses are seen in both forms [6] It has been reported in association with other pulmonary diseases such as tuberculosis, asthma, bronchial compression due to tumor to aneurysm, to enlarged bronchial glands, fungus infection, chronic passive congestion or heart disease, pulmonary edema, and conditions after exposure to noxious inhalants such as live steam, smoke, and ammonia General constitutional disturbances with which it has been reported include typhoid fever, scarlet fever, smallpox, rheumatism, influenza, erysipelas, diphtheria, pemphigus, impetigo, and herpes zoster It is reported to be more frequent in males and commonest between the ages of 10 and 30 years

There is no specific etiology known Many different bacteria have been isolated, as mentioned before, but none of these has been found consistently Rakower believes that a constitutional predisposition exists and that the disease is produced by a precipitating factor such as bacterial infection or mechanical or physiochemical influences Weber [6f] observed a case in association with exophthalmic goiter which improved when the thyrotoxic disease did The disease has been compared to mucous colitis as an upset of the autonomic and endocrine systems Roth, reporting in 1938, felt the disease to be related to allergic reactions and histamine He treated one patient successfully with torantil[8] (a histaminase preparation) intramuscularly After the disappearance of symptoms, histamine was given subcutaneously, and relapse followed The relapse was treated successfully with torantil [8] This report is difficult to evaluate in the light of a report by Feinberg in 1946, which stated that all histaminase preparations available to the date of his publication were inactive in the treatment of allergic states or diseases in man [9] Keizer, in 1949 thought the disease resembled asthma and suggested the use of antihistaminic drugs for treatment, although he did not use them in his case [4a]

There are three cardinal symptoms of the disorder dyspnea, cough and expectoration of casts There is great variation in the severity of these symptoms from expectoration of casts after hawking to suffocating dyspnea and violent paroxysmal coughing In some cases the casts cannot be coughed up, and the patient dies of asphyxia There is usually some degree of fever which however is in no way characteristic Chills may precede the paroxysm of dyspnea, and hemoptysis of varying amount may follow Acute cases are usually marked by severe dyspnea and sometimes by deep cyanosis The severity of symptoms may depend on the extent of bronchial involvement The chronic form is much more frequent The expectoration of casts may occur at intervals over many years and during the periods of active disease one to ten casts may be produced daily [10]

The physical signs are not characteristic and the diagnosis must be made on the basis of casts found in the sputum [3b] Rales and diminution of breath sounds and resonance may be heard over an area where casts are forming Any type of rales may be heard, including one perhaps more characteristic than others, a rough, snapping, bronchial type believed to be caused by flapping of the ends of the casts in the bronchi and to which the French have given the name *bruit de drapeau* [11] Other physical signs due to associated disease or to complications such as bronchostenosis, focal or massive atelectasis may be observed [12] Chronic emphysema is often seen in cases of long standing Considerable loss of weight may occur without any other explanation Night sweats have been reported in cases in which no acid-fast infection could be demonstrated [1] Roentgenographic findings are also not specific They are increased hilar density and increased bronchovascular markings [13] Walker described mottling of the lung fields in one case [2]

Prognosis in cases other than those in which the patient dies of asphyxia is largely dependent on the associated diseases In uncomplicated, primary cases in which casts are expectorated periodically without great difficulty, the patient may live normally between paroxysms Many cases clear up completely without recurrence [14] Those acute cases resulting in death from asphyxia are relatively uncommon, although Johnstone reported one in 1945 [10c]

The treatment of this disease has been varied and has included inhalations of steam, calcium hydroxide solution (lime water) spray, dilute sodium hydroxide with calcium hydroxide solution, potassium iodide, mild mercurous chloride (calomel), lead acetate, sulfur, nitrous ether (sweet spirit of nitre), phlebotomy, ipecac, antimony and other emetic measures, sulfapyridine, penicillin, torantil,® manual compression of the chest during expiration, pneumothorax, bronchoscopic removal of the cast, and tracheotomy [15]

SUMMARY

A case of fibrinous bronchitis is reported in a woman who had had thrombophlebitis of the deep calf veins and pulmonary infarction in the past The main features of the disease are reviewed, and attention is directed to the fact that this form of bronchitis is perhaps commoner than is generally supposed It is overlooked, because the sputum of patients with bronchitis is not always examined in such a way as to result in detection of the casts

RETICULUM CELL SARCOMA OF MESENTERY

CASE WITH PRONOUNCED FEBRILE MANIFESTATIONS

Bernard T Fein, M D , San Antonio, Tex
and
Benjamin L Schulman, M D , Pittsburgh

Jackson and Parker [1] found that pronounced fever was rare in reticulum cell sarcoma unless associated with sepsis Gall and Mallory [2] noted that fever of 101 F or higher occurred at some time during the course of the disease in all the malignant lymphomas, but was relatively uncommon in clasmatocytic (25%) and stem cell (29%) lymphomas

Gall and Mallory,[2] in offering a different classification of malignant lymphomas in a study of 618 cases divided the specimens into seven categories The "reticulum cell sarcomas" were divided into two types (1) stem cell lymphomas (tumors composed of highly undifferentiated, supposedly pluripotential cells, called stem cells) and (2) clasmatocytic lymphomas (tumors made up of fairly well differentiated cells, simulating normal clasmatocytes or monocytes, the cells being smaller than stem cells, but distinctly larger than lymphocytes) The other five categories of malignant lymphoma are (3) lymphoblastic lymphoma, (4) lymphocytic lymphoma, (5) Hodgkins lymphoma, (6) Hodgkins sarcoma, and (7) follicular lymphoma Other classifications have been given for malignant lymphomas [3] and reticulum cell sarcomas [4]

Gall and Mallory [2] studied a group of 70 initially localized malignant lymphomas, of which 32 were "reticulum cell sarcomas " Three of these were found in the abdominal lymph nodes, one being a stem cell lymphoma, its duration one to two years, and its ultimate distribution generalized Two were clasmatocytic lymphomas of the abdominal lymph nodes The first was of 0 5 years' duration, the ultimate distribution generalized, the diagnosis being made at autopsy, the other was of 1 1 years' duration, and the ultimate distribution local Of the three cases, only one was of local ultimate distribution Edling [4b] found that a marked characteristic of reticulum cell sarcomas was their pronounced tendency to become generalized

The purpose of this report is to record a case of reticulum cell sarcoma of the mesentery, in which high septic fever was a pronounced manifestation, and whose ultimate distribution was apparently local

REPORT OF A CASE

An Oriental Moslem man, age 35, was admitted to the hospital on Aug 31, 1948, with a chief complaint of fever The present acute illness had started approximately two months prior to admission At that time, symptoms were anorexia, nausea, and mild diarrhea The patient was treated by his physician, with complete abatement of symptoms in a few days Two weeks prior to admission he developed a fever of 101 F , complained of sore throat, which on examination by his physician was reported as injected At that time, he was given sulfathiazole then he received intramuscularly 300,000 units of penicillin daily In spite of the treatment, the temperature was 100 6 F rising to 103 F on the evening of admission He complained of being hot and weak He had no pain, and there was no apparent weight loss or gastrointestinal complaints

The past history disclosed the following During childhood, while in India, an incision and drainage of the glands on the right side of the neck had been done There were no complications resulting He had no other operations or illnesses prior to the onset of his present illness He had no previous gastrointestinal disease or fever He denied syphilis malaria, and all diseases endemic to his native country India

When seen for the first time, he was acutely ill and weak The temperature was 100 6 F , pulse 108, respirations 22 per minute, and blood pressure 102 systolic and 70 diastolic (mm Hg) Slight pallor of the lips was noted, and there was no apparent weight loss Examination of the head was normal The eye grounds showed no exudates, hemorrhage, or papilledema The conjunctivae showed no icterus The ears and nose were not remarkable The teeth were normal, as was the throat There was a small healed scar over the right side of the neck in the area of the anterior cervical glands The anterior and posterior cervical glands were not tender or palpable The lungs were resonant to percussion and no rales were found The heart tones were of good quality, and a sinus tachycardia was present

The abdomen, which was not distended or rigid, was tympanitic on percussion and normal on auscultation The liver, spleen, and kidneys were not tender or palpable A mass about orange size was palpable just to the left of the umbilicus The mass was firm, round and neither tender nor movable There was no pulsation felt or abnormal sound heard The genitalia were normal The extremities were warm, the pulses were easily palpable The axillary and inguinal glands were not tender or palpable Rectal examination was normal

The urinalysis at the time of admission revealed no significant abnormalities The red blood count was 3,950,000, hemoglobin 11 Gm , the white blood count 12,050, a differential count showed neutrophils 65%, lymphocytes 32% eosinophils 2%, and basophils 1% A roentgenogram of the patient's chest was

reported as follows The heart and great vessels are normal The apices are clear, there is no pleural effusion The hilar glands are increased in size There is no evidence of tuberculosis The electrocardiogram on admission revealed a sinus tachycardia rate 120 A blood smear was taken for malaria, and agglutination tests were performed with typhoid O and H antigens, paratyphoid A and B, Proteus O X_{19}, and Brucella abortus

Penicillin was administered intramuscularly, 300,000 units twice daily, and quinine sulfate 0 33 Gm was given orally four times daily as the temperature began to rise

On the second hospital day the temperature was 100 F the patient had no complaints other than those of fever and weakness He continued to have daily elevations of temperature in spite of the treatment he was receiving (fig 1) On the fifth hospital day, intramuscular administration of penicillin and quinine sulfate taken orally were discontinued The patient was given sodium sulfathiazole, 4 Gm at the start and 1 Gm every four hours A blood cell count done at this time showed red blood cells 3 430,000, hemoglobin 9 3 Gm , and white blood cells 9,500 Differential count showed neutrophils 85% lymphocytes 13% eosinophils 1% and basophiles 1% Urine was normal A malaria smear showed no plasmodia A throat smear was negative Sputum cultures for tubercle bacilli were negative Stool examinations revealed no ova or cysts Agglutination tests with typhoid O and H antigens paratyphoid A and B Proteus O X_{19}, and Brucella abortus gave negative results Heterophil antibody titer was 1 7 A blood culture taken on the first hospital day showed no growth The result of the spinal fluid Kolmer test was negative There was no increase in pressure cells sugar, or protein A roentgenogram of the patient s chest was reported as follows Since the last examination there has been no change in the appearance of the hilar glands An area of right hilar density may represent a small area of pneumonic consolidation or could represent enlarged hilar glands There is no evidence of tuberculosis

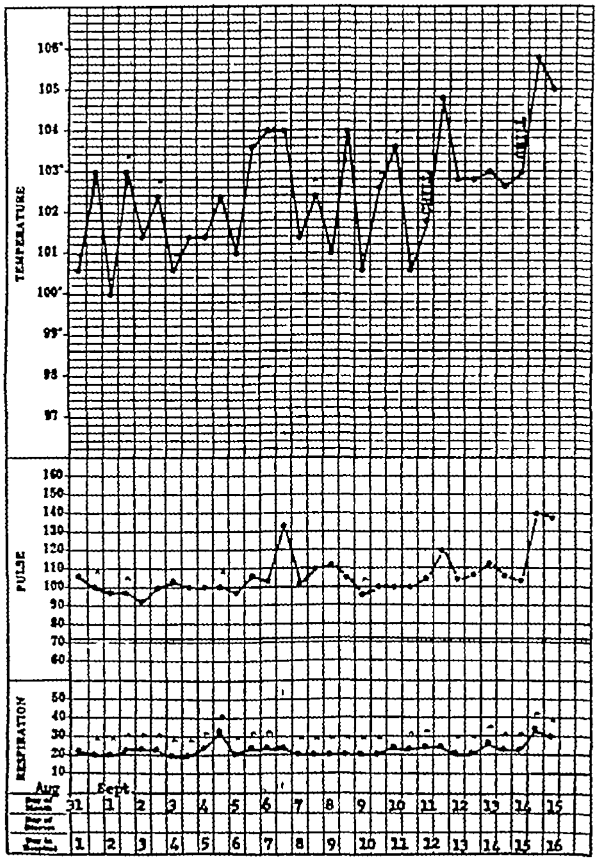

Fig. 1 —Temperature curve showing pronounced fever

On the ninth hospital day the temperature was 101 F., and the patient felt improved A pallor developed and weakness continued That evening the temperature rose to 104 F , dropping the next morning to 100 6 F On the eleventh hospital day the temperature was 103 8 F , and the patient refused to eat He had anorexia but no vomiting. On the twelfth hospital day, the patient had a chill, and temperature rose to 104 8 F The following day the temperature returned to 102.8 F A malarial smear taken was negative for plasmodia On reexamination of the abdomen, the liver and spleen were not tender or palpable The mass remained the same size, was firm and round and had become tender on pressure It was slightly movable There was no distention and normal peristalsis was present. The patient had had a bowel movement daily except on the eighth hospital day A transfusion of 500 cc of whole blood was given Because of the spiking nature of the temperature the possibility of an inflammatory involvement of the mass was considered Surgical consultation indicated a laparotomy essential

On the fourteenth hospital day the temperature remained at 102 8 F The patient was started on streptomycin, 0 25 Gm every six hours He was given 500 cc whole blood and parenteral fluids On the fifteenth hospital day a laprotomy was performed A large tumor infiltrating the mesentery of the small intestine was found A few retroperitoneal nodes were enlarged, the liver and spleen were not enlarged The large mesenteric tumor associated with considerable suppuration, necessitated removal of 31 inches (78 74 cm) of small intestine Immediately postoperatively the patient s temperature was 103 F He was given a transfusion of 500 cc whole blood and parenteral fluids On the evening of the fifteenth hospital day, the temperature began to rise, and the patient had a severe chill The temperature rose to 105 8 F dropping to 105 F on the sixteenth day (fig 1) The patient became cold and clammy, the pulse weak, and he died at 12 45 a m of the sixteenth hospital day An autopsy was not performed

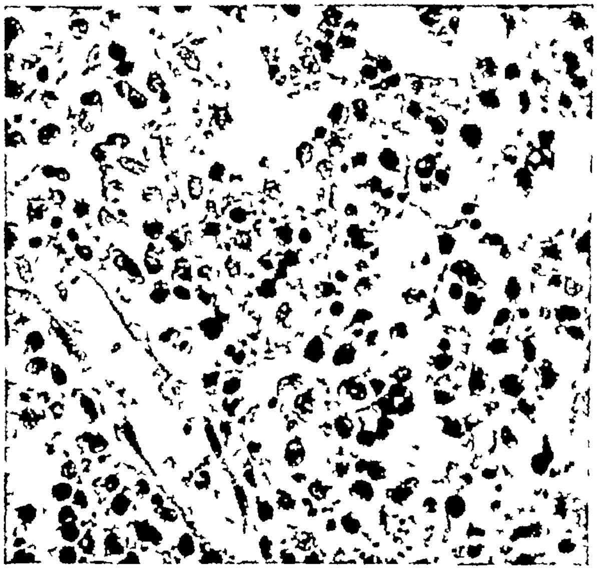

Fig 2 —Photomicrograph of the mesenteric tumor clasmatocytic lymphoma The nuclei exhibit a pronounced degree of variation and are eccentric (× 275)

Gross description was as follows Eighty two cm of small bowel with mesentery attached is 32 mm in average diameter The mesentery is altered by pronounced thickening near the base which averages 3 5 cm *Four other pieces of mesentery received* separately measure from 3 to 12 cm across The thickened portion consists of smooth glistening, grayish white tissue extensively infiltrating and replacing the adipose tissue Localized hemorrhagic nodules about 1 cm across are present in the subserosal portion. Discrete lymph nodes are not present in the mass which has obliterated everything in the periphery of the mass A very occasional fatty and hemorrhagic nodule is observed The resected portion of the bowel has an unaltered wall and a pale intact mucosa having circular folds characteristic of the lower jejunum The lumen contains brownish black material resembling the bowel content of a patient receiving iron medication

Microscopic description revealed the following Sections of the mesenteric lymph nodes are completely replaced by a poorly differentiated tumor composed of cells that are irregular in outline (fig 2) The cells are approximately 14 to 24 μ in diameter The cytoplasm is more abundant than is usually seen in the stem cell type The nuclei are eccentric in position, some being round, oval, or horseshoe-shaped A fine network of chromatin is present The cells are supported on fine reticulum strands Regions of necrosis are common, and growth adjacent to blood vessels is pronounced Infiltration of the nerve trunks is marked on many of the sections

SUMMARY

A case of reticulum cell sarcoma of the mesentery causing pronounced febrile manifestations is presented The tumor was apparently localized to the abdominal lymph nodes, as no generalized involvement was found It is suggested that the mesenteric lymph nodes are the causative site of origin of the tumor in this case

Woodlawn Medical Center (Dr Fein)

IMPROVED ANESTHESIA SCREEN

Frank Cole, M D , Lincoln, Neb

The usual anesthesia screen is almost without exception straight, that is, it consists of three sides of a rectangle This is certainly the simplest and the most stable design, the result is the erection, some 20 in above the operating table, of a rigid bar having the appearance of a straight line The surgeon, who almost invariably places an assistant between himself and the anesthetist, desires that this bar be moved as far cephalad as possible The anesthetist, who is at a loss to understand why even the patient's head must disappear from his view and reach during abdominal surgery, hopes to locate the screen as far caudad as possible The result is that the screen generally is placed directly over the patient's eyes, it is often pushed back after the operation has been started

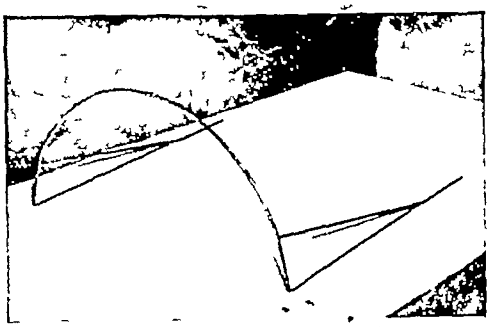

Fig 1 —Semicircular anesthesia screen

It is the surgeon's arm and elbow and those of his assistant that require room at the head of the table, this room is needed only laterally The anesthetist is anxious to be able to see and to reach the patient's head for change of position, suctioning, or tracheal intubation, the space he demands is located toward the midline of the table With these two facts in mind, a new and better shape for the old "ether screen" becomes apparent, one in which the top horizontal bar has the contour, not of a straight line, but of either a curve, such as a semicircle, or two straight lines forming an angle With this newer design, there will be room for the assistant's elbows at the side, while the anesthetist may have exposed for him the patient's entire head

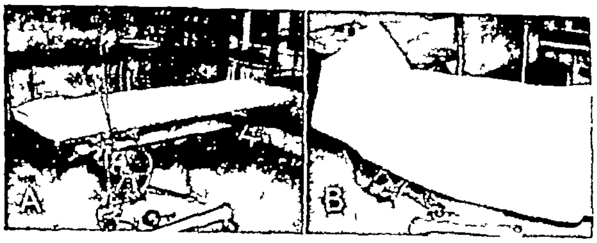

Fig 2 —Improved screen attached to operating table (*A*) and with draping (*B*)

A semicircular screen has been constructed and has proved satisfactory in actual use Draping is no more difficult than with the conventional anesthesia screen The patient's entire head has been accessible to the anesthetist without his being required to reach under the drapes In performance of laryngoscopy, the screen no longer impinges on the handle of the laryngoscope Surgical assistants have been pleased to find as much room for their elbows as they could want

The screen is shown in the accompanying illustrations (figs 1, 2, and 3) It is obviously adjustable to any desired height, can be moved cephalad or caudad, and can be rotated as easily as the conventional screen (fig 3*A*) It affords the assistant a greater degree of comfort, in that the corner no longer impinges on his arm Since the new screen faces him in every position, it is no longer possible or necessary for the assistant to contaminate himself by having his elbow, upper arm, or shoulder behind the sterile screen while holding a retractor

Fig 3 —Anesthesia screen during operation.

ARM REST FOR THE SURGICAL ASSISTANT

Frank Cole, M D , Lincoln, Neb

The surgical assistant's practice of resting his forearm on the patient's chest has long been a source of contention between him and the anesthetist It is not denied that he does want some means of support, it is indeed wearying to hold one's hand in a single position without rest for hours, particularly while holding a retractor On the other hand, the anesthetist's objection is not without justification The fact that the assistant's task is tiring does not warrant his transferring his burden to the patient, whose chest cannot be looked on as an inert and insensitive object I have heard more than one patient under spinal anesthesia complain of the weight of the assistant's arm Surely it requires a considerable effort for a patient, conscious or unconscious, to lift an assistant's forearm with each inspiration In addition, heavy drapes, numerous instruments, and even the patient's own stomach have been found resting on his chest All this must necessarily be reflected in his respiratory and circulatory patterns and often denies him a good anesthesia

The weight imposed on the defenseless patient, which he is thus required to lift about 24 times each minute, was estimated by weighing my own forearm under simulated operating room conditions and was found to be 5 lb My hand, as nearly as I could judge, weighed 3 lb , and my hand and wrist weighed 3½ lb When the hand resting on the patient's chest is at the same time pulling on a retractor, the force the patient is required to overcome during inhalation may be considerably more than this

Lifting five pounds a vertical distance of one-half inch 24 times a minute amounts to a work output of 300 foot pounds per hour, a tremendous load to be inflicted on the respiratory muscles of an unconscious patient, in whom the effect is not merely fatigue but dyspnea During the course of a major surgical procedure, this may amount to an energy expenditure of more than 1,000 foot pounds For two tired assistants one on either side of the table, these figures must of course be doubled All this may easily be regarded as a form of respiratory obstruction

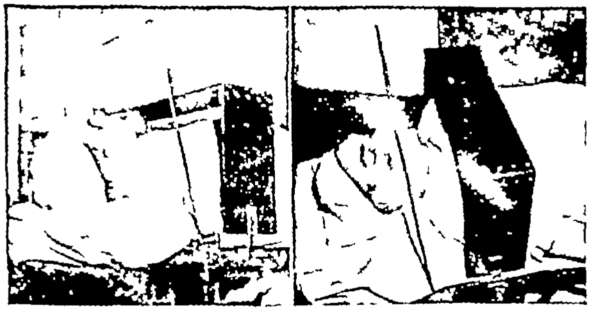

Fig 1—Photographs showing arm rest for surgical assistant.

I have constructed a device that will provide a rest for the assistant's arm and will allow the patient to breathe effortlessly (figs 1 and 2) In addition, it may be used as a second instrument tray The device has proved satisfactory in actual use It has always been possible to obtain free space between the patient's chest in maximal inspiration and the arm rest draping has not been more difficult All surgical assistants who have tried it have been delighted with it The device has been built in two forms Both are easily adjustable to any height and to any position between the patient's shoulders and abdomen

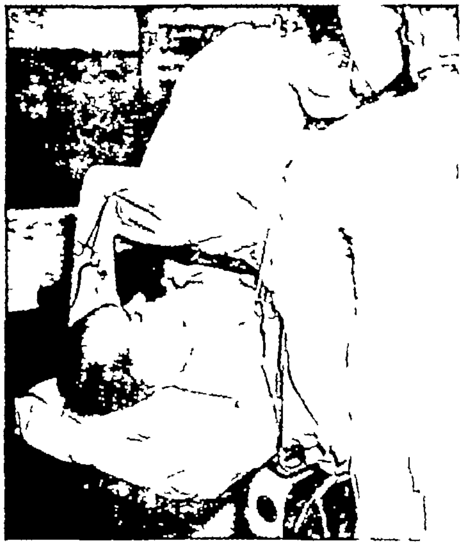

Fig 2.—Photograph of arm rest in operating room

Shortcoming in the Hospital Routine.—Generally speaking, the thing most desired by the newly puerperal woman is rest Indeed, unless there have been complications this is likely to be her greatest need Yet what does she get? She may obtain a good night's rest with the many benefits resulting from refreshing sleep, but then again she may not Frequently those who cannot afford a private room—and they are in the majority—are returned to a ward or semiprivate area where others are in the process of rising Sleep and rest therefore even with the aid of sedation, is brief and fitful There is no prolonged refreshing slumber, nor is there likely to be for whether the patient is in a ward or private room, her presence in a hospital today appears to be a matter of secondary importance Secondary to obsolete but fixed hospital routine, secondary to the schedules of ward helpers orderlies nurses and doctors At some absurd hour she is awakened The technic used for this cruel procedure will, of course, vary It may be a thermometer inserted into her mouth a pitcher of ice water placed on her table or instructions to get washed and ready for breakfast, which commonly arrives an hour or two later Any attempt to snatch a brief rest during the remainder of the day is likely to be interrupted by the vips very important people such as her baby the cleaning woman the nurse the doctor and others I do not mean to be facetious in thus commenting upon the difficulty of obtaining rest in a hospital I seriously believe this has become one of the most important and not too well recognized bugaboo of hospital life I believe it is an important factor in contributing to the emotional upset and tears so frequently noted amongst puerperal women Too often it marks the beginning of the well recognized fatigue syndrome so commonly observed in new mothers — Norman F Miller Shortcomings in Puerperal Care *The Journal of the Iowa State Medical Society* July 1951

MYASTHENIA GRAVIS IN A MOTHER AND HER NEWBORN SON

George E McKeever, M D , Detroit

Myasthenia gravis is a disease that lends itself well to study The history and physical findings are well defined, although variable Almost absolute proof of the diagnosis is available in the test dose of neostigmine (prostigmin®) As a result, many articles are to be found in the recent literature Numerous series of cases have been available for the study of such particular manifestations of the disease as the ocular and the bulbar Certain aspects, however, are sufficiently rare to warrant case reports Among these are cases of myasthenia gravis complicating pregnancy and congenital myasthenia gravis Of the latter, a total of 10 cases has been reported, the first in 1942 [1a] Of the 10 cases, the congenital nature of the disease was determined by retrospect in four In the other six cases the diagnosis was made in the neonatal period In this report the seventh known case of myasthenia gravis occurring in a newborn child of a myasthenic mother is described

REPORT OF CASES

Case 1 —The mother Mrs L. B a 32-year-old Negro graduate nurse entered Harper Hospital Dec 11, 1949 complaining of weakness and weight loss associated with pregnancy The patient had been well until August 1948, when she noticed that she was unable to squeeze clothespins when hanging up clothes In November 1948, she observed that she could not fasten the buttons on her nursing uniform or tie her shoestrings The disability was intermittent and variable from day to day She could not manipulate her fingers in the morning when coming on duty, but after being on duty and busy she had no difficulty She was unable to carve meat because of 'stiffness of the fingers In January, 1949 the patient was, for the first time, unable to raise her hands to comb her hair Early in March, 1949, she experienced weakness of the right leg while attempting to board a bus, it was of such severity that she was unable to climb all the steps into the bus She backed off the steps and went to the emergency room of a local hospital where she was seen in the neurosurgical department No diagnosis was made other than a definite weakness of the right leg After this examination the patient developed blurring of vision She was admitted to the above-mentioned hospital on the neurosurgical service After being studied for seven days she was discharged with no definite diagnosis, multiple sclerosis was suspected The patient stated that she was helped by the bed rest She returned to her occupation as a nurse during the first week in April 1949 She was able to work until May, 1949, when the weakness of the right leg and blurring of vision recurred She then consulted a private physician, whom she saw weekly during the months of May and June In the latter part of June, 1949 she consulted her obstetrician because of suspected pregnancy The diagnosis of pregnancy was confirmed The last menstrual period was given as June 15, 1949 She had some nausea and vomiting of pregnancy during June Physical examination was within normal limits except for the presence of multiple large and small uterine myomas The date of confinement was estimated to be Feb 22, 1950, because of the size of the uterus The obstetrician was unaware of the complaint of weakness because it had disappeared She remained at her job until Aug 21, when she resigned because of abdominal pain that caused her to go to bed for one week The cause of the pain is unknown The patient continued to be free from weakness until the third week in November, 1949 the sixth month of pregnancy, when she noticed gradual loss of strength, had difficulty in climbing stairs and ptosis of the left eyelid and diplopia developed She became progressively weaker, with loss of appetite and weight Chewing became difficult No dysphagia was noted. During December the generalized weakness increased until the time of admission, Dec 11, 1949

Past History —The patient was one of seven month premature fraternal twins She had come to Detroit with her family in 1926 from her place of birth, Port Limén Costa Rica She had always been healthy The mother and father were both alive and well The twin brother was well and on active duty with the navy One brother had died at the age of 6 years of pneumonia There was no history of weakness in any member of the family

Physical Examination —The patient was a thin Negro woman appearing lethargic and chronically ill There was slight ptosis of the left upper eyelid The extraocular movements were normal No pallor of the optic disks was noted There was a perforation of the left tympanic membrane, with evidence of chronic otitis media The mouth was normal except for copious amounts of a thick mucoid saliva The patient was unable to swallow or expectorate the saliva which drooled from her open mouth The chest was normal except for evidence of weight loss The lungs were clear to percussion and auscultation The breasts were normal and full The heart was of normal size, rate 90 rhythm regular A faint systolic murmur was heard over the pulmonic area Abdominal examination disclosed an enlargement of the uterus compatible with a six and one half month pregnancy Multiple uterine myomas were readily palpable through the abdominal wall The extremities were normal except for evidence of weight loss Neurological examination elicited normal findings in all respects except for generalized weakness and ptosis of the left eyelid The weakness was so severe that she was unable to hold up her head The hand grip was almost imperceptible Inability to swallow was manifested by the copious salivary secretions that had to be wiped away from the tongue frequently The face was masklike and sad The patient was mentally clear

Laboratory Data—The red blood cell count was 3 950,000 per cubic millimeter and the hemoglobin was 10 7 gm or 70% Leukocytes numbered 9,700 per cubic millimeter, of which 80% were neutrophils, and 20% lymphocytes Urinalysis and Kahn s test elicited normal findings Blood type was B Rh negative Fasting blood sugar was 075 gm per 100 cc Nonprotein nitrogen was 21 mg per 100 cc.

Diagnosis—A diagnosis of myasthenia gravis was suggested and the patient was given 1 mg neostigmine methylsulfate intramuscularly Within 15 min there was a spectacular improvement in strength of facial expression and ability to swallow The hand grip was notably stronger There was also an increase in general strength and sense of well being The diagnosis of myasthenia gravis was established

Hospital Course—The patient was started on intramuscular neostigmine methylsulfate, 1 mg before meals supplemented by 15 mg of neostigmine bromide as soon as she was able to swallow in response to the intramuscular neostigmine By Dec. 22, the 12th hospital day she had gone into a spontaneous remission and was subsequently carried on a dose of 15 mg. neostigmine bromide three times daily by mouth There were minor variations in the daily dose The maximum was 5 tablets, and the minimum was 1 tablet Because of anemia and debility, the patient was given multiple blood transfusions. Her appetite, strength, and general condition improved steadily, and she had gained 21 lb (9 5 kg) by the time of delivery

On Feb 19, 1950, loss of muscular strength was noted This was especially severe in the muscles of the jaw, manifested by inability to chew food The relapse persisted for three days On Feb 22 1950, there was an increase in strength and general sense of well being At noon the patient began to have half minute labor pains every three minutes She was transferred to the obstetrical floor, where vaginal examination disclosed an

[1] (a) Strickroot F L Schaeffer R L and Bergo H L Myasthenia Gravis Occurring in an Infant Born of a Myasthenic Mother J A M A 120 1207 (Dec 12) 1942 (b) Wilson A and Stoner H B Myasthenia Gravis A Consideration of Its Causation in a Study of 14 Cases Quart J Med 13 1 1944

occiput posterior position of the fetus A moderate amount of vaginal bleeding had been observed It had been originally planned to deliver the infant from below In view however, of the posterior position of the fetus, the vaginal bleeding, the age of the patient and her primiparity, and the presence of multiple large uterine myomas a decision was made to deliver the baby by Porro cesarean section Under spinal anesthesia, the patient was delivered of a 6-lb 10-oz (3 kg) male infant by Porro cesarean section at 8 30 p m, Feb 22, 1950 The operation was performed without incident The patient's condition remained good until 7 30 a m Feb 23, when the pulse became imperceptible, the blood pressure unobtainable, and perspiration profuse The veins were collapsed A venesection was performed, and the patient was given 1,000 cc whole blood and 2 000 cc of dextrose in water She had been anuric By 1 30 p m she was out of shock During the period of shock, there was no evidence of muscular weakness The patient received only 1 tablet of neostigmine bromide on Feb 23 On Feb 24 she began to have fever up to 100 4 F With this elevation in temperature the patient developed ptosis of the left eyelid and weakness of the jaw muscles She showed no weakness on Feb 25, and was strong until Feb 27 when she developed a chill with fever up to 101 3 F Dysphagia was noted, but no other weakness On March 1 profound generalized weakness developed in the patient which closely resembled that present on admission 12 weeks previously Her total neostigmine intake on March 1 was 120 mg of the bromide and 2 5 mg of the methylsulfate Weakness persisted until March 3, when the temperature became normal She again appeared well and strong, and remained so until discharge March 18, 1950 Neostigmine was stopped after the morning tablet on March 12

Follow up Observations—Since discharge the patient has required neostigmine She was well controlled on 4 tablets of neostigmine bromide daily when last seen on June 20, 1950 On this dose she is able to perform the usual duties of a house wife

The outstanding features of the case of myasthenia gravis in the mother are the following (1) the unusual initial symptomatology of the patient had allowed the disease to go undetected for 16 months, (2) the patient experienced a remission during the first five months of pregnancy, (3) a relapse occurred during the sixth month of pregnancy, (4) a remission occurred on the day of delivery, (5) a relapse followed the delivery, and in turn was followed by a remission, (6) the baby was delivered by cesarean section for reasons not related to the myasthenia gravis

Case 2—The infant at birth was normal, with a vigorous cry Signs of myasthenia were particularly sought for because of previously reported cases On Feb 23 twenty two hours after birth, the baby was observed to have a weak cry and masklike facies He did not use the facial muscles to any extent when crying He was generally inactive and nursed poorly, part of the formula being regurgitated through the nose No improvement occurred during the next two days Accordingly on Feb 25 at 2 p m the baby was given 1 mg neostigmine bromide in water by mouth Part of the mixture was regurgitated After 20 min the baby was again appraised The cry was more vigorous, and more facial expression was used in crying He nursed better than during previous feedings The test was interpreted as being suggestive but not diagnostic The baby was given 1 mg of neostigmine bromide by mouth one-half hour before each feeding While on this regimen, he did well

On Feb 26 the neostigmine was discontinued after the 9 45 a m dose The baby did well until 2 a m Feb 27, when marked weakness was noted, the face was again sad and masklike the sucking power poor, and the cry feeble and expressionless At 9 30 a m the baby was given 2 5 mg neostigmine bromide in water by mouth Within 25 min there was a dramatic change in the facies The face had a more intelligent appearance The cry was vigorous and sustained, reaching a higher pitch than had been previously attained There was an increase in general activity Feeding was taken easily The succeeding three feedings were taken well without further neostigmine

At 11 45 p m Feb 27, 14 hr after the last dose of neostigmine, the infant was again found to be lethargic, with a weak and shallow cry The face was apathetic, expressionless and drooped Arms and legs moved only occasionally Vigorous stimulation produced a minimal response Two milligrams of neostigmine bromide in water was given by mouth Within 20 min there had been a progressive increase in activity, which included raising of the eyebrows, increase in the width of the palpebral fissures, and active, continued movement of the arms and legs The face became expressive and intelligent The lips were formed, and the cry was decidedly more vigorous He took 2 fluid ounces (60 cc) of formula with vigor and even collapsed the nipple The change provoked by neostigmine was dramatic A diagnosis of myasthenia gravis was made

The baby was given 1 mg of neostigmine bromide in water 15 min before each feeding In the days that followed, the facial appearance was strikingly more expressive than before neostigmine was started On March 3 the neostigmine dosage was reduced to 1 mg before every other feeding On March 8 at the age of 15 days, neostigmine was discontinued The baby remained well No further weakness had been observed The baby was well when last seen at age 4 mo

The outstanding features of the case of myasthenia gravis in the baby are the following (1) the baby was normal at birth, (2) the symptoms of myasthenia developed gradually from birth so that they were clearly recognized by the second day of life, (3) the diagnosis was easily proved by oral administration of neostigmine bromide, (4) the baby required no neostigmine after 15 days of life

COMMENT

The course of the mother's disease during her pregnancy does not coincide exactly with any single previously reported case of myasthenia gravis complicated by pregnancy This is in keeping with the nature of the disease, its course is unpredictable This is especially true during pregnancy It is the consensus of other authors that the management of pregnancy and labor in cases of myasthenia gravis should be governed by the same principles as govern nonmyasthenic cases It was suggested by Adam that purely obstetrical complications would occur from time to time that would demand cesarean section[2] The case described above presented such complications

The case of the baby is the seventh case of myasthenia gravis recognized in the neonatal period The clinical pictures presented by the seven cases are strikingly similar All seven infants were born of myasthenic mothers The symptoms were manifest in all by the third day of life Two of the babies died[1] The diagnosis was confirmed in five cases by response to neostigmine One infant was well in five weeks[1] In the case presented and one other[3] the patients were well at the end of two weeks A fourth was well at the end of four months but still taking neostigmine[4] The need for continued neostigmine in this case was not proved An infant observed by Ford, cited by Levin,[5a] was well at the end of one week

[4] laBranche H G and Jefferson R N Congenital Myasthenia Gravis, J [illegible]

Four cases of congenital myasthenia gravis have been described in the literature,[5] the congenital nature being determined in retrospect The parents of these infants were not myasthenic These cases seem to fit more closely the classical picture of myasthenia gravis as it is seen in the adult

Levin suggests that the term "neonatal myasthenia gravis" be used to describe the transient asthenia seen occasionally in newborn babies of myasthenic mothers [5a] The term "congenital myasthenia gravis" would be reserved for the persistent form of the disease The distinctive terminology would seem warranted in view of the two distinct clinical courses

The transient nature of myasthenia in neonatal cases should not cause the clinician to consider the problem lightly The two deaths reported in this group speak for the seriousness of the disease, in spite of its brief duration

The cause of myasthenia gravis is unknown It is known that acetylcholine is an essential agent for the transmission of nerve impulses across the synapses This agent is normally hydrolyzed by cholinesterase In myasthenia gravis there exists an excess of cholinesterase with a resulting deficiency of acetylcholine action Neostigmine acts by temporarily inactivating cholinesterase The mechanism of the transient myasthenia in the case of the baby described and others is a matter of conjecture It is certainly related to the mother's illness It could be postulated that there exists an increase of cholinesterase in the infant This could be a reflection of an increased circulating cholinesterase in the mother There is a possibility that an increase in circulating cholinesterase developed in the baby in response to the neostigmine medication administered to the mother The latter possibility seems more likely, since the baby was well at birth and the symptoms of myasthenia developed in progressive severity several hours after birth If the increased cholinesterase of the baby were only a reflection of the increased cholinesterase of the mother, it would be expected that the myasthenia would be severest at birth and show progressive improvement No case of myasthenia gravis in infancy had been observed prior to the introduction of neostigmine (prostigmin®) in 1935

Blood Cholesterol in Thyroid Disorders—Blood cholesterol determinations are of great value in the diagnosis of hypothyroidism, since the range of upward increase in blood cholesterol in hypothyroidism is so wide, up to 800 to 1 000 mg per 100 cc Not only is blood cholesterol determination of value in the diagnosis of hypothyroidism, but it is of equal value in checking minus metabolic rates as an indication of the degree of myxedema or hypothyroidism which is present On the other hand, the downward range of blood cholesterol from normal (160 to 225 mg per 100 cc) is of such limited extent in patients with hyperthyroidism that it has little value in corroborating the clinical diagnosis of the latter —Frank H Lahey, M D, Progress in the Diagnosis and Treatment of *Hyperthyroidism, The Surgical Clinics of North America* June, 1951

COUNCIL ON PHARMACY AND CHEMISTRY

REPORT OF THE COUNCIL

The Council has authorized publication of the following report

R T Stormont, M D, *Secretary*

PYRIDOXINE HYDROCHLORIDE (VITAMIN B_6)

A STATUS REPORT

Synthesis of vitamin B_6 was accomplished in *1939* [1] and the pure substance available as pyridoxine hydrochloride has been used extensively since that time in clinical trials and in studies of its function in the metabolic processes of animals and bacteria The vitamin occurs in animal tissues and in other natural source materials, as the compounds pyridoxine, pyridoxal, and pyridoxamine The term vitamin B_6" can include any of the *three compounds It has been established* [2] that pyridoxal phosphate is the coenzyme for transaminase and tyrosine decarboxylase enzymes that are involved in the interconversion of amino acids and hydroxy acids Thus the function of vitamin B_6 is related primarily to the metabolism of proteins

It has been shown that the vitamin is required in the nutrition of all species of animals studied thus far, including the rat, mouse, dog, monkey, chicken, pig, and calf The vitamin is essential for growth of the young and protracted deficiency results in acrodynia, edema, muscular weakness,[3] and convulsive seizures of an epileptoid type [4] Microcytic anemia has been observed in dogs [5] fed a pyridoxine-deficient diet, and characteristic neurologic changes in addition to the characteristic anemia have been described in the pig.[6] A recent report [7] describes arteriosclerotic lesions in the monkey after 5½ to 16 months on a pyridoxine deficient diet. Characteristic excretion of xanthurenic acid, an intermediary metabolite of tryptophane metabolism, indicating a deranged protein metabolism, has been noted by several workers [8] Although quantitative requirements of animals are not well established, it has been shown that the amount needed by the mouse is dependent to some extent on the protein level of the diet [9] and that the pyridoxine requirements of the rat,[10] dog,[11] mouse,[12] and chick [13] fall in the same general range as those for *thiamine*

In light of the importance of vitamin B_6 in animal nutrition, as demonstrated by these and other reports clinicians have attempted to discover its importance as a nutrient for man

Soon after the vitamin became available for parenteral administration, Spies, Bean, and Ashe [14] reported that four undernourished patients exhibiting extreme nervousness, insomnia, irritability, abdominal pain, weakness, and difficulty in walking despite treatment with thiamine riboflavin and niacin, responded dramatically to administration of vitamin B_6.

A year later Spies, Ladisch, and Bean [15] determined vitamin B_6 excretion after a test dose of 50 mg in normal males and in ambulatory patients described as B-complex deficient During the first hour after administration, 8% to 10% of the test dose was excreted by the normal subjects and less than 1% by those diagnosed as having a B-complex deficiency

These observations of Spies and his group led others to study the effects of this vitamin in a number of clinical conditions Antopol and Schotland [16] reported improvement in six patients suffering from pseudohypertrophic muscular dystrophy Changes in such cases are difficult to evaluate, however and report of improvement was based largely upon subjective findings Ferrebee and co workers [17] reported negative results in 20 cases of *muscular dystrophy treated* with vitamins E and B_6

Later Rosenbaum, Portis, and Soskin [18] reported relief from extreme muscular weakness associated with neurasthenia one to 14 days following administration of 50 mg doses of vitamin B_6 in two patients No response was noted in a patient with myasthenia gravis

Eaton, Woltman, and Butt [19] concluded from a clinical trial that pyridoxine was of no benefit in amyotrophic lateral sclerosis, progressive muscular atrophy, or progressive muscular dystrophy

In three separate clinical studies efforts to relieve the symptoms of paralysis agitans with either intravenous or oral administration of pyridoxine resulted in failure Barker Stein Miller, and Wintrobe [20] used intravenous injections of 100 mg per day over a two week period in seven patients with obvious manifestations of Parkinsonism In no case was the slightest evidence of improvement obtained Zeligs [21] found no beneficial effects whatever in 15 similar patients after repeated injection of 50 to 100 mg doses of the vitamin Baker [22] studied 19 cases of paralysis agitans treated with 100 mg doses of vitamin B_6 by injection, or with daily oral doses of 50 mg Results of oral medication were suggestive but as a whole the study furnished no basis for concluding that the vitamin is of any value in treatment of this syndrome Meller [23] studied four cases of postencephalitic and 6 cases of idiopathic paralysis agitans given 50 mg of B_6 subcutaneously or intramuscularly daily for 10 days, 100 mg daily for three or four days and further treatment depending on response for periods of 19 days to five months As a result he agreed with other investigators that postencephalitic cases fail to respond to B_6 therapy In the idiopathic form of the disease, decreased pain and rigidity and increased sense of well-being were observed, a result Meller considered significant in a disease of this chronicity

Results of the use of pyridoxine in dermatology are not conclusive Wright Samitz, and Brown [24] reported a two-year therapeutic trial of the vitamin in treatment of various dermatoses Improvement was noted in several cases of seborrheic or seborrhoid eruptions, but the study did not include control cases and the possibility of spontaneous improvement could not be eliminated Pyridoxine deficiency as determined by measure of urine excretion of pyridoxine was not a reliable index of the patient s response to pyridoxine therapy Jolliffe Rosenblum and Sawhill [25] studied the effect of pyridoxine in treatment of adolescent acne Although this condition apparently is subject to spontaneous change and seasonal variation these workers were led to conclude that daily oral doses of 50 to 250 mg of the vitamin resulted in improvement in the skin lesions More than 80 patients were observed in the trial

Following the observation of Chick and co-workers [26] that epileptiform seizures occurred in pigs maintained on a vitamin B_6 deficient ration Fox and Tullidge [27] studied pyridoxine effects in human epilepsy Eight boys 14 to 15 years of age with varying degrees of petit mal and occasional grand mal seizures, were selected for study because their fits occurred regularly After treatment with 20 to 100 mg of pyridoxine daily for four to eight weeks no evidence of increase or decrease of seizures or any other mental or physical change was noted

In attempts to improve the Army Motion Sickness Preventive which consisted of sodium amytal, atropine, and scopolamine, Smith [28] found that thiamine and pyridoxine alone or in combination were of no demonstrable value

A number of attempts have been made to determine the value of pyridoxine in preventing or speeding recovery from the nausea and vomiting that occur frequently after large doses of roentgen radiation As early as 1943 Maxfield, McIlwain, and Robertson [29] reported favorable response in more than 50 patients treated by injection of 25 mg of pyridoxine at the onset of radiation sickness and then by similar doses daily until relief was obtained Although enthusiastic about the effect of pyridoxine the authors believed that it should not preclude other medication as needed In a study of 24 cases Shorvon [30] obtained gratifying results in 22 patients He observed that oral doses of 50 mg daily, or two parenteral doses of 50 mg weekly resulted in comparable responses

Wells and Popp [31] noted favorable responses when 200 mg of pyridoxine was injected one half hour before roentgen treatment In 200 cases response was excellent or good in two thirds and fair or poor in one third Maximum benefit was noted with injection of 200 mg but not with 50 mg or less The lack of response from placebo treatment was convincing

Following the early enthusiastic report by Willis and co-workers [32] of the success of pyridoxine in the treatment of 38 cases of nausea and vomiting of pregnancy Weinstein Mitchell and Sustendal [33] obtained similar results The latter authors

administered an initial dose of 50 to 100 mg, followed by doses of similar size three times weekly until nausea subsided Response was most notable in that group of patients in which symptoms were of such severity that hospitalization would ordinarily have been required These authors concluded that while pyridoxine is of great value, the importance of sedative and diet instructions should not be overlooked A later report from the same clinic [34] recorded further experience in which the majority of 78 pregnant women treated with pyridoxine responded favorably The milder attacks of nausea and vomiting were treated with oral doses of 60 to 80 mg of pyridoxine daily, while the more severe were treated with intravenous doses of 100 mg daily for a few days, then with daily oral doses of 80 mg Similar experience has been reported by Silbernagel and Burt [35]

Failure of pyridoxine in treatment of nausea and vomiting of pregnancy was described by Hesseltine [36] who stated that in his experience hyperemesis gravidarum occurs very infrequently, and that less serious nausea and vomiting, although more common, is difficult to evaluate From results of a controlled study of 16 cases with varying degrees of nausea and vomiting in which 100 mg of pyridoxine hypodermically or placebo treatment was given daily, Hesseltine concluded that the use of pyridoxine for hyperemesis gravidarum as advocated in the literature is valueless and without justification

Clinicians who have reported beneficial results with pyridoxine in treatment of nausea and vomiting of pregnancy have been aware that use of the vitamin was empirical and have been cautious in claiming therapeutic effectiveness A biochemical basis for such effectiveness has been provided, however, in the recent report by McGanity, McHenry, Van Wyck, and Watt [37] In an earlier study by this group [38] it was demonstrated by changes in blood urea values that pyridoxine depleted rats and dogs differed from normal animals in ability to metabolize protein Following this experiment, blood urea levels were determined in normal non pregnant women, normal pregnant women, and in 17 pregnant women in the first trimester with nausea and vomiting of a severity classed as hyperemesis gravidarum The fasting blood urea level was found significantly lower in normal pregnant than non pregnant subjects It was even lower in patients with hyperemesis gravidarum than in normal pregnant women, but was restored to normal pregnancy value after the administration of pyridoxine The response to a test load of an amino acid was studied in the same group of women Blood urea increased to a maximum six hours after oral administration of 30 mg of DL alanine, returning to original values within 12 hours in the non-pregnant and normal pregnant women In women with hyperemesis gravidarum blood urea levels rose but failed to decrease significantly between the sixth and the twelfth hours, thus exhibiting a flat curve Supportive therapy alone for 72 hours did not alter response to DL-alanine, but supportive therapy supplemented with 120 mg of pyridoxine produced normal pregnancy response to the test

It is difficult to say whether these observations indicate that the biochemical defect in hyperemesis gravidarum is a pyridoxine insufficiency or a defective protein metabolism leading to excessive excretion of amino acids that are effectively deaminated in the presence of additional amounts of pyridoxine

From the work of Umbreit and Gunsalus [39] it is clear that pyridoxine is transformed in the body to pyridoxal and pyridoxamine, and that pyridoxal phosphate is the co-enzyme for the systems essential for the decarboxylation and transamination reactions in amino acid metabolism The exact position of the phosphate in the pyridoxal molecule has not been determined

A number of workers have been concerned with the need for pyridoxine in human nutrition and it appears now to be well established that in man this vitamin has a specific function Suggestive evidence was furnished by Hawkins and Barsky [40] who observed mild changes in the blood white cell picture in a male subject maintained on a pyridoxine-deficient diet for 56 days Greenberg and co-workers [41] observed in two human subjects, on a pyridoxine-deficient diet for an extended period, that excretion of xanthurenic acid was greatly increased after a test dose of tryptophane This xanthurenic acid excretion was reduced following the administration of pyridoxine The relation of the excretion to xanthurenic acid, a product of tryptophane metabolism, to pyridoxine requirement was first observed by Lepkovsky, Roboz, and Haagen-Smith,[42] who isolated the compound from the urine of rats on a pyridoxine-deficient diet A recent report from Mueller and Vilter,[43] in which they describe symptoms of pyridoxine deficiency resulting from the ingestion of the pyridoxine analog desoxypyridoxine, further supports the conclusion that there is a human need for this vitamin, as indicated by the following excerpt

"Eight patients suffering from various chronic illnesses were given 60-150 mg of desoxypyridoxine intramuscularly daily while they were maintained on a diet low in vitamins of the B complex Hematologic studies were done before and at biweekly intervals after the institution of the experimental regime Urine assays for pyridoxic acid, thiamin, riboflavin, and N^1 methyl nicotinamide were done at weekly intervals in most instances When the deficiency state developed, the patient was placed on a vitamin B complex mixture devoid of pyridoxine and later on pyridoxine alone The desoxypyridoxine and diet were continued throughout the entire experimental period

"Seborrhea-like skin lesions developed about the eyes, nose, and mouth within two to three weeks in seven of the eight patients In three of the seven the lesions were quite severe Half of the patients developed erosions in and around the mouth resembling cheilosis of riboflavin deficiency and glossitis resembling morphologically that seen in niacin deficiency One patient developed severe systemic symptoms A mild but definite lymphocytopenia appeared in seven of the eight patients No anemia occurred These manifestations were unchanged when the vitamin B complex mixture devoid of pyridoxine was given but responded in 48 to 72 hours of the parenteral administration of 100 to 200 mg of pyridoxine "

It is the authors' opinion that the lesions described are specific for pyridoxine deprivation and constitute at least a part of the human syndrome of this deficiency

A specific demonstration of the need for pyridoxine in human nutrition is found in the report of Snyderman, Carretero, and Holt [44] Their summary of their results is stated as follows

"A pyridoxine deficient diet, given for therapeutic reasons to two mentally defective infants for 76 and 130 days respectively, failed to produce clinical benefit but yielded information of nutritional interest Both subjects developed evidences of pyridoxine deficiency, indicating that pyridoxine is a human dietary essential The first change noted was the prompt disappearance of pyridoxic acid from the urine and a reduction of the total urinary pyridoxine to low values ranging from 0 2 to 2 mg per day Subsequently, both infants lost the ability to convert tryptophane to nicotinic acid, an effect which was desired in order to block a metabolic path for tryptophane that might be competing with normal tissue synthesis A plateauing of the weight curve occurred 33 and 73 days after the institution of the regime On the 76th day one subject developed a series of convulsions which were promptly relieved by the administra tion of pyridoxine The other subject developed a hypochromic anemia at approximately the 130th day This responded dramatically to pyridoxine, a rise in reticulocytes was noted after 72 hours reaching a peak in four days after which red cell count and hemoglobin rose to normal Both subjects gained weight normally after supplementation In marked contrast to the excellent and prompt clinical response to the administration of pyridoxine was a delay in the reappearance of the ability to convert tryptophane to nicotinic acid "

Corticotropin.—Acthar (Armour) —

Actions and Uses —The adrenocorticotropic hormone of the anterior pituitary gland stimulates the adrenal cortex to secrete its entire spectrum of hormones Hormonal effect can be exerted only if a functioning adrenal cortex is present Corticotropin is rapidly utilized in the body, its effect rarely exceeds six hours This necessitates repeated administration of the drug The physiologic and metabolic effects of the hormone are due to the adrenal corticosteroids elaborated and are, in general, similar to those described for cortisone acetate Because of its rapid absorption and utilization these effects appear more promptly than with parenteral or oral administration of cortisone acetate The prompt fall of the circulating eosinophil count when therapeutic doses of corticotropin are given is the basis for the Thorn test of adrenocortical response The drug is of value in the same disease conditions for which cortisone acetate is used except that it is not effective for the treatment of Addison s disease

In general, long term administration of either corticotropin or cortisone acetate induces similar undesired hormonal effects However, hypertension and virilism are more likely with the use of corticotropin, while cortisone acetate may elicit involution or partial atrophy of the adrenal cortex A period of depressed adrenocortical function follows sudden cessation of corticotropin administration, but may be avoided by gradual reduction both of the dosage and the number of doses given

The potent metabolic effects of corticotropin require frequent check on the patient s weight blood pressure, and electrolyte balance A high potassium, low sodium intake is advisable if protracted treatment or a large dose of corticotropin is necessary

Corticotropin is contraindicated for long term treatment in hypertension, diabetes mellitus mental disturbances chronic nephritis, congestive heart failure, Cushing s syndrome, and hirsutism It has been reported that allergic sensitivity to corticotropin may develop in a small percentage of patients, the reactions have varied from anaphylactoid shock to giant urticaria

Dosage —The average adult dose of corticotropin is 40 to 50 provisional U S P units daily, administered parenterally in four divided doses If the desired clinical effect is not obtained, the dosage may be cautiously and gradually increased to a total of 100 provisional U S P units daily Maintenance dosage should be at the lowest level required to continue clinical improvement

Tests and Standards —Corticotropin is assayed biologically by the measurement of the adrenal ascorbic acid response in hypophysectomized rats. An International Standard has been established by the World Health Organization The provisional U.S P unit is identical with the International unit. Each is defined as representing the specific adrenocorticotropic activity of 1 mg of the International Standard

Lyophilized Acthar (Pork) Vials containing the equivalent of 10 15, 25 and 40 provisional U S P units The Armour Laboratories Chicago

Sodium Ascorbate Injection U.S P (See New and Nonofficial Remedies 1951, p 432)

Solution Sodium Ascorbate 2 cc ampuls A solution containing sodium ascorbate equivalent to 50 mg of ascorbic acid in each cubic centimeter Stabilized with 0 1 per cent sodium bisulfite and 0 1 per cent cysteine hydrochloride Meyer Chemical Company, Detroit

Solution Sodium Ascorbate 2 cc and 5 cc ampuls A solution containing sodium ascorbate equivalent to 0 1 gm of ascorbic acid in each cubic centimeter Stabilized with 0 1 per cent cysteine hydrochloride Meyer Chemical Company Detroit

Progesterone-U.S P (See New and Nonofficial Remedies 1951 p 361)

Solution Progesterone in Oil with Benzyl Alcohol 2% 10 cc vials A solution in sesame oil containing 25 mg of progesterone in each cubic centimeter Preserved with 0 004% phenylmercuric benzoate Biophysics Laboratories, Inc , Los Angeles

Solution Progesterone in Oil 10 cc vials A solution in peanut oil containing 10 mg or 25 mg of progesterone in each cubic centimeter Preserved with 0 5 per cent chlorobutanol Carlo Erba, Inc , New York

Tetanus Toxoid, Alum Precipitated U.S P (See New and Nonofficial Remedies 1951, p 383)

Tetanus Toxoid (Alum Precipitated) 5 cc vials (five immunizations) Preserved with thimerosal 1 10 000 Pitman-Moore Company, Division of Allied Laboratories, Inc , Indianapolis

Tetanus Toxoid Alum Precipitated 2 cc vials (one immunization) and 10 cc vials (five immunizations) Preserved with thimerosal 1 10 000 E R Squibb & Sons, New York

Tyrothricin U.S P (See New and Nonofficial Remedies 1951, p 44)

Solution Tyrothricin 2% 50 cc vials A 92% alcohol solution containing 20 mg of tyrothricin in each cubic centimeter Parke, Davis & Company, Detroit

Tetanus Toxoid U.S P (See New and Nonofficial Remedies 1951, p 382)

Tetanus Toxoid Fluid 1 cc vials, for supplementary immunizations Preserved with thimerosal 1 10,000 E R Squibb & Sons, New York

ACTH NOMENCLATURE AND STANDARDIZATION

The pituitary adrenocorticotropic hormone (ACTH) was originally given the generic designation of corticotrophin in 1938 by the Third International Conference on the Standardization of Hormones of the League of Nations Recently this name was reconsidered and again approved by the World Health Organization's Subcommittee on Non-Proprietary Names of the Expert Committee on the International Pharmacopeia The adoption of the "-trophin" suffix posed a problem because the "-tropin" ending is generally used in the United States to describe activity directed toward stimulating a specific organ Both suffixes are derived from the Greek "-trophos" referring to nutrition, "-tropos," to a turn After considerable deliberation, the Council on Pharmacy and Chemistry has decided to utilize the generic designation of corticotropin for the description of the hormone in New and Nonofficial Remedies This generic name is not only more consonant with local usage but also more descriptive of the actual hormonal effect which is turned toward the adrenal cortex This pituitary principle does not provide nutrition for the adrenal cortex

The variation in nomenclature between the World Health Organization's and the Council on Pharmacy and Chemistry's generic designation for corticotropin is minor and should not cause confusion In fact, the World Health Organization recognizes that minor differences in spelling may occur because of language variation and national usage

Of more serious nature, however, has been the problem of standardization of corticotropin Originally, the dosage of the hormone had been expressed in milligrams, and many physicians undoubtedly believed that the weight statement on the label represented the weight contents of the vial Since corticotropin is not a pure active principle or chemical entity, but varies in potency with each lot prepared, it had been standardized by comparing the biologic activity of each new batch extracted with an arbitrarily selected house reference standard of corticotropin, utilizing the assay method suggested by Sayers, Sayers, and Woodbury Label designations of 20 mg thus did not mean that the vial contained 20 mg of substance but rather that the content of the vial had the same potency by biologic assay as 20 mg of the house reference standard This procedure of standardization is customary for comparing an unknown sample of a biologic principle of variable potency with an arbitrary unit in order to have some uniformity of clinical response

Subsequently, the World Health Organization's Expert Committee on Biological Standardization adopted the house standard of the original manufacturer as the international standard The International Unit for corticotropin was defined by the same body as "the specific ACTH activity of one milligram of the International Standard " Although practically the entire supply of this house standard was generously sent to the offices of the World Health Organization, the quantity was extremely limited for world use The International Reference Standard of corticotropin, necessary for comparative assays and establishment of manufacturers' own reference standards, therefore was furnished in powder form sealed in glass ampuls containing only 1 3 or 4 8 mg. The choice of container was unfortunate, since the powder adhered to the sides of the ampul and could not be entirely shaken free The amount that could be removed was frequently too small for accurate weighing The danger of glass particle contamination also existed Aqueous solutions of the standard could not be utilized because they were unstable and lost potency rapidly These limitations became evident when several other firms introduced their own brands of corticotropin and found themselves unable to establish a house reference standard in terms of the International Standard The Food and Drug Administration, therefore, temporarily required each manufacturer to create his own house standard, assay technics, and unit of potency—the objective being for a unit to be comparable in potency with 1 mg of the first manufacturer's reference standard No clear interrelationship existed between the variously defined and derived house units To complicate the matter further, corticotropin derived from the original modified Li method varied in physical characteristics, stability, and yield of hormone from that obtained by the Astwood technic Nevertheless, each substance produced specific adrenocorticotropic stimulation

At this juncture, the physician was faced with the unsatisfactory situation of utilizing an inconsistently standardized hormone whose potency varied from brand to brand, as attested by animal experimentation and clinical experience On March 22, 1951, at the offices of the Food and Drug Administration in Washington, representatives of the firms, of the U S P Committee of Revision, of the Council on Pharmacy and Chemistry, and of the Food and Drug Administration discussed the problem It was agreed that the most desirable solution would be to set up a provisional U S P reference standard to overcome the shortcomings of the International Reference Standard Although the U S P Committee of Revision does not usually establish standards for drugs which have not been acted on favorably by the U S P Subcommittee on Scope, in this instance it was felt that the U S P organization could render a distinct service to medicine by creating such a provisional reference standard It was also agreed that the provisional U S P unit of corticotropin should be identical with the International Unit and thus represent the specific biologic activity of 1 mg of the International Standard for corticotropin

A supply of corticotropin was obtained from three commercial sources in the United States and pooled and compounded in such a way as to incorporate 0 1 mg of the powder into a 20 mg tablet. The office of the U S P Committee of Revision also had obtained a substantial quantity of the International Standard in powder form and similarly compounded this material into tablets weighing about 20 mg and containing 0 1 mg or 0 1 International Unit In comparative assay as measured by the Sayers or the Sayers-Munson method, it was ascertained that the provisional U S P reference standard contained 0 12 International Units per 20 mg tablet Further studies on improvement of corticotropin assay are now under way by a U S P study panel

It now becomes possible and desirable for all manufacturers to label their products in terms of the provisional U S P unit, thus providing some assurance of uniformity among the various brands of corticotropin Physicians should note that, while corticotropin will then be standardized biologically, the effects in human beings of the various commercial preparations will not be completely comparable, because the assay method does not overcome the known differences between animal and human response Furthermore, all brands of corticotropin are not made by the same process Certain differences among brands are evident, such as stability in solution, solubility in saline solutions, and rate of absorption Clinical experience will have to determine which process of manufacture yields the most desirable product Then, further measures may be taken to eliminate differences in response by agreement on a uniform method of extraction of corticotropin

DA COSTA'S SYNDROME, OR NEUROCIRCULATORY ASTHENIA

The appearance in 1940 of the second edition of Sir Thomas Lewis's "The Soldier's Heart and the Effort Syndrome"[1] focused the attention of physicians once more on one of the most frequent causes of invalidism among soldiers Because the symptoms resembled those of fatigue following effort in normal persons, Lewis suggested the name "effort syndrome" The name "neurocirculatory asthenia" was suggested by a team of medical reserve corps officers of the American Army[2] sent to Colchester, England, to study the condition with Sir Thomas Lewis They felt that the symptoms comprising effort syndrome in normal persons were not the same as those observed in neurocirculatory asthenia Da Costa described its occurrence many years ago in the United States He stressed that the condition was not confined to soldiers, since the symptoms were frequently present before enlistment. Fever, diarrhea, wounds, and strenuous existence of the soldiers were predisposing factors

The more recent contributions by Wood,[3] by Cohen and his co-workers,[4] and by Walker[5] suggest that the basic mechanism of neurocirculatory asthenia has not been elucidated The term "effort syndrome" is incorrect, in the opinion of Wood, because the symptoms of the syndrome are not confined to exertion They may occur at any time during the day or night, and they are invariably provoked by emotion The tendency is to regard it as a functional disorder of the autonomic nervous system of psychogenic origin Given a neuropathic predisposition based on hereditary and constitutional inadequacy, many factors can assume the role of exciting or initiating agents The syndrome is characterized by dyspnea, easy fatigability, palpitation or heart consciousness, fainting, giddiness, headache, sweating, blueness or mottled coloring of the hands, dermatographia, and a variety of neurovascular phenomena The pulse at rest and at sleep is normal but is easily accelerated by emotion or exercise and is abnormally slow in its return to normal after exercise Blood pressure is as a rule normal at rest but exhibits the same exaggerated response to exercise and emotion as does the pulse The electrocardiogram does not reveal any structural changes

Diagnosis of the syndrome presents few difficulties The diagnostic problem involves recognition of possible associated disease, such as pulmonary tuberculosis, exophthalmic goiter, malaria, coronary artery disease, thyrotoxicosis, and chronic infections Wood[3] stresses that patients with Da Costa's syndrome experience a true sensation of breathlessness in circumstances that would not affect a normal person Hurried, irregular, and shallow breathing is common in the more nervous patients, apart from effort, frequent deep sighs occur in many, in a few there is true hyperventilation, usually the result of emotion

Emotional reaction is the essential common factor in this syndrome According to Wood the special feature that distinguishes this group from other psychoneurotic physical patterns is the establishment of a link between the emotional reaction and effort The link was usually forged when emotional symptoms were misinterpreted and the heart blamed, so that fear of effort followed Wood concludes that Da Costa's syndrome, as he would prefer to call it, is an emotional reactive pattern peculiar to psychopathic personalities and to subjects with almost any form of psychoneurosis Walker[5] believes that all the manifestations of the syndrome can be explained as a normal physiologic response to anxiety

The therapeutic problem is to induce the patient to recognize that he is suffering from the effects of emotional disturbance and not from an organic disease Psychotherapy must be directed primarily toward recognition and removal of fears and anxiety In certain instances it may become imperative to alter the environment Occasional use of barbiturates is useful but is never curative Prognosis depends much on early recognition and early psychotherapeutic treatment

LOCAL HEALTH UNITS

Evidence is accumulating that the idea of local public health units is receiving favorable attention in an ever-widening circle This idea is expressed as Point 6 in the 12-point program of the American Medical Association for the advancement of medicine and public health, reading as follows

> *Establishment of local public health units and services and incorporation in health centers and local public health units of such services as communicable disease control, vital statistics, environmental sanitation, control of venereal diseases, maternal and child hygiene and public health laboratory services Remuneration of health officials commensurate with their responsibility*

A recent release by the National Health Council indicates that a number of states are making substantial progress in the establishment and expansion of local health unit services The report also points out that legislation now before the House Interstate and Foreign Commerce Committee providing for federal aid to local public health units is in danger of being by-passed unless Congressmen are made aware of its desirability

Medical service is the core of any local health unit, and the profession, through action of the House of Delegates of the American Medical Association, is formally on record as approving the principle of local health units But, as physicians have learned, mere approval is usually not sufficient to bring about a desired goal With the increased attention that is being given this subject, individual practitioners have a double duty to assist in furtherance of the program Enactment of a federal law facilitating the setting up of local health units will be an important forward step in making available health needs that the profession knows can be provided satisfactorily only at the local level Unless practicing physicians are closely identified with such programs at all stages, they run the risk of being overlooked when the time comes to decide how a given health unit shall function best at the local level

HEREDITARY OBESITY

The production of a hereditarily obese strain of mice has been recently reported by Ingalls and associates[1] Whereas the weights of young adult normal mice are in the range of 16 to 26 gm, the young adult obese mice weigh 38 to 56 gm A study of the nutritional and metabolic abnormalities of these obese animals is currently reported by Mayer[2] and associates of Harvard University and Jackson Memorial Laboratory, Bar Harbor, Maine

Ten obese and seven non-obese mice were placed in individual cages and given a free choice of three diets, each diet consisted of a mixture of fat, carbohydrate, and proteins fortified with minerals and vitamins In one diet 90% of the total calory content was in the form of protein The second diet contained 90% carbohydrates, the third 90% fats They found that obese mice ate on an average five calories more per day than the non-obese controls, sufficient to give a 16 gm increase in body weight by the end of 30 days The obese mice also selected proportionally more fat and less protein and carbohydrate

Since the diet selected by the obese animals was suggestive of the restricted carbohydrate diet often prescribed for diabetic patients, quantitative studies of blood sugar were made It was found that normally fed obese mice had a high blood sugar level, general above 200 mg per 100 cc Non-obese controls had a blood sugar level of the order of 110 mg per 100 cc After a four-hour fast, the blood sugar level of the obese animals fell 50 to 60%, whereas that of the controls underwent no appreciable change

The livers of the obese mice were characterized by a glycogen content far below that of the controls Obese mice also had glycosuria These observations demonstrate the existence of *hereditary diabetes independent* of environmental factors It was further found that obese diabetic *mice are insulin-resistant Even massive doses* fatal to normal mice produced no demonstrable toxic *symptoms and no fall in blood sugar*

LOS ANGELES BECKONS

Those who are planning to attend this year's Clinical Session of the American Medical Association in December have a bonus awaiting them a holiday in sunny California, away from winter's slush and snow, and an opportunity to enjoy the scenic beauty and unsurpassed recreational facilities of Los Angeles The superlatives applied to this city by its Chamber of Commerce are not without foundation Located in the center of picturesque Los Angeles County, the city is within easy reach of colorful orange groves, snow-capped mountain peaks, and coastal beaches Served by seven scheduled airlines and three transcontinental railroads, it is readily accessible to visitors from all parts of the country Its 1,271 hotels have accommodations for every taste and purse, and its numerous specialty restaurants, with their international cuisine, cater to the tastes of the most discriminating gourmet Entertainment is available in variety and abundance Los Angeles has been called the talent capital of the country Hollywood is an integral part of the city, and its movie, radio, and television studios draw thousands of visitors each year, as do the fashionable residential districts and exclusive shopping centers of Beverly Hills Other attractions in Los Angeles include its beautiful homes and public buildings, its ancient Spanish missions, the old Mexican shops of Olvera Street, the exclusive private mansions of Bel Air Park, Griffith Park and its planetarium, and Chinatown Among the fine hospitals of interest to visiting physicians is the 2,452-bed Los Angeles County Hospital, one of the largest and best equipped in the country For the athletically inclined the city boasts year-round golf, tennis, and swimming For those who have a day or two to spare before or after the Session there will be opportunities to visit one of the many nearby beaches or Santa Catalina Island, with its flying fish and submarine gardens Here indeed is an opportunity to mix pleasure with business and to profit from both

MEDICAL NEWS

ALABAMA

Company Presents Hospital to Communities—The Lloyd Noland Hospital in Fairfield has been presented by its owner the Tennessee Coal, Iron and Railroad Company, to the Lloyd Noland Foundation for the benefit primarily of the people of the western sections of Jefferson County Presentation of the hospital and all of its properties equipment, and facilities along with a substantial cash contribution for working funds, was made Aug 29 An additional sum of $75,000 was donated by the company to erect and equip an outpatient clinic buiding to be operated in conjunction with the 300-bed hospital The first four members of the board of trustees were selected by the communities, which include Fairfield, Ensley, and Bessemer The Tennessee Company selected the other three initial trustees of the foundation, the president, treasurer, and comptroller In the legal instrument establishing the trust, provisions were included whereby the people of the principal western communities will select the succeeding trustees The Lloyd Noland Hospital includes wards and semiprivate and private accommodations for both white and Negro patients In addition to clinics for all principal phases of medicine and surgery, it has a modern x ray department, a fully integrated laboratory, operating rooms, laundry, nurse's home, motor vehicles, and other equipment Its grounds embrace about 41 acres The contribution of the hospital by the Tennessee Company to the community and the resultant foundation arrangement will enable the hospital to reach into even greater realms of research, Mr Wiebel, president of the company, said He further stated, It will open up to the hospital means of participating in grants and endowments for medical undertakings heretofore not available to it as a private institution This should result in further advancement of the entire Birmingham community in the field of medical science "

CALIFORNIA

Dr Forsham to Direct Laboratory—Dr Peter H Forsham, Boston, has been appointed director of the Research Laboratory in Arthritis and Allied Diseases at the University of California School of Medicine, San Francisco The arthritis laboratory has been in operation for nearly a year and was established through a legislative grant that called for a joint effort on both the San Francisco and Berkeley campuses Work to find new materials for use against the diseases is being carried on in Berkeley, while a broad clinical application and research program is going ahead at San Francisco The laboratory in San Francisco is housed in temporary quarters pending completion of special facilities Dr Forsham, has been on the staff of the Harvard Medical School and the associated Peter Bent Brigham Hospital, Boston

COLORADO

Fall Postgraduate Conferences—The University of Colorado School of Medicine, Denver, is presenting the following postgraduate courses (1) Conference on Chest Diseases, Oct 18-20, co-sponsored by the Colorado Trudeau Society and the American College of Chest Physicians (2) Heart Disease, Nov 15 17, co sponsored by the Colorado Heart Association and the state department of public health, with Drs Paul D White, Boston, Gordon B Myers, Detroit, and John P Hubbard, Philadelphia lecturers (3) Poliomyelitis, Dec 13 15 (4) Pathological Physiological Seminars, Tuesday evenings beginning Sept 24 and continuing through Dec 15 Inquiries may be made to the Office of Director of Graduate and Postgraduate Medical Education, 4200 E Ninth Ave Denver 7

DISTRICT OF COLUMBIA

Annual District Meeting—The Medical Society of the District of Columbia will convene an annual session Oct 1-3 at the Hotel Statler under the presidency of Dr Frank D Costenbader Visiting speakers include the following

Richard H Freyberg New York Practical Considerations of the Management of Common Rheumatic Diseases
Alan C Woods Baltimore The Role of Corticotropin (ACTH) and Cortisone Therapy in Ophthalmology
John J McGraw Jr Bryn Mawr Pa Blood Dyscrasias Their Treatment by Cortisone and by Corticotropin
Rulon W Rawson New York Use of Corticotropin in Treatment of Neoplastic Diseases
E Cowles Andrus Baltimore Factors in the Selection of Cases for Surgery on the Heart Valves
William S Tillett New York Practical Aspects in the Clinical Use of the Streptococcal Enzymes Streptokinase and Streptodornase
Everett I Evans Richmond Thermal and Radiation Injury in Atomic Warfare
James S Tyhurst Halifax Nova Scotia Panic Syndrome in Atomic Warfare
Paul H Holinger Chicago Causes and Significance of Hoarseness
Samuel M Peck New York Fungus Infections and Their Treatment
Maurice L Tainter Rensselaer N Y Rationale of Selection Between Sympathetic Stimulants
Howard C Taylor Jr New York Carcinoma of the Cervix
Winslow T Tompkins, Philadelphia Nutritional Deficiencies as a Causative Factor in Premature Labor and Toxemia
Paul C Swenson Philadelphia Evaluation of Roentgen Procedures in Obstetrics
Meredith F Campbell New York Congenital Obstruction of the Urinary Tract
Joseph Hiram Kite Atlanta Early Diagnosis and Management of Some *Problems in Pediatric Orthopedics*
Edmund R McCluskey Pittsburgh Use and Abuse of Sulfonamides and Antibiotics

There will be sectional round table discussions from 2 to 4 p m each day

FLORIDA

City Gives Hospital Site—In ceremonies Aug 28 city officials of Winter Park presented a deed to 18 acres of city-owned property valued at $50 000 to the Memorial Hospital Trust Association The Memorial Hospital Trust Association of Winter Park was organized in March by a group of citizens who realized the need for a city hospital The fund drive is expected to open early this fall Plans for a 40 bed hospital have been drawn, and the ground acquired from the city will allow for building expansion, a nurses' home, and adequate parking areas The goal for the hospital drive has been set at one million dollars, one half of which will go into the building fund, and one half into a trust fund for maintenance All funds are expected to be raised locally with no aid from state or federal sources

AMERICAN BOARD OF NEUROLOGICAL SURGERY *Oral* Chicago Oct 25 26 *Oral* Chicago May 1952 Final date for filing applications for the May 1952 examination is Jan 1 1952. Sec Dr W J German 789 Howard Ave New Haven 4 Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY *Written* Feb 1 1952. Final date for filing applications is Nov 1 *Oral* Chicago June 7 13 1952. Final date for filing application is Feb 1 1952 Sec Dr Robert L. Faulkner 2105 Adelbert Road Cleveland 6

AMERICAN BOARD OF OPHTHALMOLOGY *Written* Twenty five centers Feb 4-5 1952. *Oral* Chicago October 8 13 Sec Dr Edwin B Dunphy 56 Ivie Road Cape Cottage Maine

AMERICAN BOARD OF ORTHOPAEDIC SURGERY Final date for filing applications for the 1952 Part II examinations is Nov 30 1951 Sec Dr Harold A Sofield 122 S Michigan Ave Chicago 3

AMERICAN BOARD OF OTOLARYNGOLOGY *Oral* Chicago Oct. 8-12 Sec Dr Dean M Lierle University Hospital Iowa City

AMERICAN BOARD OF PEDIATRICS *Oral* Buffalo Oct 26-28 Ex. Sec Dr John McK Mitchell 6 Cushman Rd Rosemont Pa

AMERICAN BOARD OF PLASTIC SURGERY Denver Oct 27 29 Final date for filing of case reports was Aug 30 Sec Dr Bradford Cannon Office of the Board 4647 Pershing Ave St Louis 8

AMERICAN BOARD OF PREVENTIVE MEDICINE *Written* San Francisco October 28 *Oral* San Francisco October 29 Sec., Dr Ernest L. Stebbins 615 North Wolfe St Baltimore 5

AMERICAN BOARD OF PROCTOLOGY Philadelphia Nov 17 18 Sec Dr Louis A Buie 102 110 Second Ave S W Rochester Minn

AMERCIAN BOARD OF PSYCHIATRY AND NEUROLOGY *Oral* New York Dec 17 18 Final date for filing applications was Sept. 1. Act Sec Dr David A Boyd Jr., 102 110 Second Ave., S W Rochester Minn.

AMERICAN BOARD OF SURGERY *Written* Various centers, Oct 1951 Final date for filing applications was July 1 *Written* Various Centers March 1952 Final date for filing application is Dec 1 1951 Sec Dr J Stewart Rodman 225 S 15th St Philadelphia

BOARD OF THORACIC SURGERY *Oral* St. Louis Nov 2 Sec Dr William M Tuttle 1151 Taylor Ave., Detroit 2 Mich

AMERICAN BOARD OF UROLOGY Chicago Feb 9-11 [illegible] Final date for filing applications is Sept 1 Sec Dr Harry Culver 10 Westwood Rd Minneapolis 16

DEATHS

Garrey, Walter Eugene, Nashville, Tenn , born in Reedsville, Wis , April 7, 1874, received his Ph D degree from the University of Chicago in 1900, and his medical degree from Rush Medical College, Chicago, 1909, extension instructor in zoology at the University of Chicago from 1894 to 1898 and fellow in physiology from 1898 to 1900, professor of physiology at Cooper Medical College, San Francisco, from 1900 to 1910, associate professor of physiology at Washington University in St Louis from 1910 to 1916, professor of physiology at Tulane University in New Orleans from 1916 to 1925, became professor of physiology at Vanderbilt University School of Medicine in 1925, and was professor emeritus there from 1944 to the time of his death, lecturer in general physiology, member of the research staff, and member of the board of trustees of the Marine Biological Laboratory at Woods Hole, Mass , member of the National Board of Medical Examiners from 1922 to 1934, member at large in the medical division and member of the executive committee in the biological division, National Research Council, member, American Association for the Advancement of Science, and the American Society of Biological Chemists, past president of the American Physiological Society and honorary member of the San Francisco Academy of Medicine, vice chairman of the Section on Pathology and Physiology of the American Medical Association in 1935-1936 and chairman in 1937, member of the Council on Physical Medicine and Rehabilitation of the American Medical Association since 1927, having been chairman of the Council s Committee on Scientific Research, published numerous reports on research in various fields of physiology, died June 15, aged 77, of carcinoma of the bladder

Harper, Cornelius A ⊕ Madison, Wis , born near Hazel Green, Wis , Feb 20, 1864, Columbian University Medical Department, Washington, D C , 1893, appointed to the state board of health in 1901 and made state health officer in 1904, carried forward a program of disease prevention, promoted health legislation and expanded the department, in 1943 resigned as state health officer but was retained as medical specialist in public health, prepared an authoritative history of public health in Wisconsin, being an actual compilation of the minutes of the state board of health since its inception in 1876, member of the House of Delegates of the American Medical Association in 1914, honorary life member of the American Social Hygiene Association and the Conference of State and Provincial Health Authorities of North America, of which he was president in 1908, past president of the Dane County Medical Society, and in 1931 president of the State Medical Society of Wisconsin, served as secretary of the Wisconsin Anti-Tuberculosis Association, in 1930 received the council award of the state medical society for meritorious service and in 1943 a citation for distinguished service, member of the American Public Health Association, awarded the honorary degree of doctor of science from Lawrence College, Appleton, in 1941 and an honorary degree of doctor of laws from the University of Wisconsin in 1945, died June 26, aged 87, of coronary occlusion

Bagby, Bathurst Browne, Edwardsville, Va , born in Stevensville, Va , June 3, 1879, George Washington University School of Medicine, Washington, D C , 1904, member of the American Medical Association, at one time health officer of Henrico and Southampton counties, for many years director of the state bureau of maternal and child health, served as chief health officer and epidemiologist of the city of Richmond on a temporary basis, retiring in June 1941, during World War II served as civil defense director of Northumberland County, past president of the Virginia Public Health Association, died July 6, aged 72, of coronary occlusion

Abersold, George William ⊕ Wheeling, W Va , College of Physicians and Surgeons, Baltimore, 1913, fellow of the American College of Surgeons, served during World War I, affiliated with Ohio Valley General Hospital, died July 26, aged 68, of coronary occlusion

Allen, Granville Stevens ⊕ Lawrence, Mass , Bellevue Hospital Medical College, New York, 1894, served during World War I, for many years on the staff of Lawrence General Hospital, died July 13, aged 84, of coronary thrombosis

Anderson, Hascal Blount ⊕ Watervliet, Mich , College of Medical Evangelists, Loma Linda and Los Angeles, 1932 served with the Indian Service, on the staffs of St Joseph, Mich , Hospital and Community Hospital in Watervliet, died in Mercy Hospital, Benton Harbor, July 20, aged 56, of hepatitis and cardiac decompensation

Barnes, Albert Coombs, Merion Station, Pa , University of Pennsylvania Department of Medicine, Philadelphia, 1892, author of many volumes on art, president of the Barnes Foundation, killed July 24, aged 79, in an automobile accident

Bartlett, Percy, Hanover, N H , Dartmouth Medical School, Hanover, 1900, member of the American Medical Association, professor of surgery at his alma mater from 1915 to 1939, when he became professor of surgery emeritus, fellow of the American College of Surgeons, served during World War I, for many years on the staff of the Mary Hitchcock Memorial Hospital, where he died July 6, aged 80, of cerebral hemorrhage due to arteriosclerosis

Bass, Leopold, Brooklyn, University of Dorpat Faculty of Medicine, Russia, 1894, affiliated with Maimonides Hospital, died July 16, aged 84, of hypertensive heart disease

Battle, James Fitzgerald ⊕ Seattle University of Georgia School of Medicine, Augusta, 1923, affiliated with Providence, Columbus and Doctors hospitals, died July 26, aged 58, of coronary occlusion

Becker, Charles Frederick ⊕ Camden, N J Jefferson Medical College of Philadelphia, 1915 specialist certified by the American Board of Psychiatry and Neurology served in France during World War I, on the faculty of his alma mater from 1922 to 1945, on the staff of Cooper Hospital, died in the U S Naval Hospital, Philadelphia July 23, aged 60, of carcinoma of the prostate with bone metastases.

Brown, Wilson C., Newberry, S C , Medical College of South Carolina, Charleston, 1888, died July 1, aged 90, of coronary occlusion

Cawthon, Edly Wilkerson, Plateau, Ala , University of Alabama School of Medicine, Mobile, 1908, member of the American Medical Association, fellow of the American College of Surgeons, affiliated with City Hospital in Mobile, died June 9, aged 77, of hypertensive cardiovascular disease

Cogger, Thomas Walter, Anna, Ill , Loyola University School of Medicine, Chicago, 1919, served during World War I, on the staff of the Anna State Hospital, formerly affiliated with Newberry (Mich) State Hospital, died in St Johns Hospital, St Louis, recently, aged 57, of carcinoma of the esophagus

Dodds, Susan L. Koons, Long Beach, Calif , College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1904, formerly a medical missionary in China, died July 6, aged 77, of carcinoma of the breast

Drake, Daniel Edgar, Newfoundland, N J , University of Vermont College of Medicine, Burlington, 1889 member of the American Medical Association, president of the board of health, affiliated with Idylease Sanatorium for many years, died in Franklin (N J) Hospital July 19, aged 87, of arteriosclerotic heart disease

---

⊕ Indicates Fellow of the American Medical Association

Heinen, Gustaf Frederick ⊕ Toledo, Ohio, Baltimore Medical College, 1902, died in St Luke's Hospital July 6, aged 79, of Parkinson's disease

Hipke, William, Marshfield, Wis , College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1891, member of the American Medical Association, died in Rogers Memorial Sanitarium, Oconomowoc, recently, aged 86 of arteriosclerosis

Hudson, Leo Arthur, Lancaster, Wis , University of Wisconsin Medical School, Madison, 1928 member of the American Medical Association co-owner of the Lancaster General Hospital, died May 26, aged 58, of coronary thrombosis

Hyde, Harold Valmore, Boston Harvard Medical School, Boston, 1914, member of the American Medical Association, formerly on the faculty of Tufts College Medical School, fellow of the American College of Surgeons, on the staff of the Boston City Hospital, died June 21, aged 63

Jones, George Pierce, Memphis, Tenn , Vanderbilt University School of Medicine, Nashville, 1902, died June 7, aged 73, of cerebral hemorrhage

Kemble, Earl Wallace, Golden, Colo , University of Colorado School of Medicine, Denver, 1913, member of the American Medical Association, died June 27, aged 61, of heart block

Levitch, Isaiah B , New York, Universitat Basel Medizinische Fakultat, Switzerland, 1906, member of the American Medical Association, died in Mount Sinai Hospital May 30, aged 70, of acute myocardial infarction

Morton, John R., San Marcos, Texas (licensed in Texas under the Act of 1907), in 1936 president of the Hays Blanco Counties Medical Society, died recently, aged 88 of chronic myocarditis

Planche, L. Stuart ⊕ New Rochelle, N Y , McGill University Faculty of Medicine, Montreal, Canada, 1921, member of the American Academy of Dermatology and Syphilology, specialist certified by the American Board of Dermatology and Syphilology, served in the British Navy during World War I, affiliated with New Rochelle Hospital, died in St John s Riverside Hospital in Yonkers, July 12, aged 55, of coronary thrombosis

Ploucher, William Allen, Upper Montclair, N J , Hahnemann Medical College and Hospital of Philadelphia, 1896, died recently, aged 78, of carcinoma of the prostate

Purcell, Edward, Oakland, Calif , University of Oregon Medical School, Portland, 1911, member of the American Medical Association, formerly city physician, served in France during World War I, affiliated with the Herrick Memorial Hospital, Berkeley, where he died July 7, aged 68, of coronary occlusion

Pyle, John Sherman, Toledo, Ohio, Bellevue Hospital Medical College, New York, 1886 formerly trustee of the University of Toledo affiliated with St Luke s Hospital, died July 7, aged 86, of carcinoma of the prostate

Richardson, Harold Edward ⊕ St Paul, born in Stevens Point, Wis , Feb 17, 1895 University of Minnesota Medical School, Minneapolis, 1920 specialist certified by the American Board of Internal Medicine, member of the Central Society for Clinical Research fellow of the American College of Physicians on the faculty of his alma mater, affiliated with Gillette State Hospital for Crippled Children, St Joseph s, St Luke s, and Ancker hospitals and the Charles T Miller Hospital, where he died June 18, aged 56, of coronary occlusion

Roth, John LeRoy ⊕ Conshohocken, Pa , Hahnemann Medical College and Hospital of Philadelphia, 1918 served on the staffs of Montgomery, Norristown State and Sacred Heart Hospitals in Norristown, died June 21, aged 72, of coronary thrombosis

Sarjeant, George Evans, Jacksonville, Fla Leonard Medical School, Raleigh, N C., 1911, died June 14, aged 66, of cardiovascular disease and nephritis

Shuman, Jesse Elmer ⊕ Bloomsburg Pa , University of Pennsylvania Department of Medicine Philadelphia 1891, past president of the Columbia County Medical Society for many years served on the school board associated with Bloomsburg Hospital, died recently, aged 81, of complications which developed after a fall

Snipes, James Johnston, Glendale, Calif Medical Department of Tulane University of Louisiana, New Orleans, 1903 for many years practiced in Lincoln, Neb served during World Wars I and II, member of the Sons of the American Revolution and president of the Nebraska chapter for two years, died June 14 aged 71, of coronary sclerosis

Sutton, Richard John, Oakley, Idaho, Chicago College of Medicine and Surgery, 1913 member of the American Medical Association died June 3 aged 66, of heart disease.

Tapley, Thomas Sumner, Tremont, Maine, University of Vermont College of Medicine, Burlington, 1899, died in McKinley June 16, aged 82

Thayer, Lewis Gilmore, Grants Pass, Ore Gross Medical College, Denver, 1900, died in Portland June 25, aged 83, of arteriosclerosis

Thomas, George Henry, Minneapolis, Harvard Medical School, Boston, 1895, member of the American Medical Association, died June 3, aged 82.

Thompson, Lillian Marcelletto ⊕ Chicago the Hahnemann Medical College and Hospital Chicago, 1909, died June 14, aged 77, of coronary occlusion

Trowbridge, Charles Henry, Spokane, Wash , College of Physicians and Surgeons, medical department of Columbia College, New York, 1894 died in Spokane Sanitarium June 2, aged 91, of arteriosclerosis

Ursich, Joseph Ansel, Milwaukee, Northwestern University Medical School, Chicago, 1948, served a residency at Milwaukee County Hospital, died June 22, aged 25, of poliomyelitis

Valentine, Aloysius W., Washington, D C , University of Maryland School of Medicine, Baltimore, 1904, member of the American Medical Association, died in Baltimore July 5, aged 76 of arteriosclerotic cardiovascular disease

Van Zanten, Wesley William ⊕ Sheboygan, Wis , Marquette University School of Medicine, Milwaukee, 1931, for many years county coroner, died June 4, aged 47, of coronary occlusion

Wallace, James Henry, Youngstown, Ohio, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1908, member of the American Medical Association, died recently, aged 74

Wasson, Guy Thornton, Bucyrus, Ohio, Eclectic Medical Institute, Cincinnati, 1903, member of the American Medical Association, past president of the Ohio Public Health Association, for many years county health officer; died June 11, aged 72.

Wellman, Harrison M , St. Petersburg, Pa , University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1916, member of the American Medical Association, past president of the Clarion County Medical Society, for many years member of St Petersburg Richland school board and the Clarion County school board and was a past president of both organizations, served four terms as county coroner, died in the Western Pennsylvania Hospital, Pittsburgh, June 7, aged 62

White, John W., Atlanta, Ga , Atlanta Medical College, 1891, served as a member of the Fulton County Lunacy Commission, died June 28, aged 88, of arteriosclerotic heart disease

White, Orton Eugene ⊕ Angola, N Y , University of Buffalo School of Medicine, 1912, specialist certified by the American Board of Otolaryngology, died in Buffalo General Hospital July 18, aged 62, of arteriosclerotic heart disease

Wolin, Benjamin Maurice ⊕ Chicago Bennett Medical College, Chicago 1915, served during World War I, died July 7, aged 61, of bronchogenic carcinoma

Worthman, Edward H., Louisville, Neb John A Creighton Medical College, Omaha 1900 died May 29, aged 76 of cardiac decompensation and cirrhosis of the liver

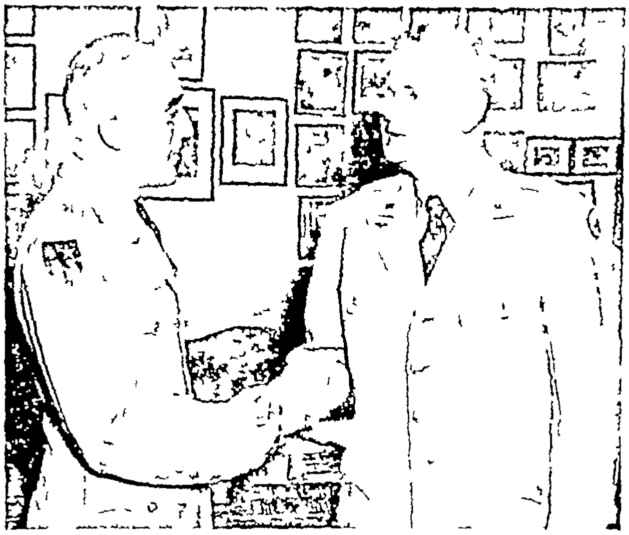
Yates, Charles Everett ⊕ Baldwin City, Kan College of
cians and Surgeons of Chicago School of Medicine of
versity of Illinois 1904, served during World War
affiliated with the Indian Service, died June 30, a
cinoma of the liver

GOVERNMENT SERVICES

ARMY

Brigadier General Hays Named Deputy Surgeon General.—Brig Gen Silas B Hays, MC, on Aug 24 assumed his duties as Deputy Surgeon General of the Army following a brief ceremony in the office of Maj Gen George E Armstrong, the Surgeon General He succeeds Brig Gen Paul I Robinson who will take command of Fitzsimons Army Hospital at Denver, Colo

In his last assignment as Surgeon of the Japan Logistical Command, General Hays was responsible for management of Army hospitals in Japan, the evacuation of all casualties from Korea, and the furnishing of medical supplies and equipment for both Japan and Korea During World War II General Hays served as chief of medical supply for the European Theater He was awarded the Legion of Merit with Oak Leaf Cluster, the Croix de Guerre with Palm, and the Order of Santé Publique from France for his work in that country On his return to the United States, he was appointed chief of the supply division, Office of the Surgeon General, where he remained until his assignment to the Far East Command in May 1950



The new Deputy Surgeon General of the Army Brig Gen Silas B Hays MC, is congratulated on his appointment by Maj Gen George E. Armstrong Surgeon General.

New Foot Powder to Prevent Cold Injuries—Army medical research has developed a new foot powder that reduces foot perspiration, offering partial protection against cold injuries to troops living or fighting in cold weather areas, the Department of the Army announced recently Arctic tests have shown according to Maj Gen George E Armstrong, Army Surgeon General, that the foot powder reduces sweating by as much as 24% This development is of major importance to troops in a cold environment because cold injury more frequently involves the feet than any other extremity Trenchfoot develops in wet cold, whereas frostbite is associated with 'dry cold" Man s feet perspire under almost all conditions, but the secretion of the sweat glands is especially harmful in cold weather because crystallized particles of perspiration act as conductors of cold, thereby diminishing the insulative value of winter footwear By reducing foot sweating, the new powder will make the winter soldier's heavy socks and boots more effective against cold injury

The new preparation has a powdered talc base and contains aluminum chloride and potassium alum, the anhidrotic agents, well as boric acid, salicylic acid and starch The initial ship- of the powder will be delivered to the Army this fall and will be issued to troops assigned in cold weather areas including those in Korea The powder will be packaged in seven separate envelopes contained in one heat sealed cellulose kit This is a soldier s one week supply Troops will be instructed in its use

Additional research, using a combination of a rubber barrier sock and the new foot powder, has shown a 60% reduction in perspiration A new type rubber boot is being developed that will embody the principle of the rubber barrier sock to eliminate the extra rubber type sock It will be used in combination with the foot powder The foot powder alone is intended to be used where the military situation permits a daily change of socks and shoes

Recovery Rate High In Korea Soldiers.—Back from a Korean inspection trip, Army Surgeon General George Armstrong reports that early first aid is a major factor in the high recovery rate Only 25 men out of every 1,000 now die of their wounds, in contrast to the World War II rate of 45 in every 1,000

Work of the litter bearers is complicated by the rugged terrain, Surgeon General Armstrong said The average trip by litter to an aid station requires one and one half hours, although during the recent heavy fighting in the mountainous eastern front six hour trips were not unusual, with eight men assigned to each litter

He said he questioned more than 150 recently wounded men on how soon they received first aid 'Every one,' the Surgeon General reported, "said right away and seemed puzzled at the question The only occasions I was able to learn about when men were unattended for 30 minutes or more were explained by the fact the aid man assigned to the unit was himself killed or wounded '

General Armstrong praised the line officers for the support they are giving the medical department Now, when men are supposed to get suppressive drugs or other regular medication we know they get it," he said As an example of the attitude of commanding officers, General Van Fleet has ordered that every electric fan in Korea be used to make patients more comfortable "

Of the wounded, Surgeon General Armstrong said that 26% return to duty without leaving Korea and 61% without leaving Japan An additional 14% are able to return to duty after hospitalization in the United States. Even a few amputees are sufficiently rehabilitated to return to duty

Surgeon General Armstrong is hopeful that the new drug primaquine may be found to be a cure for malaria as well as a suppressive He said recent outbreaks of the disease among Korea veterans is not as serious as it might be because of effective and prompt detection and treatment in this country

Medical Personnel Win Decorations in Korea.—A preliminary survey reveals that over 2 800 decorations have already been awarded to Army Medical Service personnel for service in the Korean campaign, Maj Gen George E Armstrong, Army Surgeon General, announced Aug 28 The total includes a posthumous award of the Medal of Honor to Private Richard C Wilson, aid man with the 187th Airborne Infantry Regiment, 9 Distinguished Service Crosses, 2 Distinguished Service Medals, 149 Silver Stars, 28 Legion of Merit awards 2 Distinguished Flying Crosses 11 Soldier s Medals, 1,369 Bronze Star Medals, 9 Air Medals, 126 Commendation Ribbons, and 1,110 Purple Hearts Eighty five per cent of the decorations were awarded to Army Medical Service enlisted men Medical Service Corps officers serving as assitant battalion surgeons, administrators, supply officers or in similar capacities, received almost 10% of the total Medical Corps officers received 105 decorations, including 1 Distinguished Service Cross, 2 Distinguished Service Medals, 7 Silver Stars, 18 Legion of Merit awards, 59 Bronze Star medals 8 Air Medals, 6 Commendation Ribbons, and 4 Purple Hearts

The tabulation was based on records now on file in the Adjutant General's Office and it is necessarily incomplete since new data arrives periodically from the Far East Command where the decorations are either awarded or authorized

Walter Reed Centennial.—Brig. Gen Sam F Seeley made the principal address at 'Walter Reed Night," celebrated Sept 1, by the 'Faith of our Fathers" pageant, the Sesquicentennial Commission s outdoor presentation in Washington, D C The occasion marked the opening of events scheduled to honor the 100th anniversary of the birth of Maj Walter Reed, famed conqueror of yellow fever, who was born Sept 13, 1851, at Belroi, Va General Seeley, MC, is chief of Walter Reed Hospital s surgical service

NAVY

109th Anniversary for Bureau of Medicine and Surgery.—The 109th anniversary of the Navy's Bureau of Medicine and Surgery was observed on Friday, Aug 31 The bureau can point to an impressive list of accomplishments since its establishment by an Act of Congress in 1842 Today the Navy operates modern, fully equipped, air conditioned hospital ships in support of sea and land operations All Navy ships carry a representative of the Medical Department, ranging from an enlisted hospital corpsman, qualified for duty independent of a medical officer, aboard a mine sweeper to the medical officer staffed aircraft carrier with its modern operating room Ten per cent of the Navy medical officers on active duty have been certified in various specialties by American Boards, and hospital corpsmen are trained in 40 technical specialties allied to medicine Navy flight nurses are stationed around the world

Through continuing efforts of the bureau to improve the skill and efficiency of its personnel, new concepts of naval medicine are being developed Several advances were shown for the first time in Korea the mobile surgical teams, epidemic disease control units operating with the fleet and in the field with the Marine Corps, and lighter, more compact field equipment Another facet, the Occupational Health Service Program to promote and conserve the health of the employees of the Navy's industrial establishments, has proven beneficial production wise

The Medical Department's record of caring for the sick and injured, its contributions to the art and science of medicine, and the personal sacrifices and valor of its personnel make up an outstanding page in naval history

Seven years ago while serving as Chief of Surgery at the San Diego Naval Hospital, the present Surgeon General Rear Adm Lamont Pugh, observed that, 'men as well as ships need a haven for repair Today, the Navy s Hospital Expansion Program echoes this statement

Surgeon General Honored by International College of Surgeons—The Surgeon General of the Navy, Rear Adm Lamont Pugh, MC, USN has been selected as an Honorary Fellow of the International College of Surgeons The diploma and insignia of the college were conferred on him at the 16th Annual Assembly of the United States and Canadian Chapters of the International College of Surgeons held at the Palmer House, Chicago, Sept 10-13

The letter of notification to Admiral Pugh stated, It was the wish of our Board and our membership that you be so honored because of your many contributions to the art and science of surgery and your constant efforts in advancing the ideals of our great profession "

Send Representative to Industrial Medical Congress.—Capt Robert W Babione, MC, USN, director of the preventive medicine division, represented the Navy at the 10th International Congress of Industrial Medicine held Sept 9 15 at Lisbon, Portugal The Congress was sponsored by the Permanent Industrial Commission for Industrial Medicine with headquarters at Geneva, Switzerland

Upon termination of the congress Captain Babione made a brief visit to the Naval Medical Research Unit at Cairo, Egypt

First Editor of Armed Forces Medical Journal Retires.—Capt Joseph L Schwartz, Medical Corps USN, formerly of 8203 Grubb Rd Silver Spring, Md, will be placed on the retired list of the Navy on Sept 1, after completion of more than 31 years of active military service in the Medical Corps of the Navy During this time he has held a variety of important posts including the editorship of the U S Armed Forces medical journal to which he was appointed in January 1950

AIR FORCE

Human Factors in Flight—New studies of the airman s reactions to high speed, high altitude, and strange environments are badly needed in the Air Force, Col Adolph P Gagge director of research in the Surgeon General's office, told a group of military and civilian scientists assembled in San Antonio, Texas, Aug 27-29 The meeting of specialists from universities all over the United States and Canada was held under the joint auspices of the School of Aviation Medicine and the office of the Air Force Surgeon General to plan a research program in the field of psychophysiology

"During the last years of the war," said Colonel Gagge, 'while aircraft development in jets and rockets made tremendous progress, research in the effects produced by these craft on the men who fly them fell far behind, because scientific brains had to be diverted to more immediate problems For several years after the war, Air Force research was restrained by the policy of strict military economy then in effect Now we are urgently in need of answers to the questions of human tolerance raised by present-day flight "

Five broad areas of investigation demand research, Colonel Gagge added These are the following the care and treatment of flying personnel in modern warfare, results of extreme speed and altitude, conditions found in special environments such as the stratosphere or beyond it, in outer space flying safety and the effects of new weapons and unusual methods of warfare All these, said Colonel Gagge, are fruitful fields of study for psychophysiologists, who deal with the peculiar reactions of the central nervous system to rare and unexpected circumstances encountered in flight

The conference opened with a welcoming address by Col Paul A Campbell director of research at the School of Aviation Medicine Presiding was Clifford T Morgan, Ph D, chairman of the department of Psychology at Johns Hopkins University in Baltimore Also present were more than a dozen noted civilian specialists as well as additional representatives of the Surgeon General s office, the School of Aviation Medicine, and the Aero Medical Laboratory at Wright Patterson AFB in Dayton, Ohio

School of Aviation Medicine Increases Output—With the expanding U S Air Force impatient for medical officers trained as specialists in aviation medicine, the Air Force School of Aviation Medicine went into high gear and during the past 12 months graduated or enrolled more than 500 Aviation Medical Examiners In Air Force units, their primary duty will be to conduct physical examinations for flying On graduation of the current class, which enrolled on Aug 27, the figure will be well beyond the 500 mark

Doctors from 72 accredited medical schools in 38 states and the District of Columbia were trained at the School of Aviation Medicine during the scholastic year ending Aug 31 This was revealed in a recent survey by Dr Glenn L. Lembke, director of education at the aeromedical school

In addition, seven foreign nations sent medical officers to the U S Air Force school during the same period These included England Uruguay, Switzerland the Philippine Republic, Iran Egypt and Nicaragua

A large majority of the students were reserve officers of the Air Force Medical Corps called to extended active duty due to the nation s rapid military expansion The regular Air Force, however, and the Air National Guard were well represented in the eight Aviation Medical Examiner classes enrolled between Sept 1, 1950 and 1951

New Assignments.—Lt Col James W Humphreys Jr has been assigned chief of the general surgical section, USAF Hospital Wright Patterson Air Force Base, Dayton, Ohio He came from Fitzsimons Army Hospital, Denver, where he completed three years residency in surgery Colonel Humphreys saw action in the European theater as commanding officer of the 430th Medical Battalion and the 30th Medical Group He was later assigned as staff surgeon to the U S Military Mission Iranian Army, Teheran Iran. He has received the Iranian award for duty in Iran and the Legion of Merit He succeeds Lt Col Voris F McFall, who has been assigned as base surgeon at Norton Air Force Base, San Bernadino, Calif

FOREIGN LETTERS

ITALY

International Scientific Symposium—An important international scientific symposium, the first since the end of World War II, was held during the past weeks in the Siculorum Gymnasium, which today is the University of Catania Speakers were W H Schopfer (director of the Institute of Botany and Biology of the University of Bern), C Lian (director of the medical clinic of the Hôpital de la Pitié of Paris), J Courtois (director of the Institute of Pharmacology of the University of Paris), A Gigon (director of the medical clinic of the University of Basel), and C Jiménez Diaz (director of the medical clinic of the University of Madrid) Among the Italians attending were L Condorelli (dean of the faculty of medicine of the University of Catania), P Di Mattei (faculty of medicine of the University of Rome), and G C Pupilli (director of the Institute of Human Physiology of the University of Bologna)

ANTAGONISM BETWEEN VITAMINS

It is well known that there are complicated interrelations between the factors of nutrition Woods demonstrated that the bacteriostatic action of the sulfonamides is due to a mechanism of interference and antagonism among vitamins essential to the bacteria It was also demonstrated that avitaminosis in man is not always caused by the vitamin that clinically and on laboratory examinations seems to be deficient in the greatest degree Sometimes an apparent vitamin deficiency conceals antagonistic reactions For this reason, the administration of large doses of a specific vitamin may produce a paradoxical phenomenon, i e, a decrease of the natural quantity of that same vitamin (avitaminosis caused by hypervitaminosis)

This phenomenon is difficult to demonstrate in human beings, because of their complicated nutritive equilibrium, but it can be followed step by step in lower organisms as, for example, in Phycomycetes Prof Schopfer reported that these micro-organisms require definite amounts of vitamins to grow and to develop If these amounts exceed a certain limit, the organism becomes vitamin deficient in spite of the excessive amount of vitamin administered Schopfer demonstrated a disturbance of the vitamin balance by substituting in the culture a vitamin with its antivitamin, by inhibiting the biosynthesis of a vitamin, or by greatly increasing in the culture the percentage of only one vitamin He thus has clarified two procedures, which he calls "molecular micrurgy' and molecular teratology" These procedures elucidate the analogous mechanisms observed clinically and therapeutically in man by Waife, Woods, and Fildes

While the micro-organisms are soon impaired as a result of molecular micrurgy or molecular teratology the human organism at first defends itself vigorously against the imbalance caused by inadequate doses of vitamins Therefore, when excessive doses of vitamin are administered, one does not observe the severe damage that, based on the experiment on Phycomycetes, is theoretically expected The human sets up this defense also against the devitaminizing action of some drugs Dr Di Mattei proved the existence of devitaminization by examining the urine of many patients to whom he had therapeutically administered special drugs He found (1) a vitamin that usually is not found in the urine, when the patient was given a certain drug for example, vitamin A in the urine of syphilitics treated with bismuth compounds, (2) increase in the elimination of specific common vitamins, for example, a great increase in ascorbic acid, which is always present in the urine, following salicylate, barbiturate, or cinchophen therapy, and nicotinamide in the urine of a patient treated with mercury compounds, (3) the disappearance of a common vitamin, for example, disappearance of ascorbic acid following massive doses of quinine or quinacrine hydrochloride (atabrine®), or of nicotinamide following sulfaguanidine therapy

Thus, drugs can cause avitaminosis by (1) preventing the absorption of nutritive vitamins, as happens when astringents, solvents, or laxatives are administered, (2) stimulating the elimination of vitamins by the urine, as happens when diuretics, cholagogues, and laxatives are administered, (3) speeding up the consumption of vitamins, as when the patient is treated with sulfur, iodine, pyrogenic compounds, or with drugs stimulating metabolism, (4) removing reserves of vitamins from the parenchymal tissues where they accumulate, as may result from treatment with salicylates, barbiturates, or from chemotherapy, (5) preventing the accumulation of vitamins, as by bismuth and by arsphenamine, (6) blocking the endogenous elaboration of vitamins, which happens when one administers intestinal disinfectants (sulfaguanidine or some antibiotics) that are too strong and destroy not only the parasitic intestinal flora but also the flora that produces vitamins, (7) arresting the action of the vitamins, as in the case of administration of sulfonamides, which exert enzymatic antivitaminic activity, (8) preventing the utilization of vitamins, as in cases of ether or chloroform anesthesia

Another factor causing avitaminosis is encountered after enterocolitis, when one parasitic group of the intestinal flora suppresses the group that forms vitamins According to Jiménez Diaz, who lectured on "A New Aspect of Intestinal Autointoxication, sprue, with its many symptoms, is simply an intestinal bacteriosis Owing to the chronic inflammatory condition of the intestine, the bacteria that destroy the vitamins produced by other bacteria multiply The patient soon has symptoms of deficiency in vitamins of the water soluble vitamin B group Later, other disturbances result from vitamin D deficiency Then the parathyroid glands, because of calcium lack, elicit the chain of nutritional hormone disorders that cause either pseudoeclamptic attacks with loss of consciousness or decalcification of important bones, especially intervertebral disks According to Jiménez Diaz, sprue can be associated with deficient fat absorption This, however, is secondary to, or concurrent with, bacteriosis, but is never, as was formerly believed, the predominant cause of the disease Jiménez-Diaz explains phenomena of histamine overproduction in allergic patients suffering from asthma and chronic recurrent urticaria as correlated with this bacteriosis The groups of the intestinal flora that produce histamine predominate over the groups that do not produce this substance Allergic manifestations are caused by the increased production of histamine Numerous herpetic disorders, notably on the lips and tongue, are the result of destruction by some antibiotics (chloramphenicol) of the intestinal flora that produces vitamin B Lesions of this type are being cured in France by a combination of antibiotics and of yeasts and ferments rich in vitamin B It seems likely that the rapid fattening of pigs and of turkeys with broth cultures of antibiotics is due to a selective process of destruction of bacteria that are parasites of the vitamins

Various interactions of drugs vitamins, bacteria, and histamine could explain the urticaria produced by sulfonamides Owing to the action of the sulfonamides, therefore, the histamine producing flora prevails, which explains the frequent cases of urticaria observed in patients with intestinal disease

Tumors of the Upper Respiratory Tract.—At a meeting of the Association of Medicine and Natural Sciences of Parma, Prof Bonati discussed rare neoplasms of the upper respiratory tract He described a case in which tumors developed simultaneously in two distinct and independent organs The patient, a man of 53, was a heavy drinker and smoker, syphilitic, and had a pronounced heredity for neoplastic disease from both parents After one year of severe aphonia, he underwent medical examination One tumor was observed in the larynx, and a second one, not ulcerated and clearly demarcated from the adjacent tissues, was observed in the posterior part of the right lateral margin of the tongue. Adenopathies suggesting a relationship between the two neoplasms were not observed Surgical intervention confirmed the observation made on endoscopic examination i e, that the tumor was endolaryngeal and was limited to the right vocal cord and the right laryngeal pouch Microscopic examination revealed the identical structure of the two tumors, which consisted of spinocellular epithelial cells Some authors tend to exclude from the malignant tumors those of identical structure, while others favor the concept that two or more tumors

---

The items in these letters are contributed by regular correspondents in the various foreign countries.

of identical structure may occur simultaneously in two different parts of the organism without any interdependence

This clinical case is particularly interesting because of (1) the patient s evident heredity for blastomas (six of the nine members in three generations of his family had malignant neoplasms) (2) the rare location of the tumor (in the larynx and on the tongue), and (3) the presence in the patient of the elements most commonly believed to predispose to malignant neoplasm (syphilis and excessive use of tobacco and alcohol) Among the various pathogenic theories of malignant tumors, Prof Bonati mentioned that of blastomatous diathesis (Hardy, Bazin) and the theories against this (Hansemmann, Roussy, and Lubarcs) and that of embryonal infiltration (Durante, Ribbert, and Vogt) The speaker is inclined to classify this case according to the first pathogenic theory, that of blastomatous diathesis

At another meeting of the association, Prof A Rossi discussed acute tuberculosis of the hilus, recently described by Greppi and Dogliotti He spoke of its relatively high incidence, emphasized the difficulties of early diagnosis, and discussed the basic importance of the roentgenologic investigation He reported his own results, based on a study of tracheobronchial adenopathies that he obtained by tomography

He observed that the shadows of the hilus do not always show the characteristics demonstrated by Greppi and Dogliotti, in fact, the shadow of the hilus, when enlarged and deformed, may have a marmoreal or areolar instead of a homogeneous aspect, with contours sometimes diffuse, sometimes clear and polycyclic In every case, however, sectional roentgenography shows that, when the median plane is reached, the perihilar shadow, which was observed on direct examination, is in some phases homogenous, while in others it appears as a group of nodular patches surrounded by an opaque halo varying in size Moreover it is possible to distinguish clearly the perifocal exudative infiltration in the various layers

If the lesion is paratracheal, the shadows of the hilus are often associated with perihilar and particularly with mediastinal shadows, which have characteristics identical to those of the shadows of the hilus These shadows are homogeneous, varying in shape (piriform, quadrangular, or with polycyclic and diffuse contours) they are generally very large, entering the angle of the bifurcation of the trachea in a conelike shape. Sometimes they extend into the entire space between the trachea and the bronchi, either spreading between the primary bronchi or spreading generally into the right side, under the bronchus and the lower lobe In some cases where the direct examination is negative, sectional roentgenography reveals isolated mediastinal locations Stenosis of lobar bronchi with atelectasis is frequent Sometimes the fissures are involved, appearing as capillary or almost capillary striations

From the observations made in a complete roentgenologic investigation of the thorax, Rossi concludes that the term acute tuberculous disease of the mediastinum and of the hilus should be applied to this peculiar clinical picture The stratigraphic pictures give evidence of a generally postprimary tuberculous form with exudative characteristics In some cases, however, a late primary form cannot be excluded

SPAIN

Annual Meeting of Society of Nutrition and Digestion —The fourth annual meeting of the Spanish Society of Nutrition and Pathology of Digestion was held Dec , 1950 in Madrid, at the headquarters of the Spanish Medical Association (Colegio Oficial de Médicos) Dr H G Mogena presided The first official topic was diabetes Drs J C Oya and J L Rodriguez Miñón discussed methods of obtaining experimental diabetes, especially alloxan diabetes The speakers, in collaboration with Drs C Jimenez Diaz and F Grande Covian demonstrated that, even when high doses of alloxan are injected into dogs (100 mg per kilogram of body weight) it is possible to prevent the onset of diabetes by previously clamping the vascular pedicles of both kidneys The injection of nondiabetogenic doses of alloxan (30 mg per kilogram of body weight) to dogs with kidney damage induced by uranium is followed by diabetes On the other hand, injection of alloxan to depancreatized dogs aggravates the disease considerably However, if the injection is made after exclusion of the circulation of both kidneys aggravation of diabetes does not occur If both kidneys are removed in depancreatized dogs, diabetes becomes worse Since this effect does not occur in depancreatized dogs when the ureters are ligated it would appear that aggravation of diabetes following kidney damage or removal is not due to uremic intoxication or deficient urinary elimination of dextrose

Oya and Rodriguez-Miñon studied alloxan resistance in animals In dogs that received an injection of alloxan diabetes developed but disappeared spontaneously after which the animals became resistant to repeated injections of diabetogenic doses of alloxan in some cases even 21 months after the first injection These additional injections did not produce the characteristic initial variations of glycemia or modify the response of the animals to glucose tolerance tests This response seems to be due to a local immunity in the kidneys and, experimentally, in the liver The speakers analyzed chronic alloxan diabetes, stressing the differences between this form of experimental diabetes and diabetes due to removal of the pancreas Two dogs treated with alloxan survived for 1,105 and 1,248 days, respectively Blood sugar, during fasting was over 200 mg per 100 cc , and the animals had severe glycosuria Insulin was not administered, and ketonuria did not develop

Histologic study of the pancreas showed lesions of the same type as those described by other observers However, they are not diffuse as might be expected from diabetes caused by insular lesion only On the other hand, the same lesions were observed in experimental conditions that were not followed by diabetes, thus indicating participation of the kidneys and the liver in alloxan diabetes

The second official topic was pathogenesis of diabetes Dr L Castro of the Faculty of Medicine of Seville was the official speaker He discussed carbohydrate metabolism and its relation to fat and protein metabolism in the genesis of diabetes He pointed out that the so-called modern period in the study of diabetes started (about 1930) with the publications by Dr Samuel Soskin (Medical Research Institute of Michael Reese Hospital, Chicago) and collaborators Castro considers prediabetes a clinical reality, a period during which the metabolism of carbohydrates gradually changes He also discussed pituitary and thyroid diabetes (Houssay) and recent studies on the relation of sulfur and sulfur bearing compounds to carbohydrate metabolism He observed, during experiments, that prevention of the inflow from the vena porta into the pancreas followed by injection of insulin into the vena porta, results in an increase of blood glutathione content. He discussed the metabolic disturbances involved in the development of diabetes Dr Castro agreed in principle with the concept of impaired utilization of dextrose

The third official topic was treatment of the complications of diabetes Dr F Jimenez Garcia of Madrid was the official speaker Over a period of 25 years, he treated 2,800 diabetic patients, 83 of whom were in coma The speaker listed conditions that occur frequently in association with diabetes, such as diseases of the skin the sense organs, the nervous system, the kidney, the digestive tract, and the cardiovascular system, as well as acute and chronic infectious diseases, trauma surgery, pregnancy, childbirth, and lactation He dealt also with insulin resistance, severe acidosis, precoma hypoglycemic coma, and simple hypoglycemia He stressed the importance of Root s method of treating coma and of avoiding administration of dextrose solution He emphasized the need of early control of ketosis and the importance of treating complications, especially coma in special clinics The physician should be at the patient s bedside during coma until the patient recovers consciousness He denied the value of therapeutic rules concerning dosage of insulin in coma However he gave approximate rules, stressing that they are not applicable in all cases He pointed out the frequency of hypopotassemia in diabetic coma and the methods of diagnosis and treatment

The fourth official topic was diabetes as a social problem Prof J L Rodriguez Candela of the University of Valladolid was the official speaker Dr Hagedorn of Copenhagen lectured on initial stages and early diagnosis of diabetes Drs Civeira, Vilaclara Vidal Ribas Rocha Calvo Melendro Grande, Roda, Oliver Pascual Castro Fariñas and Romero Calatayud also read articles on diabetes

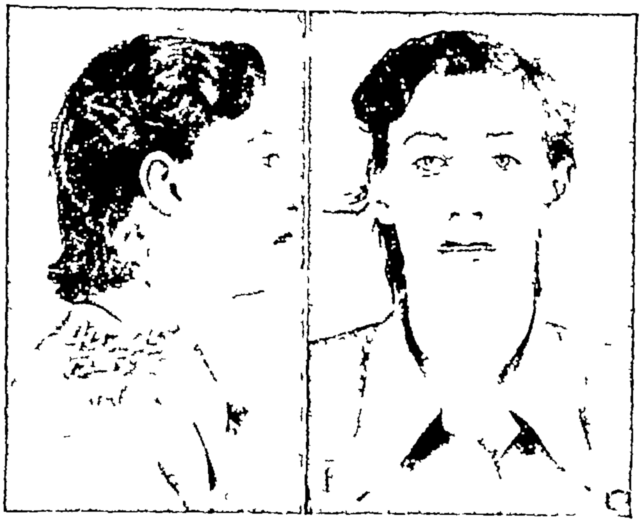
The Spanish Society of Pathology of Digestion and Nutrition has published the papers read at this meeting

CORRESPONDENCE

APPREHENSION OF MEDICAL EMPLOYEE

To the Editor—We wish to enlist your aid in apprehending Johanna A Simendinger, with many aliases She is described as 25 years, 5 ft 7 in, 108 lb, born in Johnstown, Pa, on Oct 25, 1925 Her fingerprint classification is 29/17 W/U 110/110 18/17

While employed in a local doctor's office, this subject cashed approximately $1,000 worth of checks, forging the doctor s name Because of her experience in a medical office, she may attempt to seek employment with other physicians



The accompanying photograph of her was taken in Minneapolis in 1949 If it would be possible to print this photograph in your publication, we feel that it would not only assist us in serving our Forgery Warrant (No F-3310, Bail $3,000) but would also serve to protect your subscribers Should this subject be recognized and apprehended, please refer to Long Beach Police Department Crime Report No 325 910

William H Dovey,
Chief of Police, Long Beach, Calif

PHYSICIANS FOR GUAM

To the Editor—During the past few years, the Territory of Guam has expanded at a rapid rate Economically the territory is progressing toward stability, after several years of war and enemy occupation, and this has naturally brought about an increase in commercial activity with a concomitant rise in population

Prior to the inauguration of civil government for the territory, the naval establishment provided dental care for the civilian population, but now the services of the Navy dentists and technicians are no longer available to the local residents

Exclusive of the military, there are approximately 30,000 local residents of Guamanian ancestry, and about 3,500 off-island residents In addition, there are some 7,000 contractors' employees of United States citizenship and some 12,000 contractors' employees of Philippine citizenship The contractors' employees are cared for on a contract basis

At the present time there are two private practicing doctors of medicine on the island, and there is a definite need for more

The Government of Guam maintains a 315 bed hospital with a competent staff, including specialists in most fields of medicine The hospital has a ward available for private patients and is open for doctors to care for their private patients

The climate on Guam is very similar to that of Florida or Honolulu The island is in a most interesting period of political and economic growth and approaching maturity While rehabilitation is not complete, living can be pleasant and interesting for a person with intelligence, curiosity, and adaptability

The Government of Guam would appreciate applications from practicing doctors of medicine for a license to practice on Guam The requirements for obtaining a license on Guam are graduation from a recognized medical school, a license to practice medicine in one of the 48 states or a territory having laws of reciprocity with one of the states, or the taking of an examination in lieu of reciprocity Any person interested in practicing medicine on Guam should communicate with the Executive Secretary, Commission on Medical Licensure, Government of Guam

Carlton Skinner,
Governor of Guam.

PHOSPHORUS POISONING

To the Editor—We read your stimulating editorial on "Acute Phosphorus Poisoning' in The Journal, June 2, 1951 (page 478), with great interest In bringing the subject of phosphorus poisoning to the attention of the medical profession, there is one practical point which we have encountered (*Gastroenterology* 17 279 [Feb] 1951) and feel should be emphasized This is the latent period or so-called period of quiescence It is a variable interval of time during which there is a subsidence of symptoms between the original gastrointestinal symptoms and the appearance of systemic complaints The former symptoms are thought to be due to direct irritation of the gut by the phosphorus, while the later complaints are attributed to the building up of high concentrations of phosphorus in the vital organs This period of remission may lull the physician into a false sense of security so that he discharges the patient as fully recovered, only to have him return in a day or two with more serious systemic symptoms Valuable time has been lost during which vigorous systemic treatment (high carbohydrate diet, intravenous glucose, amino acids, plasma vitamins, oxygen inhalation and liver extract) should have been employed, thus avoiding tissue damage, shock and often death

Since, in many cases of phosphorus poisoning, the latent period presents a deceptive picture to the physician of the subsidence of signs and symptoms without apparent recovery and since an awareness of this latent period may lower the mortality rate because of the continuation of therapy during this crucial time interval, we feel that it should be emphasized in any discussion of acute phosphorus poisoning

ADIE'S SYNDROME

To the Editor—Your correspondent Dr Wartenberg (The Journal, July 21, 1951, page 1152) appears to have overlooked the fact that the association of a tonic pupil and the absence of tendon reflexes was first described in England by Markus in 1906 The reference is C Markus, Trans Ophthalm Soc U K., 1906, *26* 50 The evidence that Markus first drew attention to the combination of signs often referred to as Adie's syndrome appears to be indisputable

NURSING IN SWEDEN

To the Editor—Some time ago I wrote objecting to your reports on the poor Swedish nursing situation I regret to report now that university and state hospital nursing is "fair," while private hospital nursing is on a very low level Sweden is in my opinion headed for state medicine

MEDICOLEGAL ABSTRACTS

Contracts Failure to Perform Contract for Medical Services —The plaintiff physicians filed suit against the defendant on an account stated for fees for medical services From a judgment in favor of the plaintiffs, the defendant appealed to the court of appeals of Georgia, division number 2

The defendant admitted a promise to pay the amount for which suit was brought but alleged that the plaintiffs' failure to perform their obligations under a contract resulted in damage to the defendant in more than the balance of the amount due, for which reason the defendant should be relieved from liability The defendant s answer set up that the terms of the contract were that the plaintiffs agreed to give the defendant s wife prenatal care, attend the birth of the child, deliver the child, and give both mother and child post natal care for six weeks following the birth of the child, that they agreed to use the 'twilight-sleep method, the same being the use of certain drugs to render the mother unconscious of pain, such drugs to be administered when labor pains began to occur at three minute intervals that the doctor on duty when the defendant s wife entered the hospital would take charge and deliver the child

The defendant testified that his wife entered the hospital at 4 30 a m on December 21 and that Dr Grimes was on duty at that time Dr Grimes told the defendant that when birth pains occurred at three minute intervals his wife would be given paraldehyde and would thereafter suffer no further pain At 10 00 a m Dr Grimes left the hospital and Dr Fish came on duty He remained until 1 15 p m At approximately 2 00 p m the defendant s wife began suffering pains at three minute intervals, but the defendant could not find any of the clinic doctors in the hospital At about 3 50 he called at the clinic and was informed by Dr Grimes that Dr Colvin was supposed to come on duty and that he, Grimes, could not take over Colvin's case To this the defendant replied that he had contracted for four doctors and not with any one of them and he said he would try to get someone to come over, then Dr Bartholomew arrived at 4 20 and defendant met him in the hall and urged him to come to his wife s bedside, that he did so, that drugs were there after administered that the child was born at 5 38 p m , that the defendant s wife remained under the care of the clinic during the five day period she was in the hospital but that afterwards, due to the altercation the defendant engaged another doctor for the post natal treatment

From the defendant s own testimony said the court, it appears that the agreement contemplated generally that the expectant mother would receive adequate care and the pain relieving drugs, and it would seem that whether the care and drugs she actually received under the circumstances were adequate would be a matter for expert testimony of which there was none It does appear, the court continued that the defendant s wife suffered labor pains at three minute intervals between 2 00 p m and 4 20 p m , during which time no doctor was in attendance and no pain relieving drugs administered The damage alleged to have resulted from this was the pain and suffering of the wife during that period Without entering into a discussion as to whether this would be a proper subject matter for an action to which the husband only is a party it does appear that there was no guarantee that all or any given amount of pain would be relieved or that all pain would be relieved during any particular period

It is apparent from its terms that the agreement constituted an entire contract for a given price the treatment to extend from the time of the agreement until six weeks after birth So far as the testimony shows this agreement was fulfilled by the plaintiffs in so far as they were allowed to do so, for all of this period except 2½ hours on the afternoon of the child s birth It is true that the defendant's wife received only five days of the agreed six weeks post natal treatment but this was due to the defendant s action in removing his wife and child from the care of the clinic when they left the hospital The contract was entire and was not severable The defendant contended that this being so the plaintiffs cannot recover unless they have performed all of the obligations imposed upon them under the terms of the contract, and that they did not perform all of these terms in that for the 2½-hour period in question at a time when his wife most needed the services of the doctors, she did not receive them Granting, said the court, that the failure of the doctors to appear during the time in question constituted a breach of the agreement and that the defendant at that time could have refused all further services from them, procured another physician, and treated the contract as being at an end, he did not do so, but accepted the plaintiff's services at 4 20 that afternoon, through the delivery of the child, and for five days thereafter, not releasing them until after the mother had left the hospital While it is easily understandable that the defendant would not wish to employ a new physician on the very day his wife was in labor, nevertheless his conduct in retaining them throughout her subsequent stay in the hospital, and in having them proceed with a minor operation on the infant, constituted a waiver of his right to rely upon such breach for the purpose of rescinding the entire contract

No question was raised as to the reasonableness of the fee for which the plaintiff was suing and the judgment of the trial court in favor of the plaintiff physicians was therefor affirmed —*Cartwright v Bartholomew 64 S E (2d) 323 (Georgia 1951)*

MEDICAL MOTION PICTURES

Operation Blood Bank 16 mm color sound showing time 14 min. Produced in 1951 for Cutter Laboratories by Moss Film Productions San Francisco Procurable on loan from Cutter Laboratories Fourth and Parker Berkeley 10 Calif or local district offices of Cutter Laboratories

Blood transfusions have become one of the most frequently employed operative procedures in modern medicine in peace and in war, the development of the technic of storing blood in what has become known as blood banks has made this possible The need for whole blood is always acute, and the urgency becomes still greater in war and when atomic warfare threatens Blood is the only product used in medicine that cannot be manufactured and must be obtained from man All this makes it necessary to spread the information about blood banks and their operation this is what the film intends to do

After a brief introduction dealing with the donor procurement activities the audience is taken behind the scenes of a blood bank One follows the donor from the moment he enters, has a physical examination, signs a release, and has his blood examined The audience sees the technic of venipuncture, the handling of the donor, and the collection of the blood, including the extra specimens for additional laboratory tests After the blood is drawn the donor is given some refreshment, his blood is placed in the refrigerator and is then shipped from the central blood bank to branch depositories in hospitals

The various technics employed during the entire process are presented clearly and in sufficient detail to make the film a valuable educational experience for blood bank technicians nurses interns, laboratory technicians in general medical students, and physicians This film can be used to advantage for the education of lay audiences in order to interest them in blood donations It will dispel fears among lay persons and make them more amenable to respond to requests for blood This picture is well organized and the photography and narration are excellent

Recent Advances in Nutrition Review of Literature 1949 1950 G A Goldsmith and J Gibbens —p 93

Hormonal Neurogenic Vasopressor Mechanism.—Taylor and associates have previously reported two observations indicating central nervous system participation in hypertension first, the hypertensive diencephalic syndrome and, second, a pressor substance in the cerebral ventricular fluid of patients with hypertensive disease In addition, while cerebral ischemia produces a transitory and unstable *hypertension in dogs, a chronic relatively* stable form of neurogenic hypertension can be elicited by adding to the effects of cerebral ischemia prolonged *stimulation* of the floor of the fourth ventricle Recently both cerebral *baro*receptors, which alter arterial pressure in response to changes *in intracranial spinal fluid pressure, and cerebral vessel chemo*receptors, which respond homeostatically to a variety *of* vasoactive drugs, have been described The *present communication* draws attention to the existence of still another *central nervous* mechanism that acts on arterial pressure *The authors describe* cross circulation *experiments in dogs with spinal cord pithed* below the sixth cervical segment and both vagi cut in the neck On centripetal vagus stimulation, a vasopressor substance distinct from epinephrine, arterenol (nor epinephrine), renin, angiotonin and pitressin was liberated into the blood stream Its activity was enhanced by large doses of tetraethylammonium chloride and inhibited and ultimately abolished by *l* hydrazinophthalazine (C-5968) This drug also inhibits the pressor action of serotonin, the pressor and vasoconstrictor substance formed during the clotting of blood On appropriate stimulation, the brain can act as an endocrine organ that releases a pressor substance into the blood The hypotensive properties of the phthalazine derivative (C 5968) *are consistent* with this hypothesis

Morphology of Adrenal Cortex After *Administration of* ACTH and Cortisone.—The adrenals of nine patients treated with corticotrophin (ACTH) and of five treated with cortisone were studied In patients who had received corticotrophin, there was loss of lipids, hypertrophy of the zona fasciculata and zona reticularis, and, in some cases, cortical hyperplasia *The zona* glomerulosa appeared narrowed and ill-defined, but some of its cells were hypertrophic This layer may have *responded to* the hormonal stimulation by *a more rapid transformation* of its cells to the fascicular type as a means of augmenting the *secretory complex The described* morphologic pattern is believed to be similar to that observed in *patients who have been* subjected to stress The adrenal glands of patients who had *received cortisone* showed atrophy of the fascicular and *reticular* layers and broadening of the zona glomerulosa *Although* the sudanophilic material was reduced in concentration some was *still present* as intracellular globules These changes can be compared to those *seen in the adrenal glands following destruction of the* pituitary gland *This suggests* that cortisone administration induces adrenal atrophy by suppressing the secretion of corticotrophin

Epilepsy in Lupus Erythematosus.—This study was prompted by the observation of grand mal epileptic attacks in lupus patients with positive L E test reactions The authors of this paper believe that any patient with epilepsy and rheumatoid arthritis *may have* systemic lupus erythematosus A review of the literature reveals that among 144 patients with the lupus erythematosus syndrome, *there* were 22 *(15%)* who had convulsions Seven of 28 patients with positive plasma L E reactions who have been observed *at* the Cleveland Clinic since February, 1942, had convulsions. The incidence of this symptom is thus significantly greater in the series of positive L E tests than among cases observed prior to *the introduction of the plasma L. E. test Two patients had* convulsions for years prior to the appearance of recognizable symptoms of lupus erythematosus This suggests that epilepsy, when accompanied with rheumatoid arthritis or leukopenia, may constitute a prodromal symptom of systemic lupus erythematosus. *Routine electroencephalograms were made on the last* 11 *patients* of the series, abnormal patterns being noted in seven Electroencephalograms frequently revealed an organic type of dysrhythmia in patients with or without convulsions in systemic lupus erythematosus Progressive and regressive changes in the electroencephalogram were found to *parallel relapses or remissions* in this disease Routine pathological studies in four patients failed to reveal specific brain alterations in lupus erythematosus. Treatment with cortisone and corticotrophin produced improvement in epileptiform seizures related to lupus erythematosus

Coexistent Gastroduodenal and Cerebral Lesions.—In a series of 251 consecutive autopsies on infants and children Schlumberger observed one case of multiple acute gastric ulcers, two cases of gastromalacia, and seven of acute duodenal ulcer, in all these cases the gastric lesion was *associated with* cerebral damage Tuberculous meningoencephalitis was found in three of these patients, bulbar poliomyelitis in two, edema and anoxia in two, and intraventricular hemorrhage, sinus thrombosis, and microcephaly in one each The author suggests that the causal relationships between cerebral lesions and acute gastroduodenal ulcers are multiple and complex The integrating factors may be *nervous or humoral*, and perhaps oftenest both The neural mechanism is probably that suggested by Cushing i e, stimu

lation of a parasympathetic center in the diencephalon that secondarily activates cranioautonomic nuclei, especially the dorsal nucleus of the vagus The resultant autonomic imbalance produces local ischemia or hyperemia with stasis and increased capillary permeability Either of these vascular changes leads to anoxia and tissue damage with decreased resistance to the action of the gastric juice The hypothalamus also influences the motility of the gastrointestinal tract and the quantity and the quality of the digestive juices Increase in gastric hydrochloric acid or pepsin and/or a decrease in the neutralizing bile or pancreatic juice may be important in the production of gastroduodenal ulcers In conjunction with the well known neural mechanism the more recently recognized humoral responses probably play a part These patients had been subjected to sub acute or chronic stress that may have led to the liberation of large amounts of corticotrophin and corticoid hormones, which may have led in turn to increased gastric secretion and to impaired healing of the erosions initially produced by focal vascular changes

Rarity of Pelvic Endometriosis in Negro Women —The incidence of pelvic endometriosis was only 0 1% on the gynecologic service at Harlem Hospital, where nearly all patients are Negro women Uterine adenomyosis was commoner but was found in only 1 14% of laparotomies The causes of endometriosis are not known but two facts may help to explain the rarity of endometriosis in Negro women First endometriosis is rare in conjunction with pelvic inflammatory disease This has been repeatedly demonstrated by Sampson and others and is a strong argument to support his theory of pathogenesis by tubal reflux At Harlem Hospital a large percentage of patients who undergo laparotomy have severe endosalpingitis with tubal occlusion Second, it has been pointed out that the incidence of pelvic endometriosis is low in ward patients as compared with private patients This is attributed to earlier marriage and childbearing in the ward patients and this factor probably applies also to the Negro women A constitutional racial factor may also be involved

Cross Circulation in Leukemia —The elevated leucocyte count in leukemia may be due to increased production of white blood cells in the hematopoietic tissues or decreased removal of white cells from the circulating blood by the capillaries of the lung Leukemic leucocytes infused intravenously into nonleukemic subjects are promptly and almost completely removed from the circulating blood by the lungs of the recipient To study this phenomenon more fully the authors performed cross transfusions between leukemic and nonleukemic patients They describe the methods used for vein to-vein artery-to artery, and artery to vein transfusions and conclude that the interarterial method is most satisfactory for investigation of the pulmonary leucocyte removal mechanism In one child with lymphogenous leukemia there was a pronounced decrease in the leucocyte count after each of three cross transfusions and a moribund state was succeeded by a transient remission of one month s duration after the first transfusion In another patient with lymphogenous leukemia an impairment in the pulmonary removal mechan ism was demonstrated by the finding of numerous myeloid cells in the arterial blood after an intravenous transfusion of myelogenous blood An excessive leucocyte removal mechanism was demonstrated in a patient with subleukemic lymphogenous leukemia Equalization of the number of circulating leucocytes in a leukemic and a nonleukemic patient was not achieved even after a 26 hour cross transfusion, during which 150 liters of blood were exchanged There was no evidence even at autopsy of the transmission of leukemia to the nonleukemic patients, most of whom had incurable malignant lesions

Rh Negative Child and Rh Antibody Titer—The Rh antibody titer was studied during pregnancy and after delivery in 11 cases in which previously sensitized Rh negative mothers had Rh-negative babies In addition, one case was studied in which a type Rh_1 mother, previously sensitized to the rh" factor, gave birth to a type Rh_1 baby In all cases the babies were normal at birth and the baby's serum contained univalent Rh antibodies equal in titer to those present in the maternal serum In no case was there a rise in the antibody titer in the maternal serum either during the pregnancy or after the baby was born Thus, it has not been possible to confirm claims concerning a 'nonspecific anamnestic rise" in Rh antibody titer, said to be caused by an Rh-negative baby In one of two cases described in detail, there was no appreciable change in Rh antibody titer during the pregnancy, despite the use of so-called Rh hapten, nor had there been an appreciable change in titer for as long as two and one-half years previously The Rh antibody titer of the baby s blood dropped about 98% by the end of the sixth month, while during the same period of time the maternal antibody titer fell only approximately 35% From the course of the Rh antibody titer of the baby's serum, the half-life of the antibody globulin molecule is estimated to be about 30 days

Vertebral Venous System and Metastases to Spinal Column—Experiments were designed to determine whether embolic tumor cells introduced into the femoral vein could pass directly to the lumbar vertebrae by way of the vertebral veins, by passing the lungs If such were found to be the case, then, as suggested by Batson, the spontaneous metastases of pelvic tumors to the lumbar spine in man might be accounted for without the assumption that the embolic cells pass through the capillaries of the lung to be distributed by the arterial circulation Tumor-cell suspensions were injected into the femoral veins of rats and rabbits while slight abdominal pressure was applied At autopsy, tumor foci were found in the vertebral venous system of 12 out of 14 rats and of four out of seven rabbits Most of these tumor foci were found in the lumbar vertebrae, but one each was found in the spinal cord, the venae vasorum of the femoral vessels, and the choroid plexus of the brain No foci were found in arterioles, where one would expect them to appear if the cells had entered the arterial circulation by traversing the pulmonary blood channels Cells injected without accompanying abdominal compression resulted, with only one exception, in the appearance of tumors in the lungs only, again indicating failure of the cells to pass through the lung capillaries. These observations are in accord with the concept that the frequency of spontaneous tumor metastases to the vertebral column from pelvic tumors in man depends on the entrance of tumor-cell emboli directly into the vertebral venous system, by passing the lungs

Ammonium Chloride Acidosis.—The occurrence of acidosis is reported in six patients following the administration of 6 to 8 gm of enteric-coated ammonium chloride daily for seven to 45 days The acidosis was severe in four patients and nearly fatal in two Five patients had congestive heart failure and various types of intrinsic renal disease The remaining patient had subacute glomerulonephritis and anasarca Clinical manifestations ranged from anorexia, nausea and vomiting with lassitude, to marked stupor, areflexia, and Kussmaul respiration In all patients rapid improvement followed omission of ammonium chloride and intravenous administration of fluids and lactate No close relationship between the degree of congestive heart failure, the amount of drug administered, or the severity of acidosis was noted In three of the patients with congestive heart failure pronounced azotemia developed The severe acidosis is believed to be related to intrinsic renal disease and the inability of the kidneys to prevent continued loss through the urine of fixed base with chloride The elevated plasma chloride concentrations observed in ammonium chloride acidosis are related to continued intake of chloride, increased tubular reabsorption of chlorides, and, in part dehydration resulting from pronounced water loss Decrease in urea clearance and a rise in nonprotein nitrogen were considered as further effects of acidosis in four patients Two patients had severe anemia, which is known to be associated with decreased renal blood flow, but sufficient data are lacking to assess the role of the anemia in the production of acidosis Ammonium chloride is a valuable adjunct in the management of congestive heart failure but should be used with great caution when renal disease is suspected or present It is suggested that the administration of ammonium chloride be limited to three consecutive days per week When longer periods of administration are necessary, careful observation of the patient and measurement of the blood carbon dioxide combining power are indicated

Plasma Cholesterol Levels During Rapid Weight Reduction — Twenty seven obese patients were placed on reducing diets of 600 or 800 calories daily after their weights had been recorded and the fasting plasma cholesterol level had been ascertained Forty plasma cholesterol determinations were made during the period of rapid weight reduction, 27 were lower, and 30 higher than earlier control levels There seemed to be no significant increase or decrease in cholesterol levels during the first two weeks of weight reduction Determinations taken during the third week averaged 32 5 mg per 100 cc lower than control values Patients undergoing most rapid weight loss showed the greatest drop in plasma cholesterol The diet offered to the patients was extremely low in fat and relatively high in protein and bulk Many fears concerning rapid weight reduction have been based on the concept that weight reduction would cause increased fat mobilization, with consequent elevation of blood cholesterol since it is one of the chief vehicles for fat transport Results in these patients indicated that fear of elevating the plasma cholesterol need not deter the physician from subjecting obese patients to rapid weight reduction

*Mesenteric Vascular Occlusion. C. J Dougherty —p 125

Mesenteric Vascular Occlusion.—The symptomatology of the patient here discussed resembled that of acute appendicitis The symptoms did not include the sudden severe abdominal pain with shock and collapse seen in a complete occlusion of a large mesenteric vessel with extensive devitalization of bowel The pain was at first diffuse throughout the abdomen Nausea was present, but vomiting was minimal, and the pain did not become severe until the day of admission Laboratory studies indicated an infectious process, there was a high white cell count, and the urinary findings could be interpreted as the reaction of the kidneys to the toxemia Serum amylase studies were not done prior to the emergency laparotomy, because the site of the tenderness and rigidity did not suggest acute pancreatitis Mesenteric occlusion, a volvulus of the cecum or small bowel, and perforated Meckel s diverticulum could have been considered preoperatively as possibilities but the commoner diseases are usually thought of in the presence of acute abdominal symptoms The gangrenous portions of the terminal ileum and cecum were resected, and a temporary ileostomy was made After the intestinal continuity was reestablished in a second operation, the patient recovered from this often fatal disease

Hemodynamics in Bulbar Conjunctiva in Hypertension — Studies were made on the conjunctival capillary vessels of subjects with hypertensive vascular disease The bulbar conjunctiva in each eye was examined with a slit lamp microscope in a manner similar to that used in routine ophthalmological practice The general state of the capillary bed was noted (i e, ischemic, plethoric, or euvascular) In certain cases, the velocity of blood flow was measured in the metarterioles capillaries, and collecting venules The capillary bed and its reactions in the conjunctiva of normotensive subjects had been previously described When all criteria selected for evaluation were considered together, an over all pattern emerged of certain peripheral vascular abnormalities in hypertension The total pattern was not found in the normotensive controls However, no one feature selected for study could be correlated absolutely with the age of the patient the degree of blood pressure elevation symptomatology or the duration of the illness The abnormal hemodynamics observed in the conjunctival peripheral circulation in essential hypertension consisted of (1) metarteriolar narrowing (2) augmented spontaneous vasomotor activity in precapillary sphincters, and (3) coiling, looping, and tortuosity of many vessels There was also a heightened sensitivity of metarterioles and precapillaries to topically applied epinephrine and a reduced velocity of peripheral blood flow These features are generally in accord with those that have been described for similar vessels in the splanchnic area of animals with experimental renal hypertension The conjunctival peripheral vessels of four normotensive subjects who had had an apparently spontaneous remission of previous hypertension displayed the same phenomena found in the conjunctival vascular bed of patients with sustained hypertension

Subcutaneous Injection of Mumps Virus Vaccines.—A large part of the studies reported here were carried out in Southeastern Alaska, where there had been no major epidemic of mumps for over eight years Consequently, it was expected to find many persons in older age ranges who never had been exposed to mumps and thus the antibody response in truly susceptible individuals could be studied The serological response of human beings to subcutaneous vaccination with inactivated mumps virus, as measured by complement fixation and hemagglutination inhibition tests, was studied Maximal complement fixing antibody response was obtained two to three weeks after vaccination A single injection of vaccine resulted in antibody responses indistinguishable from those recorded after two injections two weeks apart The frequency of response, as well as the height of titers attained, depended on the amount of vaccine injected Only with 4 ml of vaccine, representing approximately a 20-fold concentrate of virus from allantoic fluid, did all susceptible persons show some antibody response A correlation between the antibody titers obtained by the virus antigen complement-fixation test and those obtained by the hemagglutination inhibition reaction, indicated that the two techniques probably measure different antibodies Although, in general, a high titer by one test was matched by a high antibody level in the other, the ratios of hemagglutination inhibition to complement-fixation titers varied over a range far greater than could be ascribed to the variations inherent in the techniques An epidemic of mumps occurred nine to 12 months after vaccination. The incidence of infection among the controls (63 cases in 193) was almost twice that encountered in the immunized group (46 cases in 250) This result gained in significance when the incidence of mumps in the vaccinated group was correlated with the antibody levels attained four to five weeks after vaccination The incidence was highest in those who failed to respond with measurable antibodies to vaccination and decreased markedly with the increase in the antibody level attained after immunization The data indicate that transitory immunity may be induced by subcutaneous vaccination with inactivated mumps virus and that its duration seems to be related to the height of antibody levels attained

Oral Spraying of Mumps Virus.—Studies on the response of human beings to oral spraying of attenuated active mumps virus revealed that among 410 children judged susceptible by negative histories and serological tests, six showed mild signs of infection Up to 93% of the children responded with antibodies as measured by the complement fixation technique The frequency of response depended on the concentration of virus used. Hemagglutination-inhibition tests in a small number of cases revealed formation of antibodies in 60% In most instances the serological tests were negative one year after the spraying However, following skin testing at that time, the antibody response was greater in these children than in comparable control subjects Experimental exposure of four children to mumps virus three months after immunization failed to produce the disease, whereas in four out of six controls clinical evidence of mumps developed Of the larger groups treated by this procedure only those in one institution had been definitely exposed to mumps eight months later Eight cases occurred among the nonimmunized children, mainly new admissions to the school Although these data permit no conclusion, they justify further exploration of this method of active immunization

Myoepithelial Hamartoma of Stomach Wall.—This case concerns a man, 47, with pain in the epigastric region of two years' duration, not related to the ingestion of food but aggravated by alcoholic beverages Roentgenograms taken at the onset of the disease revealed no abnormality, but a second roentgen examination shortly before the patient's admission to the hospital showed a filling defect in the antral portion of the stomach Physical and laboratory examinations gave no definite information Subtotal gastric resection permitted the removal of a mass in the antral portion of the stomach On section this mass showed islands of pancreatic acini and many ductlike structures The final diagnosis was myoepithelial hamartoma of the stomach The exact cause of the lesion is not known The fact that accurate diagnosis can never be reached except by microscopic examination of tissue obtained either at operation or autopsy makes it imperative for the general practitioner to be aware of the possibility of "aberrant pancreas' as a cause of some obscure gastrointestinal manifestations that cannot be readily classified

Trichomonas Vaginitis—Of 325 patients with Trichomonas vaginalis vaginitis, 158 were treated by nightly insertion in the vagina of capsules of 4 gm of argypulvis® (finely powdered mild silver protein [argyrol®] kaolin, and lactose) and 194 were given capsules containing 2 gm of argypulvis® The capsules were inserted in the vagina after a preliminary douche with four tablespoonfuls of white vinegar in two quarts of warm water to make certain that there was adequate moisture The treatment proved effective in all but five patients Three of the failures occurred in the group who had received 4 gm argypulvis® capsules, and in two of those who received 2 gm capsules Thus the 2 gm dose was as effective as the 4 gm dose. Three and probably four of the therapeutic failures were associated with a history of recent supracervical hysterectomy It is possible that a resistant trichomonad focus was created in the persisting cervical stump All the failures occurred in patients between 25 and 39, with a vaginal pH below 6 at the start of therapy Simple correction of the vaginal pH to normal may not be relied on to eliminate the trichomonal infection, since the vaginal pH was within the normal range in some of the most resistant of the authors' cases Some recurrences were observed after 17 to 42 weeks, over which the patients remained Trichomonas negative. There can be no doubt that the marriage partner contributes to this type of recurrence several instances of trichomonads in the male were observed in the prostatic secretion the urine, or the seminal fluid Complete success in the treatment of Trichomonas vaginitis can be obtained only through complete awareness of all the factors contributing to its persistence and recurrence

Viruses of Epidemic Keratoconjunctivitis and St Louis Encephalomyelitis.—Ruchman's studies indicate that it is impossible at present to distinguish epidemic keratoconjunctivitis virus from St Louis encephalitis virus by means of the intracerebral neutralization test in mice The serums from animals convalescing from epidemic keratoconjunctivitis and from St Louis encephalitis neutralized epidemic keratoconjunctivitis and St. Louis encephalitis viruses equally No differences could be elicited by neutralization tests with the keratoconjunctivitis virus that had been through three successive rabbit passages Neutralization tests in which serum dilutions were used against a constant amount of virus also failed to show differences between the two viruses Significant cross neutralization was obtained with the related Japanese B and West Nile viruses Infectivity tests in animals revealed that rabbits and guinea pigs were susceptible to intracerebral inoculation with keratoconjunctivitis virus but not to St Louis virus. The studies described by Cheever give evidence confirming Ruchman's observations that the viruses of St Louis encephalitis and epidemic keratoconjunctivitis are closely related He stresses the importance of careful study of current outbreaks of epidemic keratoconjunctivitis as a means of assessing the significance of these findings

Depression of Fecal Urobilinogen by Aureomycin and Terramycin—Robbins shows that the oral administration of aureomycin or terramycin to man results in an extremely low concentration of fecal urobilinogen This change occurs during the first 48 to 72 hours of therapy, concurrently with other modifications in the intestinal contents Normal concentrations of urobilinogen may not be restored for six or seven days after the discontinuance of drug administration The depression of urobilinogen formation is probably the result of alterations in the flora of the intestine A case of hemolytic anemia is reported in which strikingly low fecal and urinary urobilinogen concentrations were observed while the patient was receiving aureomycin

Subcutaneous Injection of Mumps Virus Vaccines.—A large part of the studies reported here were carried out in Southeastern Alaska, where there had been no major epidemic of mumps for over eight years Consequently, it was expected to find many persons in older age ranges who never had been exposed to mumps and thus the antibody response in truly susceptible individuals could be studied The serological response of human beings to subcutaneous vaccination with inactivated mumps virus, as measured by complement fixation and hemagglutination inhibition tests, was studied Maximal complement fixing antibody response was obtained two to three weeks after vaccination A single injection of vaccine resulted in antibody responses indistinguishable from those recorded after two injections two weeks apart The frequency of response as well as the height of titers attained, depended on the amount of vaccine injected Only with 4 ml of vaccine, representing approximately a 20 fold concentrate of virus from allantoic fluid, did all susceptible persons show some antibody response A correlation between the antibody titers obtained by the virus antigen complement fixation test and those obtained by the hemagglutination inhibition reaction, indicated that the two techniques probably measure different antibodies Although, in general, a high titer by one test was matched by a high antibody level in the other, the ratios of hemagglutination inhibition to complement-fixation titers varied over a range far greater than could be ascribed to the variations inherent in the techniques An epidemic of mumps occurred nine to 12 months after vaccination. The incidence of infection among the controls (63 cases in 193) was almost twice that encountered in the immunized group (46 cases in 250) This result gained in significance when the incidence of mumps in the vaccinated group was correlated with the antibody levels attained four to five weeks after vaccination The incidence was highest in those who failed to respond with measurable antibodies to vaccination and decreased markedly with the increase in the antibody level attained after immunization The data indicate that transitory immunity may be induced by subcutaneous vaccination with inactivated mumps virus and that its duration seems to be related to the height of antibody levels attained

Oral Spraying of Mumps Virus—Studies on the response of human beings to oral spraying of attenuated active mumps virus revealed that among 410 children judged susceptible by negative histories and serological tests, six showed mild signs of infection Up to 93% of the children responded with antibodies as measured by the complement-fixation technique The frequency of response depended on the concentration of virus used. Hemagglutination inhibition tests in a small number of cases revealed formation of antibodies in 60% In most instances the serological tests were negative one year after the spraying However, following skin testing at that time, the antibody response was greater in these children than in comparable control subjects Experimental exposure of four children to mumps virus three months after immunization failed to produce the disease, whereas in four out of six controls clinical evidence of mumps developed Of the larger groups treated by this procedure only those in one institution had been definitely exposed to mumps eight months later Eight cases occurred among the nonimmunized children, mainly new admissions to the school Although these data permit no conclusion, they justify further exploration of this method of active immunization

Myoepithelial Hamartoma of Stomach Wall.—This case concerns a man, 47, with pain in the epigastric region of two years' duration, not related to the ingestion of food but aggravated by alcoholic beverages Roentgenograms taken at the onset of the disease revealed no abnormality, but a second roentgen examination shortly before the patient's admission to the hospital showed a filling defect in the antral portion of the stomach Physical and laboratory examinations gave no definite information Subtotal gastric resection permitted the removal of a mass in the antral portion of the stomach On section this mass showed islands of pancreatic acini and many ductlike structures The final diagnosis was myoepithelial hamartoma of the stomach The exact cause of the lesion is not known The fact that accurate diagnosis can never be reached except by microscopic examination of tissue obtained either at operation or autopsy makes it imperative for the general practitioner to be aware of the possibility of 'aberrant pancreas as a cause of some obscure gastrointestinal manifestations that cannot be readily classified

Trichomonas Vaginitis.—Of 325 patients with Trichomonas vaginalis vaginitis, 158 were treated by nightly insertion in the vagina of capsules of 4 gm of argypulvis® (finely powdered mild silver protein [argyrol®], kaolin and lactose) and 194 were given capsules containing 2 gm of argypulvis® The capsules were inserted in the vagina after a preliminary douche with four tablespoonfuls of white vinegar in two quarts of warm water to make certain that there was adequate moisture The treatment proved effective in all but five patients Three of the failures occurred in the group who had received 4 gm argypulvis® capsules, and in two of those who received 2 gm capsules Thus the 2 gm dose was as effective as the 4 gm dose. Three and probably four of the therapeutic failures were associated with a history of recent supracervical hysterectomy It is possible that a resistant trichomonad focus was created in the persisting cervical stump All the failures occurred in patients between 25 and 39, with a vaginal pH below 6 at the start of therapy Simple correction of the vaginal pH to normal may not be relied on to eliminate the trichomonal infection since the vaginal pH was within the normal range in some of the most resistant of the authors cases Some recurrences were observed after 17 to 42 weeks, over which the patients remained Trichomonas negative. There can be no doubt that the marriage partner contributes to this type of recurrence several instances of trichomonads in the male were observed in the prostatic secretion the urine, or the seminal fluid Complete success in the treatment of Trichomonas vaginitis can be obtained only through complete awareness of all the factors contributing to its persistence and recurrence

Anaphylactic Shock from Wasp Stings—Williams reviews the literature on severe general and fatal reactions due to anaphylaxis from bee and wasp stings and presents the case of a man who had been stung on the left hand and forearm by six or seven wasps He began to "itch all over," became extremely weak and nervous, frothed at the mouth," and collapsed within 15 minutes after the stings On admission to the hospital he was cyanotic and covered with perspiration and his blood pressure could not be obtained or pulsations felt at the wrist There was tachycardia Breathing was rapid, shallow, and stertorous, and the general appearance was that of a patient with a cerebrovascular accident The man was immediately given 1 cc of epinephrine subcutaneously, then 50 mg of diphenhydramine (benadryl®) hydrochloride intravenously Administration of oxygen by mask was started, followed by intravenously administered glucose in saline solution and blood This treatment caused a slight improvement, in that the blood pressure could be registered The patient was irrational and violent and had to be restrained, he was given amobarbital (amytal®) sodium and morphine and scopolamine On the fourth day the patient still required oxygen as well as restraints and sedation Then cortisone was started in 100 mg doses at eight hour intervals for three doses After this, great improvement could be seen It is believed that the cortisone was life saving, but it is also suggested that the patient might have responded more promptly had more epinephrine been given The use of epinephrine in adequate doses, antihistaminic agents, and general shock-combating measures is recommended as immediate first aid, to be followed by cortisone or preferably, corticotrophin in cases of anaphylaxis

Hyaluronidase in Chronic Ulcers.—Since one of the causes of chronic ulcers is inadequate nutrition to the tissues, Ende felt that hyaluronidase might facilitate passage of necessary agents into an ulcerated area and thereby promote healing The first patient in whom hyaluronidase was used was a man, 25, who in childhood had had osteomyelitis in the left leg In June, 1950, an ulcer developed 3 in (7 62 cm) by 1¾ in (4 45 cm) and approximately ¼ in (0 64 cm) in depth The patient was treated for several months with penicillin and local applications He was then put on bed rest, and penicillin was continued for 10 days The ulcer did not heal Penicillin was stopped, and bed rest continued One ampule of 400 viscosity units of hyaluronidase dissolved in 1 cc of water was applied to the lesion daily The patient noted significant relief of pain in 24 hours Within one week the ulcer was approximately half its original size, and it healed in three weeks The second patient was a woman, 65, who had had leg ulcers for 40 years One ulcer covered an area 5½ in (13 97 cm) by 4½ in (11 43 cm), a smaller one measured 1 in (2 54 cm) by 1½ in (3 31 cm) This smaller ulcer healed under treatment with hyaluronidase in four weeks, the larger ulcer was reduced in size and granulated to the level of the skin in two and one half months It is ready for skin grafting Similar favorable results were obtained in a third patient. All three had rapid diminution in pain Ende feels that further investigation of the use of the drug in wound healing is indicated

Alcohol Barbiturate Synergism —Sandberg s studies demonstrate that small, subhypnotic doses of several short acting barbiturates produce a marked potentiation of the effect of alcohol measured by the diminished induction time of anesthesia The degree of potentiation varied with the dose and the type of barbiturate derivative Hexobarbital was found to produce the highest degree of synergism followed by 1-carbethoxymethyl-5, 5-diallylbarbituric acid, amobarbital, thiopental and cyclobarbital A test has been developed for the analysis of the differences in the degree of potentiation No correlation is found between the degree of potentiation and hypnotic efficiency or induction time Sandberg believes that discrepancies between his observations and those of observers who noted a retarding effect of alcohol on the anesthesia induced by barbiturates may be due to the differences between short acting and long acting barbiturates The clinical use of the combination of alcohol and a short acting barbiturate was reported by Rachek in 1945, who stated that the synergistic action of alcohol and hexobarbital has been utilized to advantage in intravenous anesthesia The present investigation indicates that a potentiative, not a simple additive, type of synergism exists between alcohol and the short-acting barbiturates and that the degree of potentiation varies with the dose and the type of the barbiturate derivative

Antihistamine Treatment of Acute Nephritis —Since most cases of acute nephritis follow a bacterial usually a streptococcic infection by one to three weeks it has been widely accepted that immunity responses are involved in the pathogenesis of the disease The known mediation of histamine or a histaminelike substance as a final common path in the production of a variety of hypersensitivity phenomena suggested a trial of one of the recently developed antihistamine drugs in the treatment of acute nephritis Some investigators obtained encouraging results with pyranisamine maleate ("anthisan) in the treatment of eight cases of acute nephritis Lawson tried this drug in the treatment of 33 consecutive cases of acute nephritis, alternate patients being treated with an antihistamine drug for 10 days Cases were followed for from six and 18 months This is a report on the first six months experience, during which period every child except one recovered completely Analysis of the total duration of activity shows that the patients treated with pyranisamine were consistently slightly slower in recovering. The report did not confirm the value of this agent in the management of acute nephritis Lawson feels that in a series like this, in which every child but one recovered within a few weeks or months it is not possible to study the effect of the drug on the long term prognosis

Idiosyncrasy to Aureomycin —The patient showed sensitivity to acetylsalicylic acid (nausea, vomiting and urticaria) and penicillin (eczematous dermatitis) Despite the known sensitivity to penicillin, he had been given 1,500,000 units of penicillin, under a heavy umbrella of antihistaminics and ephedrine, for cellulitis of the face About four weeks later he was given 1 gm of aureomycin by mouth for influenza with fever and a cough productive of purulent sputum Ten minutes later he noticed itching of the groin and between the outer toes of both feet sites which had been infected with ringworm some years previously Two to three minutes afterward dyspnea developed, accompanied by stridor and cyanosis The eyes protruded and the face became purple A crowing inspiration ended the inspiratory difficulty, which was succeeded by a typical asthmatic attack that subsided spontaneously after two hours Edema (a confluent urticaria) of the scrotum, hands, feet, and face reached maximum about two hours afterward and slowly subsided about 36 hours later The view that this alarming episode was due to aureomycin was strengthened by a strongly positive skin test There is possibly an antigenic relationship between the products of growth of various molds and fungi Though they may be uncommon, severe reactions to the newer antibiotics should be anticipated, particularly in persons known to be sensitive to penicillin

*Treatment of Metastases of Lung A Victorica —p 52
*BCG Test in Children who Received BCG Vaccination at Birth R Gorlero Bacigalupi —p 60

Treatment of Metastases of Lung.—According to Victorica, tumors that most frequently metastasize to the lung are, in order of frequency, carcinoma, sarcoma, chorionepithelioma, and tumors of the uterus, ovaries, and testicles Symptoms of pulmonary metastases are the same as those of primary cancer of the lung The roentgen aspects of the metastases are those of miliary nodules or of round or oval shadows Biopsy and aspiration of bronchial secretion for identification of neoplastic cells are of diagnostic value Pulmonary lobectomy is indicated when the metastases are solitary, when the primary tumor has been removed and the biopsy near the primary foci is negative for cancer, and when the general condition of the patient is satisfactory and the operation as planned, should not greatly impair respiration A patient is reported on whose left hand was amputated at its lower third because of sarcoma of the hand Upper left lobe lobectomy was performed 20 months later for a single large metastasis of the lobe The two carcinomas, that of the hand and of the lung, were of the same histological type The patient is in good health and able to work six months after the operation

BCG Test —Gorlero Bacigalupi observed 770 children, of ages from birth to the age of 10 years who had had BCG vaccination at birth by the Rosenthal multipuncture technique Skin puncture tests were made simultaneously in both forearms through a drop of old tuberculin in one forearm and a drop of BCG vaccine in the other Results, which were read 72 or 96 hours later, were positive with the BCG test in 701 cases (91 03%) and with the tuberculin test in 484 cases (62 85%) The hypoergic type of reaction was the same with either test The percentage of positive reactions after vaccination increases from birth up to the age of 3 years and then gradually diminishes The author concludes that with the BCG test there is a higher percentage of positivity and that, although the hypoergic responses predominate with both techniques, the responses to the BCG give a higher percentage of papules between 6 and 10 mm in diameter The results of these observations indicate the need to revaccinate children about three years after the first vaccination

Polyarteritis Nodosa and Rheumatic Diseases.—Pagel tries to clarify the following points (1) the early changes in polyarteritis nodosa and the question of the so-called fibrinoid substance, (2) some histological criteria reputed to distinguish polyarteritis nodosa from the rheumatic and pararheumatic' diseases, including 'temporal arteritis", (3) polyarteritis nodosa as the basis of Loffler's syndrome associated with dermatoses, and (4) the causal role of bacterial hypersensitivity in polyarteritis nodosa The studies reported were made on 18 cases The early changes appear to be subendothelial swelling due to permeation of fluid, followed by fibrinogen exudation and necrosis of the vascular wall A breach in the latter may be plugged by fibrin, or fibrin may be found both inside and outside the breached and necrotic vascular wall Polyarteritis nodosa differs from the rheumatic and 'pararheumatic" diseases (lupus erythematosus disseminatus, dermatomyositis, arteriolitis allergica, temporal arteritis) in its course and in the site and distribution of the lesions, but the basic histological change appears to be identical in all In polyarteritis nodosa, fibrin deposition and necrosis affect the vascular walls mainly, but extramural foci may occur and involve the collagen fibers, with lesions indistinguishable from the acute "infiltrative' changes in rheumatic fever, lupus erythematosus disseminatus, and dermatomyositis There is preservation of the argyrophil reticulin within the zone of collagen change In addition to these paravascular foci, pseudotuberculous necrotic lesions may occur in polyarteritis nodosa Finally, a granuloma resembling the Aschoff nodule and the changes seen in temporal arteritis may develop in the vascular wall On the other hand, rheumatic arteritis, as seen in rheumatic fever, may be indistinguishable from polyarteritis nodosa and the vascular changes observed in dermatomyositis and scleroderma Two cases are described of eosinophilic alveolitis in association with exfoliative dermatitis and asthma In both there is evidence of burnt-out polyarteritis nodosa and of a dissociation" of eosinophilia and arterial necrosis The events that lead to the explosive arterial lesion of polyarteritis nodosa indicate a hyperergy This hypersensitivity, which may involve a foreign or modified serum, or an abnormal protein, is comparable to the Arthus phenomenon and the type generally referred to as the anaphylactic type of allergy, but it may be due to a bacterial antigen, as shown by the use of streptococci in experiments on human volunteers

Intimal Vascularization and Atherosclerosis—Geiringer reviews the history of the study of atherosclerosis, giving particular attention to intimal vascularization and thrombogenic atherosclerosis. The material for his study was derived from routine autopsies at the Royal Infirmary in Edinburgh and consisted of 300 aortas taken in their entirety and sections from 100 hearts, including the first inch of the anterior descending branch of the left coronary artery He stresses the following points 1 The normal arterial intima is an avascular structure 2 It acquires a secondary blood supply if it grows beyond a certain critical thickness 3 This critical thickness, which varies with each artery, is about 0 5 mm in the aorta and 0 35 mm in the proximal part of the anterior descending branch of the left coronary 4 Intimal vascularization occurs either through an extension of the adventitial plexus into and through the media or by retention of the vascular network of organizing mural thrombi When both processes occur *in the same vessel, anastomoses usually form* 5 This adventitious blood supply of the intima is liable to interference, and most of the clinical effects of atherosclerosis can be traced to the resulting ischemic necrosis of the intima Living atherosclerotic thickenings are rarely a source of trouble The vast majority *of vascular accidents* due to atherosclerosis occur in relation to necrotic plaques, and intimal vascularization is the forerunner of intimal necrosis

Erysipeloid of Rosenbach—Erysipelothrix rhusiopathiae gives rise to three *forms* of infection in *man* (1) a mild, localized cutaneous infection, (2) a diffuse or generalized cutaneous eruption with constitutional *symptoms, and* (3) a septicemic form All of the 30 cases here reviewed fell into the first group They were observed in the course of 10 months (1949/1950) at St. Thomas Hospital in London The part infected was the hand or fingers The patients described a sensation of superficial itching or smarting, *coupled with a feeling* of tightness and stiffness of the under lying joints The lesion was an erythematous patch spreading from the site of inoculation, varying from pink to deep purple, with a fairly distinct raised margin, and hot but not acutely tender Three patients had systemic disturbances, with fever and malaise, and in one case, vomiting All the patients were outpatients No local application was given, but 28 patients were treated with the systemic administration of aqueous penicillin in doses of 200,000 or 500,000 units once or twice a day The two patients who refused penicillin injections were left untreated, and the lesions resolved spontaneously, the first in 10 days and the second in 14 Of the 28 patients treated with penicillin, 20 were cured after one course of penicillin, with total doses of from 800,000 to 2,200 000 units being given in from two to five and one half days Lesions recurred in six patients after a course of penicillin lasting two or three days with a dosage of 200,000 units twice a day Two patients did not return after the second or the third injection It appears that penicillin therapy should be continued until the lesion desquamates

Delayed Effects of Ultraviolet Burns.—It has been shown that after exposure to ultraviolet radiation there may be a reduction in sweating-rate, which is partly caused by occlusion of sweat gland ducts in the necrosed surface layer of the epidermis and probably partly by reduction of secretory pressure of sweat Thomson reports collapse in two men, apparently attributable to previous ultraviolet radiation, and the development of sun blisters in another case The two men had been acclimatized by 14 days of exposure to heat, working and resting intermittently according to the same routine for four hours in a climatic chamber The men collapsed in a heated room a day after receiving ultraviolet burns, one from the sun, and the other from an ultraviolet lamp They had withstood the environmental conditions (effective temperature 91 F) on control days without undue hardship The author says that two kinds of blisters may develop after ultraviolet burn The more important type arises between the dermis and the epidermis within 48 hours of injury, contains a plasmalike exudate, and should be treated like thermal second-degree burns The second type (sudamina) arises superficially in the corneum from the second day on after injury, contains sweat, and requires no treatment

Some Observations on Poliomyelitis Epidemic at Stanthorpe Queensland 1951 R. L. Green —p 659

Syndrome of Gout.—McQueen advances the concept of "syndrome of gout," suggesting that the causes of gout are numerous and that the secondary effects of elevated blood uric acid, essential for the syndrome of gout, are manifold The tendency toward high uric acid level is usually hereditary, the gene determining the condition being an autosomal dominant which is obscured by endocrine factors in women during the child-bearing period The mode of action of this hereditary abnormality is still not proved, but circumstantial evidence suggests that it acts through the kidney in diminishing excretion of urates One important acquired cause of high uric acid level is excess production of uric acid Diseases of blood may be accompanied by a very high level of uric acid On numerous occasions gout has been reported in association with erythremia, pernicious anemia, and hemolytic anemia The other important cause of elevated uric acid level is renal deficiency, which, when sufficiently far advanced causes retention of uric acid Of 65 patients, 58 men and seven women, reported on by the author, 38 are considered to have had renal disease, as shown by urea retention, consistent albuminuria, or albuminuria with urinary deposit of red blood cells and casts Arteriolar nephrosclerosis is the lesion most consistently recorded in gout Many resemblances can be seen between the Kimmelstiel-Wilson syndrome and gouty renal disease, and it is suggested that elevated uric acid is a stress producing agent The prodrome of an acute attack of gout (increased electrolyte excretion) suggests temporary inadequacy of adrenal cortical secretion, as does the immediate relief of the acute attack by the administration of corticotrophin (ACTH) and cortisone

Hemorrhagic Conditions Connected with Thromboplastin Complex.—Seven patients, five males between 5 and 15, one woman 44, and one man 75, with hemorrhagic tendencies are reported Of the five male children, two were hemophiliacs with a positive family history Hemophilia is defined as a congenital deficiency disease due to lack of a plasma soluble precursor of thromboplastin If one assumes this concept to be correct, the laboratory diagnosis of hemophilia can be made by the following three tests 1 Determination of the whole blood coagulation time Delay indicates that the hemorrhagic tendency is due to intravascular causes 2. Determination of the plasma coagulation time with a series of dilutions of brain extract This test indicates deficiency in the thromboplastin complex 3 Determination of the plasma coagulation time with a mixture of patient s and normal plasma This test indicates whether the condition is due to lack of thromboplastin or is caused by an inhibitor According to clinical symptoms and results of laboratory tests two of the young male patients were true hemophiliacs, but there was no family history of bleeding Other workers have also reported male "bleeders" with a hemophilic defect without a family history of disease An acquired hemorrhagic condition occurring in both sexes and simulating hemophilia was found in the authors two adult patients The presence of thromboplastin antagonists could be verified It is known that the patients had acquired the hemorrhagic condition prior to blood transfusion Iso immunization against the antihemophilic globulin or against the thromboplastin has been considered However, antibodies reacting with normal plasma components were not detectable in the patients' plasma The source of the anticoagulant could not be established

Aureomycin in Inoculation Vaccinia—A woman, 25 had been subject to eczema since the age of 10 The present disorder began with the appearance of some pustules around the mouth, to which the patient applied boric acid ointment and alcohol A physician injected calcium and prescribed an ointment, but despite this treatment the skin lesions advanced so rapidly that hospitalization became necessary Face, neck, and chest were covered with pustules and yellowish crusts and the face was edematous So far as the patient knew, she had not been in contact with newly vaccinated children, but the eruption occurred at a time when many children were being revaccinated This fact, the nature of the cutaneous lesions, and the demonstration of Paschen s inclusion bodies justified the diagnosis of inoculation vaccinia The cutaneous lesions and fever subsided rapidly with aureomycin therapy

Prognosis in Erythrodermia and in Generalized Dermatoses J W H Mali —p 1675
*Pulmonary Disorders Caused by Molds P J van der Werff —p 1682.
*Treatment of Symptomatic Psychosis with Antallergan (Antihistamine Preparation) F J Tolsma —p 1690

Pulmonary Lesions Caused by Molds.—A patient was hospitalized with a diagnosis of asthma and chronic bronchitis His first severe attack had come on during the harvesting of rye His general condition remained favorable but then he declined rapidly The Pirquet and Mantoux tests were negative, and sputum examination yielded no tubercle bacilli but did reveal Staphylococcus aureus and Neisseria organisms as well as spores of molds Pulmonary carcinoma was considered Attempts to counteract the bronchobacterial factors by a protein preparation of apathogenic bacteria and particularly by penicillin proved ineffective When further sputum studies suggested the presence of molds and yeasts, treatment with neoarsphenamine was instituted and proved effective The author gives a detailed description of a second case in which bronchomycosis was associated with cavitation and mentions three other cases of pulmonary lesions caused by molds observed within a short period at an Amsterdam clinic Potassium iodide, creosote, and especially neoarsphenamine give good results in cases of this type The clinical picture of diseases generally referred to in the literature as bronchomycosis are in reality pneumonomycoses The condition may take the form of bronchitis, acute bronchopneumonia, or indurating pneumonia, but, as a rule, it greatly resembles tuberculosis In cases in which examination of the sputum for bacteria fails to clarify the etiology, molds and yeasts should be searched for The author comments on the culture and differentiation of fungi

Antihistamine Preparation in Symptomatic Psychosis.—Assuming that a symptomatic psychosis might be the result of an allergic encephalopathy, Tolsma used the synthetic antihistamine product antallergan" (N-dimethylaminoethyl N benzylaniline hydrochloride) in the treatment of three cases The usual dose was 80 mg three times daily Results were favorable In the three reported cases the symptomatic psychosis was preceded by influenza, pregnancy, and rheumatic polyarthritis, respectively One case is discussed to illustrate that symptomatic psychosis may be irreversible

*Appearance of Pulp of Toes in Patients with Arterial Obliteration Its Prognostic Value R Leriche —p 909
Therapeutic Utilization of a Sulfonamide Compound with Enhanced Solubility A Ravina and H Chimènes —p 909

Appearance of Pulp of Toes in Arterial Obliteration —It is often difficult to determine whether a patient with arterial obliteration may be benefited by *arteriectomy* or ganglіectomy The appearance of the pulp of the toes of the patient is of value in establishing a correct prognosis Arteriography, performed on patients in whom the pulps of the toes were uniformly rose-colored, showed that there was reutilization of the main blood vessels below the thrombosed zone This reutilization is the essential prerequisite for the nutrition of the tissues Only the main blood vessels are capable of distributing the blood to all the tissues On the contrary, ivory white or purple appearance of the pulps of the toes is an unfavorable sign Although the pulps may occasionally regain their normal appearance after arteriectomy or gangliectomy, there is no certainty that the patient will be benefited by the intervention Comparative examination of the soles of both feet of the patient may also furnish valuable indications One completely ivory white sole and one normal sole may suggest an iliac obliteration If both soles are ivory-white, obliteration of the aorta or of both iliac arteries should be considered

*Pneumatosis Cystoides Intestinalis Clinical Study E Capovilla —p 7
Coagulants and Anticoagulants. R Camba —p 23

Pneumatosis Cystoides Intestinalis.—The occurrence of pneumatosis cystoides intestinalis is reported in two patients, a woman 25 and a man 28 who were admitted to the hospital with pain in the right side of the lower abdomen Diagnosis of chronic appendicitis was made When laparotomy was performed, gas filled cysts were observed in the ileocecal junction and in the ascending colon of the woman and in the omentum and the visceral peritoneum of the other patient Microscopic examination of the removed appendix of both patients revealed infiltration with neutrophil and eosinophil leukocytes in the parietal layers Microscopic examination of the removed fragments of the peritoneal serous membrane, in which gas-containing cysts were observed, showed that the cysts had a lining of endothelial tissue and an outer wall of connective tissue, with a few smooth muscle and elastic fibers Giant cells were not observed Roentgenologic examination without contrast medium was performed 24 hours after the operation and was negative in both patients The postoperative course was uneventful Both patients were in good health two years after the operation The exact etiology of pneumatosis cystoides intestinalis has not been established Various theories have been advanced It is believed that because of atrophy of the intestinal mucosa or a disturbance in its function of absorption an accumulation of gas producing substances may occur in the lymph vessels of the intestinal wall Pneumocysts then arise, and, by a process of osmotic equilibrium with the fluids of the organism, the gas comes to resemble air in composition Diagnosis of the disease is difficult, most of the 200 cases reported in the literature were discovered accidentally in the course of necropsy or, as in the author's cases, during exploration of the abdomen for other disturbances Pneumatosis cystoides intestinalis is generally associated with other intestinal diseases and does not require specific treatment Surgical or medical treatment of the associated disorder may simultaneously cause disappearance of symptoms of pneumatosis cystoides intestinalis Partial removal of the cystic wall is advisable when large subserous gas-containing cysts cause intestinal occlusion Intestinal resection should be performed only in cases in which occlusion is total and permanent This may occur especially in cases of submucosal pneumatosis

*Paraaminosalicylic Acid in Treatment of Nonmiliary Pulmonary Tuberculosis Roentgenoclinical Study P Véran and U Guinot —p 1813
Two Sulfone Compounds Associated with Paraaminosalicylic Acid in Treatment of Pulmonary Tuberculosis (Roentgenoclinical Study) P Véran N Rist J Cottet and U Guinot —p 1820
*Resistance of Mycobacterium Tuberculosis to Paraaminosalicylic Acid N Rist, P Véran B Ballet and others —p 1823

Paraaminosalicylic Acid Therapy in Pulmonary Tuberculosis.—Paraaminosalicylic acid was given to 233 patients with pulmonary tuberculosis for periods varying from 50 days to eight months, with a follow up period of three to six months All the patients had a complete rest for several weeks before institution of treatment Twenty to 25 gm of the drug (30 gm for patients with body weight over 70 kg) was given in eight divided doses in 24 hours, five days a week for six weeks Treatment was continued for two to eight months with eight-day interruptions every six weeks for repeated laboratory tests Treatment was terminated because of intolerance, therapeutic failure, lack of improvement for four to eight weeks, or institution of collapse therapy In patients in whom the drug is effective, the symptoms subside rapidly within several weeks, if response is slower, continuation of the treatment for two or three months more is not only useless but harmful, since it usually causes clinical and bacteriologic resistance to the drug The antipyretic effect of the drug and the reduction and clearing of the sputum induced by the drug were pronounced, resulting in functional improvement, which, although only temporary, may be of great importance in certain patients The authors do not share the opinion of others that patients treated with paraaminosalicylic acid may no longer be considered as bacteriologic carriers Patients with recent nodular lesions responded best to the drug, while those with cavitary lesions were therapeutic failures Clear or suppurative effusions associated with intrapleural or extrapleural pneumothorax were not benefited A favorable effect of the drug was observed in patients with acute serofibrinous pleurisy, particularly with intravenous administration The drug was best tolerated when administered by intermittent intravenous drip, but roentgenologic improvement was not increased by this route of administration Although less effective than streptomycin, paraaminosalicylic acid has a definite place in the treatment of pulmonary tuberculosis, because of the bacteriologically satisfactory results from combined treatment with streptomycin or sulfones and because of its favorable effect on fever and sputum

Resistance of Bacillus Tuberculosis to Paraaminosalicylic Acid—Forty three patients with cavitary pulmonary tuberculosis were treated with paraaminosalicylic acid (20 25 gm daily by mouth) for eight to 36 weeks The sensitivity of Koch's bacillus to the drug was determined in vitro Strains to be considered resistant are those yielding visible growth in culture in Dubos medium containing 2 5 γ of paraaminosalicylic acid per cubic centimeter three weeks after the inoculation of 0 01 mg of bacilli (moist weight) into 5 cc of medium Before treatment, 11% of the strains were resistant, after 70 days of treatment 61% were resistant, after 126 days 88%, and after 182 days 100% Comparison of the curves of resistance of Koch s bacillus to paraaminosalicylic acid in the course of treatment to those of streptomycin resistance in the course of streptomycin therapy showed that the incidence of resistance to paraaminosalicylic acid equaled that to streptomycin This resistance is responsible for the inefficacy of the treatment Resistance should be prevented by limiting the duration of treatment with paraaminosalicylic acid alone to four to six weeks and by limiting the indications to noncavitary forms of tuberculosis and to using the drug occasionally for preparatory treatment preceding surgical collapse therapy for cavitary tuberculosis In those cases in which prolonged streptomycin therapy may be anticipated it should be combined with paraaminosalicylic acid treatment starting the fifth week at the latest In those cases in which streptomycin is contraindicated, combined treatment with sulfone compounds and paraaminosalicylic acid should be practiced

27 2109 2168 (July 2) 1951

*Direct Epicardial Electrocardiograms (Electrograms) Obtained in Course of Five Surgical Interventions on Human Heart G Carouso H Chevalier B I L[illegible]tscha and J Lenègre —p 2109

Angina Pectoris and Calcific Aortic Stenosis Twenty Anatomicoclinical Observations A Mathivat, D Lembessis and R Paulon —p 2119

Coagulability of Blood in Cardiac Decompensation Before and After Treatment J L. Beaumont and J Lenègre —p 2128

Epicardial Electrocardiograms from Human Heart.—In the course of surgical interventions 27 epicardial electrocardiographic tracings were taken directly from the hearts of five patients Of these, three with right ventricular hypertrophy were subjected to subclavicular pulmonary anastomosis for tetralogy of Fallot, one with left ventricular hypertrophy was subjected to resection for coarctation of the aortic isthmus and one with an almost normal heart to ligation of patent ductus arteriosus The exploring electrode was connected with the wire of the unipolar precordial leads, and the indifferent electrode was connected with the central terminal of Wilson as for unipolar precordial recordings The sterilized exploring electrode was inserted through a buttonhole incision of the pericardium, 3 to 5 cm in length and was brought into immediate contact with various areas of the epicardial surface, without interposition of cotton This was done without causing any immediate or late untoward reactions The conclusions drawn from the direct tracings were as follows 1 In patients with right ventricular hypertrophy, various types of R, RS, Rs and rS were observed, according to the explored areas of the right ventricle, and types of qRS and QRS complex were obtained with the electrode exploring the left ventricular epicardium When the electrode is placed on the right ventricle, the major deflections of the R wave express well the variations of the potential of the right ventricular epicardial surface, particularly in the dense area of the right border and of the supraventricular ridge When the electrode is placed on the left ventricle, the major deflections of the S wave accurately show the variations of the potential of the hypertrophied right ventricle The types rS or RS of the hypertrophied right ventricles manifest variations of the potential of certain zones of the epicardial surface of the right ventricle, such as the trabecular zone and the anterior surface between the trabecular zone and the infundibulum pulmonis 2 In the patient with left ventricular hypertrophy the direct leads revealed tracings of rS and RS types at all the areas of the right ventricular epicardium and of qR type at the left ventricular epicardium 3 The direct electrocardiographic tracings obtained from patients with right or with left ventricular hypertrophy resembled closely the tracings obtained by the unipolar precordial method, this shows the high diagnostic value of Wilson and co workers' unipolar precordial recordings 4 The tracings obtained with direct epicardial leads revealed that even in true right ventricular hypertrophy the left epicardial surface (left border and posterior aspect of the left ventricle) shows an initial electronegativity This observation proves that the first cardiac vector moves from the left to the right, even in the presence of great changes in the weight relationship between the two ventricular masses (right ventricular hypertrophy)

*Histological Type and Response to Irradiation in Carcinoma of Uterine Cervix E Schüller —p 321

Histological Type in Carcinoma of Uterine Cervix—Schuller analyzed the records of 1,160 women with carcinoma of the uterine cervix who had been treated by irradiation In only 733 was the histological material adequate for complete analysis For estimation of sensitivity to irradiation Pendl s histological classification of cervical carcinomas is superior to Glücksmann s, which leaves too much to subjective interpretation, giving too much attention to the gross pathologic aspects and not enough to the detailed histological structure Pendl s classification divides the tumors into various types that show a characteristic response to irradiation The cases reviewed here corroborated Pendl s claim that the predominance of spindle shaped cells in the mucosal type and the slightly differentiated carcinomas of the parvicellular and macrocellular intermediary type were the ones that responded best to irradiation The incidence of the different histological types in the cases reviewed here corresponded largely with figures given by Pendl The histological type of a cancer of the uterine cervix not only permits an estimate of its responsiveness to irradiation but can also aid in the decision as to whether surgical treatment is advisable Cylindrical cell cancers and certain mucosal types of cancers are not responsive to irradiation and radical surgical treatment is therefore advisable in these types Carcinomas surrounded by eosinophilic infiltrations seem to have a good prognosis as regards response to irradiation

BOOK REVIEWS

The Neuroses: Diagnosis and Management of Functional Disorders and Minor Psychoses By Walter C. Alvarez, M D Cloth. $10 Pp 667 W B Saunders Company 218 W Washington Sq Philadelphia 5 7 Grape St. Shaftesbury Ave, London W C.2 1951

Dr Alvarez has attempted to bring before the medical profession 45 years of experiences in treatment of disturbed patients Some of the problems could be understood by a study of the disease, but many of them could be understood only by the study of the persons who had them In an era when persons are conscious of disease, Dr Alvarez has attempted to improve the physician's approach to the person who has become the patient

His approach, as synthesized in 600 pages gleaned from a vast and varied experience in internal medicine, is fundamentally intuitive and empiric It is based on a common sense evaluation by a sympathetic physician-counsellor who is cognizant of his patient's hopes and aspirations, fears frustrations, and obligations, as well as his physical make up and his hereditary endowments

Dr Alvarez tends to place much more emphasis on heredity than on environment The role of each factor is open to a great deal of debate at the present time His approach is based on experience with a given problem in a given patient rather than on a dynamic psychiatric evaluation of the individual case, as one would be led to believe by the title of the book Even though Dr Alvarez attempts to describe and catalogue certain criteria in the neuroses and psychoses, he succeeds more in documenting his personal experience in a vast number of instances, in which he reasons from a particular case to the general principle in drawing his conclusions While this experience makes interesting reading and may be helpful in a general way to both practitioner and internist, it may be difficult to convey effectively to the reader an approach that is so intuitive No well-defined concept of the neuroses is presented from either an etiological or a diagnostic point of view

However, Dr Alvarez does succeed in offering something of the essence of the manner in which an astute practical, and sympathetic clinical mind is able to handle the neurotic disturbed patient at the level of the nonpsychiatrist

Chronic Ulcerative Colitis (Thrombo-Ulcerative Colitis) By J Arnold Bargen M D Publication number 101 American Lecture Series monograph in American Lectures on Abdominal Viscera edited by Lester R. Dragstedt M D Chairman Department of Surgery University of Chicago School of Medicine Chicago Cloth $2 Pp 62 with 3 illustrations. Charles C Thomas, Publisher 301 327 E Lawrence Ave Springfield Ill Blackwell Scientific Publications Ltd 49 Broad St. Oxford England Ryerson Press 299 Queen St W Toronto TB 1951

Probably no other living physician—or even any physician in the future—can have the experience that Dr Bargen has had with ulcerative colitis This short monograph gives a critical review of his clinical experience He has discussed adequately the diagnosis, with all its ramifications, and the complications that might ensue The treatment has the usual method outlined for any abdominal disease that is as disabling as ulcerative colitis Diet is an important factor Curiously enough, however, Dr Bargen does not rely so much on vaccine therapy now as he did in the past, and he puts special emphasis on the use of sulfonamides His experience with antibiotics is comparable to that of others with fewer patients, but he has come to the same general conclusion as to their therapeutic value The author recognizes that there is some value in parasympatholytic drugs and also in barbiturates

From a surgical point of view he recommends that ileostomy precede a colectomy Certainly no one can disagree that in a patient with a long standing chronic, irreversible disease, ileostomy should precede colectomy and that colectomy should be the operation of choice, as he suggests Finally, in discussing treatment, Dr Bargen does give some lip service to the psychosomatic relationships and discusses the time honored approach of the average physician to psychosomatic aspects of this disease

At the outset, on page 5 of the introduction, he says, "Anxiety and emotional upsets do not cause ulcerative colitis, but its progression and failure to respond to treatment may well be aided and abetted by an unhappy frame of mind The mental state of the patient should be observed and psychosomatic relationship to the disease should be discussed in a guarded manner" This use of the words "in a guarded manner" is questionable. Should not the patient become acquainted with the fact that *there might be psychological* reasons and emotional factors that might be intimately connected with his disease? Should not a patient be taken into a physician's confidence and be told of the etiological and life situations that might interfere with the normal progress and healing in any disease?

Despite these controversial points of view, this monograph will serve excellently for the clinicopathological diagnostic approach *to what Dr Bargen calls "thrombo ulcerative colitis"* He outlines the more or less standard medical management, even including the rather temporary results with corticotropin (ACTH) To those unacquainted with the clinical picture of this disease, organic information elicited should prove of distinct help and edification

Introduction to a Psychoanalytic Psychiatry By Paul Schilder M.D Ph D Authorized translation by Bernard Glueck M D Cloth $3.25 Pp 178 International Universities Press Inc 227 W 13th St New York 11 1951

This book is a translation from the original in German, stimulated by the translator s belief that the book represents the first attempt at a systematic presentation of clinical psychiatry on a psychoanalytic basis Schilder s agreement with Freudian opinion on the clinical symptom-complexes of psychiatry is illustrated in the contention that symptom-complexes ordinarily embrace three types of phenomenon those representing remains of a normal state or of neurosis, phenomena of a residual nature, those representing the detachment of the libido from its object, phenomena of regression, and those representing attempts at recovery

The opinion is expressed that psychoanalytic psychology has furnished psychiatry with the possibility of eliminating artificial lines between neuroses and psychoses and between neuroses and so-called normal psychological manifestations It thereby makes possible the extension of the understanding of psychoanalytic psychiatry to general problems of human conduct that lie outside the strict field of clinical psychiatry

The book describes in detail the concepts of ego ideal, ego instincts, and phenomena of hypochondriasis, depersonalization, repression, and narcissism Other chapters consider the basic factors underlying the major psychoses

Modern Trends in Paediatrics Edited by Sir Leonard Parsons, M.D F R.S F R.C P Cloth $12 Pp 601 with 110 illustrations. Paul B Hoeber Inc. (*Medical book department of Harper & Brothers*) 49 E 33rd St. New York 16 1951

This is a collection of articles written by contributors who are known for their excellence in the fields they discuss. In no sense has the editor attempted to survey the entire subject of pediatrics He has selected topics on the basis of recent advances or of present interest in the field The chapter topics vary from a discussion of preventive pediatric services recent trends in the United Kingdom, to hemolytic disease of the newborn Some of the chapters present new information, and some contain better known information in a well-organized manner Owing to the necessary brevity of the articles, several contributors discuss in chronological fashion the findings and publications that have marked progress The bibliographies accompanying these chapters are excellent

Because of the composition of the book and the limited number of subjects that are presented in detail, it is not a general reference or textbook It would be of greatest interest to the persons with pediatric training who might wish to read articles that concisely summarize the available information on various trends in pediatrics

Spezielle Pathologie der Krankheiten des zentralen und peripheren Nervensystems Von Dr Gerd Peters Professor der Neurologie und Psychiatrie an der Universität Bonn Cloth 56 marks. Pp 437 with 214 illustrations Georg Thieme Diemershaldenstrasse 47 (14a) Stuttgart O agents for U S A Grune & Stratton Inc 381 Fourth Ave New York 16, 1951

In this book, dedicated to Spielmeyer, the specific pathology of the diseases of the central and peripheral nervous systems is discussed in a well-organized fashion and documented by well-chosen and well reproduced illustrations, most of them photomicrographs An attempt is made to correlate anatomic with functional alterations and, not very extensively with the clinical picture In addition to inflammatory circulatory, degenerative, traumatic, and tumorous lesions and malformations, the effects of chemical and physical agents are extensively discussed This is followed by an unusually useful compilation of the anatomic alterations of the nervous system in the various internal medical diseases, and finally by a discussion of the hypothalamic pituitary syndrome A large amount of information is compressed into a relatively limited space and the style is clear A small number of references are given as footnotes Almost all the information given can be found in comparable books in English, nevertheless the unusual completeness of some of the chapters may make the study of this book valuable to the American internist, pediatrician and pathologist looking for information in neuropathology

Tuberculosis in the Aged. By Erik Tengve Med. Lic. Sthlm [Thesis M D Uppsala University] Translated by Klas Magnus Lindskog Paper Pp 114 with 3 illustrations Orlel Blombergs Nya Aktiebolag Lindesberg 1951

In this monograph Tengve reviews the literature on tuberculosis in the aged He discusses symptomatology and classification of types and the incidence of tuberculosis in Sweden in several age groups including that of the aged The drop in the tuberculosis mortality rate in Sweden, chiefly in the age group 20 to 30 accentuates the mortality rate in the age group over 60 Tuberculosis in old persons has thus acquired a mounting importance The author suggests also that the relatively high incidence in the aged may be a relic from the times when the tuberculosis mortality rate in Sweden was much higher than it is now and that these facts might justify the assertion that in 10 or 20 years time we will witness a significant diminution of the general death rate in tuberculosis

Analysis of cases shows that the percentage of open cases is much higher in old persons with tuberculosis than in other tuberculous persons It was found however, that most of the older patients with tuberculosis had had the disease more than a year before thev were admitted to the hospital These persons who in most cases had chronic and open tuberculosis, must have const ed a source of infection especially for their families It was demonstrated that about one third of all the children and grandchildren in the families of affected persons as a rule had or had had manifest tuberculosis of the lungs It was also shown that about one fourth of all the cases were known to the dispensaries before the patient s admission to the hospital This extremely careful and well reasoned summary has a significant application to the problem of control of tuberculosis this country

Das Elektrokardiogramm: Theorie und Klinik Von Dr med Hans Schaefer o Professor und Direktor des physiologischen Instituts der Universität Heidelberg Cloth 55 marks Pp 556 with 349 illustrations. Springer Verlag k Reichpietschufer 20 Berlin W 35 (West Berlin) Neuenheimer Landstrasse 24 Heidelberg Göttingen 1951

This extensive monograph on the electrocardiogram represents a significant contribution to the subject The monograph s strength lies in its handling of theory The clinical aspects are less satisfactory and the section on arrhythmias is not so outstanding The author has taken the opportunity in this monograph to expand the important contributions made by himself and his co-workers to the theory of electrocardiography

The first section deals with the theory of action potentials the second, with its application to the actual recording of cardiac events Use is made of the monophasic curve, of current flow inside and outside the muscle cell, of the depolarization and repolarization processes, and of vector analysis Also considered is the concept of solid conductors The remaining sections deal in turn with the QRS complex the S T and T complexes, and the arrhythmias The monograph closes with a consideration of chest leads

A mass of data are presented in this tome It is lengthy and repetitious at times, as would be expected from the traditional German style of presentation It embodies some extremely stimulating ideas, which do not always parallel teachings current in this country For example the concept recently advocated by Robb, that the conduction system stimulates the heart muscle segmentally, making it, as it were, a series of islands innervated ' by the conduction system, carries with it a great many possibilities In considering the T wave, the author points out that in addition to the contour determined by the ventricular gradient, which has a vector opposite in direction to that of QRS, T contour is influenced by another vector directed from base to apex, determined by a metabolic gradient , and in the case of injury by a third vector oriented in a direction opposite to the vector depicting the injury S-T deviation

The author makes use of vector analysis in the frontal plane based on the Einthoven triangle concept As a matter of fact except for the more or less isolated sections at the end dealing with precordial leads the discussion is concerned primarily with the frontal plane The author points out that the unipolar lead connection, even when the electrode is on the heart itself, has so much extrinsic distortion in it that the use of the R wave peak in such leads to determine the onset of the intrinsic deflection is fraught with error He favors, generally the dipole field theory, in which all regions of the heart have somewhat equal influence on the electrocardiogram Actually, each region has an influence varying with the square of the distance from the electrode and directly with its thickness and area There are some elaborate mathematical developments, particularly in regard to precordial leads In employing mathematical formulation and vectors, the author points out that they are only approximations of the actualities, owing among other things to the fact that the field surrounding the heart is not homogeneous

This monograph is highly recommended to the serious student of electrocardiography It is not suitable for the beginner or casual reader The stimulation, the new ideas, and the reorientation toward some of our traditional," though recently developed, views on electrocardiography will more than compensate anyone for the energy employed in unravelling the details Merely a study of the theoretical presentation by means of the diagrams will be extremely illuminating

DeLee's Obstetrics for Nurses By M Edward Davis M D Joseph Bolivar DeLee Professor of Obstetrics and Gynecology University of Chicago and Catherine E. Sheckler R.N M.A Assistant Professor of Nursing Education University of Chicago Chicago Fifteenth edition Cloth $4.50 Pp 673 with 387 illustrations W B Saunders Company 218 W Washington Sq Philadelphia 5 7 Grape St. Shaftesbury Ave London W C.2 1951

This is a well-organized, well integrated, and beautifully written textbook of obstetrics for nurses Eminent in their own fields, the authors have recognized essential facts and procedures for nurses, presenting them in concise form with an added pleasant readableness Obstetrics and obstetric nursing is a vast field with ever-broadening horizons The quality of this book is greatly enhanced by the artful presentation of recent advances in the immediate and allied spheres by contributing authors proficient and practiced in their subjects

Particularly gratifying are the chapters on community aspects of maternal and infant care, home nursing, and the emotional aspects of pregnancy The nurse s role is a signal one in the area of prenatal care, the greatest contributing factor in the reduction of maternal and infant morbidity and mortality rates The marked advances in these phases engender interest and competence in the nurse and therefore, serenity and confidence in the patient and her family

Figures and statistics are accurate and compare with those cited from other large surveys in recent literature Illustrations are excellent and completely up to-date, many being photographs taken in the authors clinical field The authors have retained the unit format of previous editions and have succeeded in adequate revision plus recent bibliographies A fine sense of human devotion, a true philosophy of medicine pervades the book

The Collected Papers of Adolf Meyer General Editor Eunice E Winters. Volume I Neurology With Introduction by Louis Hausman M D Professor of Clinical Medicine (Neurology) Cornell University Medical College New York Volume II Psychiatry With Introduction by Sir David K Henderson M D F R.C P Professor of Psychiatry University of Edinburgh Edinburgh Cloth. $30 per set of 4 volumes Pp 693 with illustrations 674 with portrait Johns Hopkins Press Homewood Baltimore 18 1950 1951

Adolf Meyer was the proponent of important psychiatric theories and a physician of diverse interests, among which can be listed medical education It is extremely unusual that a man of these qualifications should not have written a book Instead of this, Dr Meyer during his lifetime had the occasion to publish more than 250 papers in many European and American journals The books he did not publish have been published for him in the form of his collected papers This set will comprise four volumes Volume 1 is devoted to Meyer s neuroanatomic, neurological, and neuropathological papers Review of these papers makes abundantly clear his wide range of interests and his keen perception of basic principles His work on the optic radiation, a portion of which bears his name (Meyer's loop) is a model of correlation of evidence from several disciplines The neuroanatomy of the optic radiation was worked out with great care The evidence from pathological lesions was brought to bear on the anatomic principles, and then both the anatomy and pathology were given clinical application Though some of the theories that Dr Meyer propounded on the functioning of the nervous system are probably outdated, his observations are always worth reading and at times are a model of description

It is fitting that the volume on psychiatry (Volume 2) should follow the one on neurology This is both chronologically and developmentally correct in the reconstruction of Dr Meyer's interest in medicine He made no great secret of the fact that his psychiatric concepts had proceeded from his interests in the basic neurological sciences, and expressed this in calling his approach psychobiological In view of the recent emphasis of psychoanalytical principles in psychiatry it may seem almost archaic to contemplate some of the Meyerian theories However, a review of his papers in psychiatry is provocative on many points, two of which may be mentioned First, it is amazing how many of Dr Meyer s concepts now seem commonplace This, however, is only because they are taken for granted, and their universal applicability only adds to Dr Meyer s fame in originally propounding them Secondly, it is refreshing to read some of his appraisals of psychoanalytical theories It seemed a characteristic facet of his greatness to be able to give just due to men and to theories that might be considered opposed to his In these days when discussion between various psychiatric schools brings more heat than light Meyer s inherent fairness seems like a world apart

The two volumes in many ways are complementary to each other The purpose of the editor was to present Meyer's views of psychiatry and neurology as he expressed them through his papers In some sections of the volumes one wishes that critical correlation and evaluation had been attempted This, however, was not the editor s purpose Her intentions were to let Adolf Meyer speak for himself This he does in a lucid and instructive manner

Problems of Consciousness Transactions of the First Conference, March 20 21 1950 New York, N Y Edited by Harold A Abramson M D Cloth $3 Pp 200 with 15 illustrations Josiah Macy Jr Foundation 565 Park Ave New York 21 1951

This is a verbatim report Participants in the conference were 18 outstanding scientists from the fields of psychology, psychiatry, physiology, biology, embryology, and zoology Discussion material is presented on an informal basis and centers around the problem of sleep wakefulness cycle, psychoanalytic concepts of sleep and dreams, perception of pain, phenomena of hypnosis and consciousness and the chemistry of time

The major purpose of the conference was to attempt to overcome the difficulties in communication both emotional and semantic between the many disciplines involved in the discussions and thus, through mutual understanding, to move toward a unification of interpretation in all fields of science, so that a science of man ' might be developed in which medicine is considered to play a central role

Surgical Pathology of the Mouth. By E Wilfred Fish C B E., M D Ch B Dental Surgeon St Mary s Hospital London Cloth. $10 Pp 463 with 236 illustrations J B Lippincott Company 227 231 S 6th St., Philadelphia 5, Aldine House 10-13 Bedford St London W C.2 2083 Guy St., Montreal 1951

The author has written this textbook for the dental student or the practitioner as representing the irreducible minimum of pathology necessary for an understanding of daily practice and for prediction of results The book is not intended to replace or even approach the content of a textbook on general pathology Each chapter closes with a summary that is largely a restatement of the material content rather than an epitome of prevailing opinion Some of the subjects treated are as follows cell growth and degeneration, repair of the calcified matrix, circulatory disturbances, inflammation, chemotherapy and bacterial defence, surgical pathology of bone, pathology of dentine and dental pulp, of the cementum, of the pulpless tooth, of the mucosa, of the parodontal tissues, and of the enamel, foci of infection, neoplasia, mesenchyme tissue tumors epithelial tumors and tumors arising from specialized tissue, and tumors of developmental origin

The author presents his material in a lucid style The format and type are good, as are the photomicrographs and other illustrations The author writes on the basis of a broad experience in dental practice and general information There is little bibliography It is difficult to determine the position of this textbook among others in medical sciences, because the title could imply a specialized treatment of the diseases of the mouth region when actually the author states that the purpose of his book is to give the student and practitioner the minimum pathology essential to intelligent practice The title accordingly can be disadvantageous, because students and practitioners of dentistry will not realize that the book has much valuable information for them and surgical pathologists will be disappointed in finding that this is not a book on special pathology of the mouth

Good Health for You and Your Family E. Patricia Hagman Ed D., Editor Associate Professor of Health and Physical Education, Teachers College Columbia University New York Prepared from publications of Health and Welfare Division Metropolitan Life Insurance Company Cloth $3 75 Pp 305 with illustrations A S Barnes & Company 101 5th Ave New York 3 1951

As would be expected, because this volume presents material assembled from health and welfare publications of the Metropolitan Life Insurance Co , sensible recommendations and reliable information are provided The editor has set up the data in four sections, with some slight overlapping The first section contains hints for good health, with chief emphasis upon food and nutrition, and has numerous helpful charts and other illustrations on this subject

In the second section, dealing with common diseases and disorders, 32 conditions are given detailed attention ranging from appendicitis to whooping cough Discussions of many of these were prepared with the assistance of interested national voluntary or governmental agencies The third section, on child care, includes information for expectant mothers, tabulations on common childhood diseases, an immunization timetable, measurement of physical growth, consideration of behavior problems and discussion of child safety The final section, on safety and first aid, is especially well done and complete There are detailed recommendations regarding accident prevention both in the home and elsewhere, and well illustrated directions regarding first aid procedures Physicians can recommend this book to their patients without reservation

Handbook of Psychology By John H Ewen F R.C.P E , D P M Cloth. 25s Pp 215 Sylviro Publications Ltd 19 Welbeck St London W 1 1950

This handbook is intended for students who are taking up the study of psychology for the first time The author has attempted to describe the essential principles involved in psychology and the practical implications of these principles in practice The relationships of so-called normal psychology to psychologic medicine are described Short chapters on methods of treatment in psychoanalysis and other psychiatric and physical treatments of mental disorder are included

Emotional Factors in Cardiovascular Disease By Edward Weiss M D Professor of Clinical Medicine Temple University School of Medicine Philadelphia Penn Publication number 97 American Lecture Series monograph in American Lectures in Circulation edited by Irvine H Page M.D and A. C Corcoran M D Cloth $2 25 Pp 84 Charles C Thomas Publisher 301 327 E Lawrence Ave Springfield Ill Blackwell Scientific Publications Ltd 49 Broad St. Oxford England Ryerson Press 299 Queen St W Toronto 2B 1951

This is a well written book in nontechnical, popular style No phase of the subject is gone into deeply, because this book is written for the practicing physician and not for the psychiatrist A few sentences in the introduction are worth quoting The traditional old family doctor very often was an excellent psychosomatic physician, although he never thought of himself as such His patients usually were intimate friends, and he was as familiar with their emotional life as with their physical peculiarities He was well aware that the two frequently were closely related The present-day complexities of medical practice have taken the physician away from this intimate contact with his patient However, the emotional factors are still present and need evaluation in respect to diagnosis and treatment That is precisely what the author has done in this book

The problems of cardiac neurosis functional heart disease, neurocirculatory asthenia, hypertension, the cardiac with superimposed anxiety, and psychosis in cardiac disease are discussed clearly and concisely and are illustrated by well-chosen case reports This book is an excellent companion volume for the others that have appeared in the series of American Lectures in Circulation

Micro-Analysis in Medical Biochemistry By E J King M A Ph D D Sc Professor of Chemical Pathology in University of London (Post graduate Medical School) London Second edition Cloth $3 50 Pp 222 with 22 illustrations Grune & Stratton Inc. 381 Fourth Ave New York 16 1951

This textbook of clinical chemistry contains clear concise directions for determining the functioning of various organs and for analyzing small amounts of body fluids, feces and urine calculi, and gastric and duodenal contents Besides giving instructions for specific tests, the author discusses normal values for the methods included in the text, spectroscopic procedures hydrogen ion concentration, preparation of volumetric solutions, and the use of colorimetric and photometric instruments Only brief statements are made on the significance of the tests The organization of the material, the index, and the make up are good, but it is a little surprising to find directions for determining pH only by means of indicators

Evolution Emerging: A Survey of Changing Patterns from Primeval Life to Man By William King Gregory Collaborative work of American Museum of Natural History and Columbia University Volume I Text. Volume II Illustrations Cloth $20 per set Pp 736 1013 The Macmillan Company 60 Fifth Ave New York 11 1951

This encyclopedic work presents a broad survey of the animal kingdom, with emphasis on the extensive series of evolutionary transformations that have led from ameba to man The first volume contains 559 two-column pages of text and 144 pages of bibliography The second volume contains 1,013 pages of illustrations, most of which are clearly labeled line cuts In many instances the drawings represent series of animals or of structures arranged along comparative systematic lines to indicate the range and evolution of form in a given group The book presents a stimulating review of the evolutionary concept in an easy informal style

The Chemistry and Technology of Food and Food Products. Prepared by group of specialists under editorship of Morris B Jacobs Ph.D Adjunct Professor of Chemical Engineering Polytechnic Institute of Brooklyn Brooklyn In 3 volumes. Volume I Second edition Cloth $12 Pp 832 with illustrations Interscience Publishers Inc. 250 Fifth Ave New York 1 Interscience Publishers Ltd 2a Southampton Row London W C 1 1951

The first edition of this comprehensive work consisted of two volumes, but, because of the great progress made in food technology and chemistry since its appearance in 1944, the current edition has had to be expanded to three volumes These present a complete description of the technical aspects of foods, their sources, composition processing and the related body physiology Because of the great difficulty any one person would have in surveying adequately the entire field of food chemistry and food technology, 39 authors, each a specialist in his field have contributed to this authoritative work Among them are food technologists, chemists chemical engineers, biochemists, bacteriologists, sanitary engineers, public health officers, food inspectors, and entomologists Several contributors to the first edition were not able to revise their chapters on time and the editor, who is well versed in the broad subject of food control has done an excellent job of revising the chapters concerned

The first part of Volume 1 deals with fundamental food chemistry and contains an extensive discussion of the known nutrients and their chemistry and function in the body It is noted that no mention is made of the use of iodized salt as a dietary source of iodine *Also the statement is made that vitamin D_3 is about 1 5 times more efficient in man than vitamin D_2* The Council on Foods and Nutrition of the American Medical Association does not recognize any difference between vitamins D_2 and D_3 *in man The use of the term "vitagens ' referring to a group of* so-called essential food fractions is not in general usage and may be new to many readers

Part 2 discusses unit operations and processes that apply to most foods, such as evaporation extraction, mixing, and dehydration Part 3 is concerned with the maintenance of sanitary and quality control Stress is given to the proper use of pesticides in preventing contamination of foods In spite of the fact that this edition is advertised as completely revised the Council on Foods and Nutrition is still incorrectly referred to on page 612 as the Committee on Foods, a name that went out of use in 1936

Throughout the entire volume there are frequent references to the literature, and a bibliography is included at the end of each chapter This volume is a combination textbook on food chemistry and source of general information on food processing It is aimed at the food technologist, but the physician and graduate student interested in foods will find it a profitable addition to his reference library

Hospital Staff and Office Manual By T M Larkowski M D F A.C S Professor of Clinical Surgery Stritch School of Medicine Loyola University Chicago and A R. Rosanova R.Ph. M D Clinical Instructor University of Illinois Medical School Chicago Cloth Pp 428 with illustrations Romaine Pierson Publishers Inc 676 Northern Blvd Great Neck New York 1951

If one has ever had the experience of being a naive substitute intern tossed into the maw of a busy medical ward and confronted with terrifying orders to perform hypodermoclyses, spinal taps and bewildering laboratory procedures, he will regret that this valuable little manual was previously unavailable

Tersely restricted to essentials and amply illustrated, it scans routine hospital techniques, laboratory procedures, electrocardiography, and radiography It also outlines the specialized examination of the various anatomic systems It can be recommended as an excellent handbook for the senior medical student, intern, and practitioner as a reminder of the essentials of medical practice

Primer on Alcoholism How People Drink How to Recognize Alcoholics and What to Do about Them By Marty Mann Cloth $2 Pp 216 Rinehart & Co Inc 232 Madison Ave New York 16 1950

The author executive director of the National Committee on Alcoholism, describes causes of alcoholism from a practical, experienced lay viewpoint He defines the alcoholic drinker as opposed to the social" or heavy drinker and discusses steps to be taken by the family and friends of the alcoholic in their attempts to bring him to effective treatment Comment is made on methods of treatment through psychiatry, various types of medication, aversion treatment and effectiveness of Alcoholics Anonymous

The book is for the laity and is stated to be primarily directed toward the estimated 20 million or more persons who may be in some way related to or involved with, an alcoholic. The stated object is to provide these persons with the up to-date basic knowledge and practical information that is available for the proper handling of this disease The material is well presented, and the chapters concerning psychiatric treatment and the methods of the Alcoholics Anonymous group are of value

QUERIES AND MINOR NOTES

ENTERITIS IN TOURISTS

To the Editor —*Many American tourists in Mexico have enteritis (usually mild) soon after arrival As a rule the general well-being and the appetite are not disturbed, however, some patients have a great number of stools without tenesmus daily What is the cause of this disease, and what is the best way of treating it?*

M D , Wisconsin

This inquiry was referred to two authorities, whose respective replies follow —Ed

Answer —Many factors may be involved in the enteritis occurring among tourists from the United States in Mexico Ordinarily the cause is associated with staphylococcic or streptococcic contamination of food, with resulting production of chemical toxins which are highly irritating to the the intestinal mucosa The extent of the reaction seems to depend on the physical condition of the person involved, being more serious in fatigued individuals If the diarrhea continues, bacillary infection or amebiasis may be suspected The diagnosis in these instances can be established only by repeated stool examination Salmonella infection may also occur

Symptomatic treatment with milk of bismuth and paregoric is usually satisfactory Tea should be drunk frequently during recovery in order to restore fluid loss and reduce local irritation If amebiasis occurs, specific therapy with carbarsone or iodochlorhydroxyquin is usually effective In bacillary involvement, an intestinal antiseptic such as phthalylsulfathiazole or neomycin is indicated

Enteritis may be avoided by restriction of fluids to bottled beverages and by avoidance of fresh vegetables or fruits Salad dressings, ice creams, pastries, and other foods that may be contaminated in handling should be avoided Except at first-class hotels, tourists would be wise to eat only freshly and well cooked foods

Answer —The condition described is extremely common, it is sometimes called "tourist s disease" or "Aztec disease " Actually there are probably several types of acute gastroenteritis that commonly afflict tourists and even natives in Mexico Some of them are almost undoubtedly due to Staphylococcus or Staphylococcus toxins, others are probably caused by Salmonella or other members of the paratyphoid group It is important that the mild and temporary gastroenteritis not be confused with more serious infections which are also common in Mexico Good results are often obtained with streptomycin (1 gm in 20 cc of salt solution, taken 10 or 15 drops at a time every hour) Sulfadiazine and either paregoric or some other opium derivative with bismuth have been found effective If the condition does not clear up in 48 hours with one of the appropriate treatments, it is wise to be examined for other conditions, particularly amebic dysentery or one of the paratyphoids Actually the severity of the gastroenteritis varies widely, presumably because of differences in the number of germs or amount of toxin ingested and, possibly, individual resistance

ALLERGIC BLOOD DONORS

To the Editor —*Should a person who is allergic donate blood for transfusion? Will the recipient become allergic?*

M D , New York

Answer —It is difficult to give a precise answer to this inquiry without more information on the nature of the allergy present Severe or active allergic manifestations should certainly disqualify a donor but apart from this a donor may be accepted The allergic reaction occurs in less than 1% of blood transfusion recipients and appears usually as transient, small urticarial lesions but occasionally as so-called giant edema and rarely as respiratory difficulty attributed to edema of the larynx or asthmatic reaction Injections of epinephrine usually afford prompt relief In most instances, questioning of both donor and recipient reveals no history of allergic episodes apart from the transient reaction itself Systematic efforts to exclude allergic donors have certainly not eliminated this type of reaction In a few scattered cases, correlation has been observed with specific sensitization of the donor and the recipient has appeared sensitized for up to three months, although it does not appear that such passive sensitization has been associated with any great harm to the recipient

CHRONIC LEG ULCER

To the Editor —*A man aged 62 has an ulcer 2½ in (6 cm) in diameter just above the external malleolus of the right leg He does not remember injuring the leg It began as a small ulcer and gradually increased in size He was treated with medicated (contura®) bandages for three months with little improvement His veins are not large and except for the area immediately surrounding the ulcer the skin is in good condition There is no discoloration or edema General physical examination discloses no abnormalities His blood pressure is normal the Kahn reaction of the blood is negative, and results of urinalysis were negative for albumin sugar casts pus and blood What treatment would you advise? Would ligation and injection of the saphenous vein help the ulcer on the lateral surface of the leg?*

M.D , West Virginia

Answer —Chronic leg ulcer above the lateral malleolus in a 62 year old man in the absence of visible or palpable varicosities or edema may be due to arterial or arteriolar sclerosis (even with a normal blood pressure) or to a broken down granuloma (syphilis, tuberculosis or other granulomatous infection) but most frequently to a low grade skin infection, initially neglected and not bandaged Complete bed rest in a hospital should be prescribed, with attempts to culture the organism If no specific cause can be found a wide excision of the ulcer, followed by a split thickness skin graft is in order, provided arterial circulation is satisfactory Division of the saphenous vein is not indicated unless valvular incompetence is demonstrated It would have to be the short saphenous vein, judging from the location of the ulcer

FIBROUS DYSPLASIA

To the Editor —*A boy 4½ years of age has polyostotic fibrous dysplasia The involvement is extensive with lesions present in the long bones of the upper extremity, pelvis, and lower extremity—all on the left side The case is further complicated by a pathological fracture through the neck of the left femur, which is healing under immobilization in plaster May I ask your opinion as to a therapeutic trial of either cortisone or ACTH? Has either of these been used in fibrous dysplasia?*

Richard J Rushmore, M D Florham Park, N J

Answer —The use of the cortisone or pituitary adrenocorticotropic hormone (ACTH) has not been tried in the treatment of fibrous dysplasia (polyostotic fibrous dysplasia) Since the disease is typically unilateral or confined to local areas, it seems that the developmental difficulty is a local disease or dysfunction rather than a hormonal one, as in osteitis fibrosa cystica (von Recklinghausen s disease) Therefore, from a theoretical view, there seems little to recommend the use of either cortisone or pituitary adrenocorticotropic hormone in the treatment of this condition As in this case, when fractures occur, the lesion usually heals In regions where a large amount of bone has been replaced by fibrous tissue, the fibrous tissue may need to be curretted out and chips of cancellous bone used to produce strong bone At present, other treatment has little to offer

---

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply Anonymous communications and queries on postal cards cannot be answered Every letter must contain the writer's name and address, but these will be omitted on request.

ACNE PRODUCED BY IODIDES

To the Editor —*A man suffering from bronchial asthma for five years has evening and night attacks every day The only medicine which helps is saturated solution of potassium iodide However, after three days of this treatment, acne with boils develops on the face The use of hydriodic acid has the same complication Can anything be done to prevent acne? Would it be worth while to try thyroid extract or a drug to suppress thyroid like thiouracil? Is banthine® helpful in asthma? Is there any relation between serum cholinesterase and asthma?*

E E Sheldon, M D New York

Answer —There is no certain method of preventing the acne produced by iodides The eruption will not be prevented by the use of enteric coating, organic iodine or any other method that will affect the absorption of the iodine radical In many cases, if the iodides are continued, the eruption ultimately disappears The addition of potassium arsenite (Fowler s) solution has been thought to modify this tendency The beneficial effect of iodine is due to its direct effect on the mucous glands of the bronchi It is obvious, therefore, that neither thyroid extract nor thiouracil would act in a similar manner Asthmatic patients who cannot tolerate iodides will frequently obtain benefit from expectorant doses of ipecac or ammonium chloride

Banthine® (beta-diethylaminoethyl xanthene 9-carboxylate-methabromide) has an action very much like atropine and is not likely to produce much benefit in asthma Cholinesterase serum levels have not been shown to be affected in asthma There is no certain method of increasing the cholinesterase blood level Epinephrine is, of course the most reliable sympathomimetic in asthma Methoxyphenamine (orthoxine®) hydrochloride is another drug that has been recently demonstrated to be useful in asthma

ASTHMA, THE SALIVARY GLANDS AND POTASSIUM IODIDE

To the Editor —*A patient with asthma has been getting fairly good relief with ephedrine On several occasions I have prescribed potassium iodide Each time after about 36 hours and only after a dosage of 0 3 cc three times a day had been reached his parotid and submaxillary glands would swell and become tender His appearance would be that of a person with mumps On withdrawal of the medication this swelling would recede Also on each occasion, his asthma which is of the chronic type would be benefited Could you enlighten me as to the reason for this peculiar reaction? M D Pennsylvania*

Answer —One of the normal actions of iodide is to stimulate mucus and serous glands It is due to this hypersecretion of a thin fluid by the mucus glands of the bronchi that benefit in asthma is obtained This same action results in overactivity of the salivary glands With excessive doses of iodides a large percentage of persons will experience many undesirable symptoms, including swelling of the salivary glands With the usual therapeutic doses employed in asthma, about 2 gm a day, about one in 50 will react with salivary gland swelling This is not in the nature of an allergic phenomenon but rather an exaggerated response of the normal physiological effect of the drug

THE WHIPPLE PRINCIPLE

To the Editor —*It is my understanding that the Whipple principle" is valuable in the treatment of secondary anemia Has it ever been utilized?*

Frank C Beall M D, Fort Worth Texas

Answer —Whipple and Walden (*Am J M Sc* 179 628 [May] 1930) described a liver fraction potent in anemia due to hemorrhage in dogs This extract, sometimes referred to as the "Whipple principle,' is the portion insoluble in 70% alcohol dried and designated the secondary anemia fraction Although the value of this fraction in secondary anemia of man has not been adequately demonstrated, it has been available commercially through Eli Lilly & Company and is probably the liver component of at least some of the liver and iron products now available

TOXIC GASES FROM GLASS MELTING

To the Editor —*In the process of glass melting one charge consists of cullet (broken glass) sodium carbonate sodium sulfate, manganese and calcium fluoride—this entire mixture coming in contact with the side wall material of silica Despite the ventilation system, gases are present in the surrounding area The men working near the glass melting process are, of late complaining of mild conjunctivitis lacrimation burning sensation of nasal mucous membrane cough, dermatitis and nausea It is thought that the combustion product silicon fluoride is the causative agent Is silicon fluoride the sole irritant? What concentration of silicon fluoride in the air would be needed to cause irritation? What other combustion products would be irritating? How serious or dangerous is silicon fluoride?* *Clarence T Risley, M D Conneaut, O*

Answer —This query implies but does not state that only one of several possible charges is associated with the disturbances described On that assumption the two likely variables are the manganese and the calcium fluoride However, the manipulation of any and all batches could be associated with irritants The gas fuel could lead to irritant sulfur compounds aldehydes and acrolein Both infrared and ultraviolet rays are emitted by the molten metal (glass) Prior to the molten state, dusts from the fines of the charge arising in the process of introduction into the pots provide irritants Sodium carbonate dust is a prospective offender The manganese dioxide will not produce the manifestations described but is occasionally the source of a severe central nervous system disease This is more likely to arise in the batch or mix house If the difficulty truly springs from the molten metal, the cause probably is sodium fluoride The calcium fluoride may be altered to the sodium salt, the sodium being furnished by the sodium carbonate This fluoride is more volatile than other common ones The action of this fluoride is likely to be limited to just the abnormalities mentioned In industry neither acute nor chronic systemic fluoride poisoning is frequent Surface irritation is frequent The maximum allowable concentration is 2 5 mg per cubic meter of air Obviously this is not a stringent standard allowance On an over-all appraisal it may be stated that no single precise substance is responsible and instead that multiple influences contribute, including rays gas combustion products heat, and dust

CASTS ON A LIMB

To the Editor —*What are the indications for the use of the Wilkie boot? Are casts ever kept on a limb too long? What are the indications for taking them off?*

M D, New York

Answer —The Wilkie boot has been largely given up in this country but is still useful in patients who are poor operative risks, especially with serious heart lesions

Absorption varies with the type of fracture or infection and whether an accurate apposition of the hip has been made

A cast can be kept on a limb too long, but indications for taking off a cast depend on the condition for which it is applied In rheumatoid arthritis, the cast must be removed every day for a period of time In fractures, it should be left on until the fracture is firm

YAWNING DURING SLEEP

To the Editor —*What is the significance of frequent yawning during deep sleep in a child of 7 who is normal in every way?*

R R Snook M D McLouth, Kan

Answer —Frequent yawning during sleep probably has no great significance It may indicate a mild sleep disturbance, causing lighter sleep than normal, which may be the result of too much excitement just before bedtime (as from watching television), an evening meal that was too heavy or some daytime behavior difficulties carried over into sleep In the absence of any other symptom or physical or emotion observations, it is impossible to know the cause It might be called a sleep tic various ones of which have been described

SERUM SICKNESS

To the Editor —*A man injured his finger and after a test for serum sensitivity received a prophylactic injection of tetanus antitoxin He had received an injection of tetanus antitoxin five years previously Two weeks after the injection generalized muscular and joint pain developed Two weeks later he was found to have acute nephritis He had 5% eosinophils, but no local or general skin manifestation His blood pressure was normal at that time The result of the heterophil antibody test was positive Five months later his blood pressure was 190/105 his heart was enlarged to the anterior axillary line, and he had pitting edema of the ankles Urinalysis revealed a specific gravity of 1 010, 2 + albumin, 4 to 6 white cells, innumerable red blood cells, and granular casts He had retinal hemorrhages Blood urea on two occasions was recorded as 46 and 32 mg per 100 cc Serum chlorides were 106 serum calcium was 4 8 and serum phosphorus 2 1 mg The serum albumin globulin ratio was 3 1 to 2 3 gm Phenolsulfonphthalein excretion was 27% in two hours A muscle biopsy was negative for changes indicative of periarteritis nodosa Are the above findings compatible with a diagnosis of (1) serum sickness with resulting periarteritis nodosa and nephritis or (2) acute inflammatory rheumatism with cardiovascular renal disease caused by antitoxin?* M D Virginia

Answer —The history of previous administration of tetanus antitoxin and the description of symptoms which followed by two weeks the injection of tetanus antitoxin after the finger injury strongly suggest serum sickness The fact that a muscle biopsy was negative does not exclude periarteritis nodosa The first diagnosis proposed seems to be the correct one

EFFECTS OF SMOKING

To the Editor —*Please tell me if any work has been done on the effect of smoking on (1) acidity of the stomach (2) basal metabolic rate and (3) sugar content of the blood*

H W Nottley, M D , White Plains, N Y

Answer —Gastric hyperacidity has been reported following smoking both as an effect of the nicotine on the nerve centers and as a local reaction to the irritating swallowed constituents of the smoke Basal metabolic rate changes resulting from smoking have not been described A rise in the blood sugar content of the blood following smoking has been repeatedly observed and has been ascribed to stimulation of epinephrine secretion by nicotine Conflicting results have been reported as a result of the use of insufficient dosage or controls Further information may be obtained in Schrumpf Pierron (Tobacco and Physical Efficiency Digest of Clinical Data, New York, Paul B Hoeber, 1927), Gray (Tobacco Smoking and Gastric Symptoms, *Ann Int Med* 3 267 [Sept] 1929), and Haggard and Greenberg (Effects of Cigaret Smoking upon Blood Sugar, *Science* 79 165 [Feb 16] 1934)

MENSTRUATION AT THE MENOPAUSAL AGE

To the Editor —*What is the proper management of a woman in the menopausal age who is essentially normal on physical examination but who complains of frequent or heavy menstrual periods?* M D California

Answer —Generally, surgical treatment is neither required nor satisfactory for frequent or heavy menstrual periods near the menopause In most women the bleeding ceases completely without the necessity for surgical therapy Of course, if there is any bleeding between the periods, cancer must be ruled out by curettage and cervical biopsy

If the menstrual periods are so profuse that the patient must go to bed, curettage should be performed in the hope that it will stop the profuse bleeding until the menopause occurs If curettage is unsuccessful, one has a choice of irradiation or hysterectomy, preferably through the vagina Opinion is divided on this subject. Several gynecologists have abandoned irradiation for benign uterine bleeding at the menopause, because in some cases cancer of the endometrium appears several years later

SLEEPING PILLS

To the Editor —*I see an increasing number of patients who tell me that they have been taking sedatives at bedtime for years some as long as 15 years the usual sedative is pentobarbital (nembutal®) sodium What harm could come from such long usage? What is your opinion of the use of sedatives in the coronary patient? None of these persons seems to be a true addict but they feel that the use of a sleeping pill is better than fighting sleep* M D Illinois

This inquiry was referred to two authorities, whose respective replies follow —Ed

Answer —It is only occasionally that the use at bedtime of a sedative such as pentobarbital (nembutal®) sodium leads to an untoward result Long use of a small dose is not harmful For pathological changes to be produced in the central nervous system, it is necessary to give very large doses of a barbiturate over a period as long as a week Occasionally a patient who is not stable emotionally will take an overdose of a barbiturate with suicidal intent, but it is unlikely that a physician would prescribe barbiturates for such a person for very long Small doses of barbiturate for persons who have coronary disease are justified by the rest that the patient obtains thereby A few persons have an idiosyncrasy to barbiturates that prevents them from obtaining any real benefit from them, that is, such persons may become excited rather than quieted by the drug

Answer —As long as modern civilization makes life strenuous, many persons will need help in getting sleep Some experts say they have seen patients who appeared to be typically habituated to sleeping pills, however according to one observer, in 45 years of busy practice, he has seen no harm from the long continued use of sleep-makers During these years he has seen only a few persons who were taking excessive amounts of these drugs, and they were all psychopaths when they began taking the drugs They were able to stop the use of the drugs without difficulty Nervous persons should take sleeping pills only at night when they need them

MULTIPLE MOLES

To the Editor —*A white woman, married, 25, has small pigmented moles scattered on her body In the past two years, two small nevi have been removed because of recent appearance and increase in size—one from the palm of the hand 1 mm in diameter, and one from the shoulder 3 mm in diameter She now has a pigmented mole about 3 mm in diameter, on the skin of the antecubital fossa this has doubled in size in about one month The pathological report on two excised lesions was junction nevus no malignant change 1 Should each pigmented mole that increases in size be removed? 2 What is the prognosis? 3 Will pregnancy have an unfavorable effect?* M D Virginia

Answer —The junction type nevus is one that is prone to become malignant Not all such nevi do become malignant, so that opinion is divided as to whether they should be excised routinely When they show signs of activity, however, such as change in size, shape, or color, or if they are situated in areas that are subjected to repeated irritation, the better course is to excise them It is impossible to predict whether pregnancy will have an unfavorable effect on the lesions It should be remembered that nearly all persons have at least one mole somewhere on the body, so that the incidence of malignant change in them must be very low

TERRAMYCIN

To the Editor —*Are there any contraindications for the intraperitoneal administration of terramycin solutions?*

W J Denman M D , Warm Springs, Ore

Answer —A search of current literature does not reveal the indications or the contraindications for the administration of terramycin solutions by the intraperitoneal route

THE JOURNAL

of the American Medical Association

COPYRIGHT 1951 BY AMERICAN MEDICAL ASSOCIATION

THE GENERAL PRACTITIONER AND THE HOSPITAL

CHAIRMAN'S ADDRESS

Lester D Bibler, M D , Indianapolis

Before delving into the present problem of the general practitioner and hospital staff privileges, I should like to say something about the history of the problem, to show why the general practitioner is so much more concerned today than he was many years ago about his relationship to the hospital

Back in the horse-and-buggy days the family doctor was regarded as the important man of medicine He was friend and advisor, as well as doctor, to his patients, and the home was his area of practice The specialist was an awe-inspiring gentleman in a Prince Albert coat, who was seen but rarely, and when he was called into the home for consultation it meant that "mother was really in a bad way "

That picture slowly changed, and gradually the public came to regard the specialist as the guaranteed competent man in his field, while the general practitioner was a fellow who gave insurance "physicals" and dispensed prescriptions for simple aches and pains, a man to be by-passed if one could diagnose for himself just what specialized part of his body was ailing and refer himself to the proper specialist

In short, the general practitioner was out of style This attitude towards general practice was not only shown by the layman but was reflected in such places as military service, where the young man with a specialty diploma went into military medical service with a far better chance of promotion than the older clinician who had no board certificate

The effect on the young man of medicine of the various attitudes was such that he often felt he owed it to himself to specialize Otherwise, he might be accused of wasting his talents, of stunting his medical education, of having no ambition

Today a different attitude is apparent In the past few years there has been a reaction against over-specialization, not only among the physicians but also among laymen Part of this has been owing to the increasing difficulty of rural and small urban communities to obtain adequate medical care, and the realization that these communities needed men who could practice the wide range of medicine, surgery, and obstetrics In short, there was a need for the general practitioner, especially the young general practitioner Hence there has been a demand that medical schools turn out more "country doctors" and family physicians

The realization of the need for more doctors equipped to manage a general practice has been accompanied with a growing rediscovery of the unique values of the general practitioner One of the reasons for this new appreciation is the growth of interest, on the part of laymen as well as doctors, in the "new" subject of psychosomatic medicine Older persons, studying the kernel principle of psychosomatic medicine—"treat the whole patient, the mind and the body together"—realized that that was just what the old family doctor used to do all along

More and more persons today express the need for a physician whose training qualifies him to treat the whole patient, as well as serve as the family doctor There is a growing demand for the general practitioner, the man who knows his families, knows their history, knows their resources and what they can afford, and knows his medicine and is able, when necessary, to call in the right specialist for consultation

It has been agreed then that there should be more personal medicine and that the family physician should act more like the reliable old horse-and-buggy doctor But people are just beginning to realize that the general practitioner can no longer dispense healing from his buggy Times have changed Doctor and patient see more and more of each other in the hospital and less at the home bedside

A few statistics will show what has happened In the last 20 years, births in hospitals have increased from approximately 600,000 to over 2,800,000, an increase of more than 450% And hospital admissions, of all classes of patients, have just about tripled in the same period of time

---

Read before the Section on General Practice at the One Hundredth Annual Session of the American Medical Association, Atlantic City June 13 1951

There are, of course, many factors which have made the hospital more and more important as a place of treatment One of these is the growth of hospital insurance plans which make hospitalization accessible to a greater number of people Another is the development of new and more potent methods of therapy which can be used properly only in the hospital's environment of continuous watchfulness and high-quality care

What does this mean? It means that the general practitioner of today, if he is to serve his patients as the old family doctor did, must have access to the hospital as an area of therapy where he can apply his modern knowledge to the treatment of his patients

It has been said that, "A doctor in private practice without access to a hospital is like a carpenter without tools" This pretty much describes the plight of many general practitioners who have no hospital staff appointments

Many general practitioners have discovered that they are treated very much like the new father who peers through the protective glass window of the hospital nursery—on the outside looking in They have found that many hospitals regard them pretty much like an expectant father, whose function is completed before the patient enters the hospital

Probably the three biggest problems the general practitioner has today are the obtaining of a hospital staff appointment, the admission of his patients to the hospital when he has a staff appointment, and the opportunity to perform such procedures in the hospital as he is qualified by training and experience to do

A great deal has been written and spoken on why the general practitioner finds it difficult to gain acceptance in the hospital The most frequent answer is that the hospital has become "board-minded" But why have hospitals become "board-minded"?

From what I have read and heard and experienced, there seem to be two prominent reasons, both owing to the hospital's desire to make itself the best institution possible

One reason is that many hospitals wish to make available to the public the most skilled services possible, and it is easy to decide that no staff could give better medical service than a staff of specialists So, many a well-intentioned hospital has limited its active staff to specialists, not realizing that it has done a disservice to the community by not allowing the general practitioner to practice all his skills

The other reason is the desire of hospitals to make themselves acceptable for residency training in order to encourage interns to continue service To be acceptable for a residency in a particular department, a hospital has had to have a diplomate of the appropriate specialty board serve as head of the department. So, ambitious hospitals find themselves with a board member heading every department. The general practitioner's trouble comes when the department head, in determining the rules of his department, has to decide who may practice in his department.

The department head has two choices He can set up a committee to study the qualifications of individual doctors to perform specific procedures in any department This means many headaches and much work Or, he can take the simpler way out and say that doctors can practice in his department if their qualifications are already attested by board certification or by membership in some specialty society This means far fewer headaches and much less administrative work

Adopting the simpler method of course means that, without any malice toward them, the general practitioners will be left out in the cold, the unfortunate victims of good intention

In the past five or six years there has been persistent study of the status of the general practitioner and of his role on the hospital staff From that sifting and winnowing, conducted not only by general practitioners, but also by hospital officials, the specialty advisory boards, the American Medical Association, and others, three principles have crystallized These are as follows

1 Any physician who is qualified to practice medicine and who is licensed and reputable deserves a hospital staff appointment

2 A doctor should be allowed to perform in the hospital any procedures he is qualified to perform as determined by his professional colleagues of the hospital, rather than on the basis of certification or special society membership

3 The hospitals have a responsibility to make available facilities and opportunities for graduate self-training within the hospitals, so that modern standards may be advanced by general practitioners as well as by specialists

These principles are to be found again and again in the articles and talks devoted to the subject of the general practitioner and the hospital What is being done to apply these principles to practice? A great deal has been done and is being done, and we hope more will continue to be done to implement these principles

To return to the first principle, that every qualified doctor should have a staff appointment, no hospital wishes to change its department standards to include the general practitioner since there seems to be danger that its residency qualifications might be impaired In this situation the answer to the problem of integrating the general clinician into the hospital staff is the general practice department or section Many hospitals have already found that such a section provides properly for appointments of general practitioners without radical change of staff organization Through it the general practitioner has a voice in staff government.

In 1946 the House of Delegates of the American Medical Association adopted a resolution encouraging hospitals to establish general practitioner services "Such a general practice section," the resolution read, "shall not *per se* prevent approval of a hospital for the training of interns and for residencies"

Concerning the second principle, that rather than impose arbitrary limitations a doctor should be permitted to perform that which he is qualified to do, I think that it is very difficult to put forth an argument to deny a man the right to perform that in which he is qualified If it means letting him do those procedures in the hospital, then he must be permitted to do them there If he is frustrated in his attempts to give his patients the best care, the doctor will either lapse into unambitious lethargy, or he may perform those procedures he knows in irregular institutions and attempt to perform others in which he is not yet skilled The hospital is the place for all but the simplest of surgical procedures It is there that the general practitioner must be allowed to perform the procedures in which he is skilled, and it is there that he should learn under skilled supervision those procedures which he wants to learn

This brings us to the third principle, that of providing the general practitioner with the opportunity to continue his postgraduate self-education in the hospital This means not only providing opportunities for present general practitioners to find the answers to their scientific questions, but also providing training for the young doctors who will become the general practitioners of tomorrow, through association under general practitioners in teaching hospitals

No hospital wishes to lower the standards of the care available to the community Therefore, it is to the hospital's advantage to offer a continuous educational program for the general practitioner, so that he is kept constantly abreast of new developments

A very interesting educational experiment is being conducted at the Rochester (N Y) General Hospital The general practitioners' training program permits doctors to be better general practitioners, also, the doctor who would like eventually to limit his practice to one field of medicine may take more and more specialty work at the hospital When he has advanced sufficiently, he may change his appointment to a specialty division

Of course, we don't want all our general practitioners to become specialists, but it is encouraging to see well-planned programs like that of the Rochester General Hospital, which enable the general practitioner to advance himself as he desires

The general practitioner's place in the hospital postgraduate education program is not just as a receiver of knowledge He is not only a voluntary student, but a promising teacher as well The general practitioner has already been integrated into the teaching staffs of some medical schools in order to bring the student the general practitioner's slant on medical practice, and the general practitioner has also been invited to participate in teaching in many hospitals The members of the general practice department who have teaching ability should be encouraged to participate in departmental meetings and in the teaching activities of the hospital staff The value of having the general practitioner on the teaching staff of a hospital which offers a general practice residency is recognized, but the general practitioner is also a valuable man on the teaching staff of any hospital He is well-fitted by his wide scope of medical activity to guide a house staff in subjects such as medicine as an art, in medical economics and medical ethics, and in community and industrial health facilities He will be able to give the intern an impression of what general practice is like, knowledge of which interns, as well as medical students, lack to a great degree Both groups work and study in an atmosphere pervaded by the promise of specialization, so that it is no wonder that in such an environment a young doctor thinks more often of going into a specialty than he does of entering general practice

If the young men who are needed to go into small-town practice are to get an inkling of what general practice is like, they must not only be shown the medical school's interest in training doctors for small-town general practice but also should be exposed to general practice and general practitioners in their internship and residency at the hospital

I am happy to say that a great deal of promising work is being done now It is gratifying to see some of the medical schools stressing general practice in their schools and setting up general practice residencies in their university hospital Other general hospitals are organizing general practice departments, setting up general practice residencies, and are exploring the field of continuing postgraduate education for general practitioners The American Academy of General Practice has shown its constructive value, as evidenced in part by its "Manual on the Establishment and Operation of General Practice Department in Hospitals " Medical societies and hospital groups have held symposia to discuss the integration of the general practitioner into the hospital staff And this Section on General Practice of the American Medical Association has served as a valuable example of the general practitioner's place in medical organization

I have not previously mentioned the problem of the hospital standardization program It is as yet unsettled But I will close with the sincere expectation that when it is decided what body shall operate the hospital standardization program, the general practitioner will be justly represented on it, and that that body will affirm the following three principles that every reputable physician should have a hospital staff appointment, that every staff physician be entitled to perform in the hospital those procedures in which he has demonstrated his proficiency, and that the hospital should provide the opportunity for every physician, general practitioner and specialist, to perfect himself in his art

445 N Pennsylvania St

Metabolism —The modern science of metabolism may be taken to date from the experiments of Lavoisier, carried out toward the end of the eighteenth century He demonstrated that animal heat was the result of the oxidation of carbon in the body, and compared the process to the burning of a candle or any other combustible material The process in either case involved the consumption of oxygen and the formation of carbon dioxide Lavoisier and the physicist Laplace placed a guinea pig in a closed chamber and determined the quantity of carbon dioxide eliminated in a 10 hour period The same quantity of carbon dioxide was found to be produced by the animal's body as when 3 3 grams of pure carbon were burned in air The guinea pig was next placed in a closed space surrounded by ice The heat given out by the animal s body during a 10 hour period was calculated from the quantity of ice which had melted Three and three tenths grams of carbon burned in a similar ice calorimeter were found to generate an amount of heat comparable with that given off by the animal It was therefore concluded that the heat generated by the animal and the carbon dioxide eliminated by the lungs were the result of the combustion of approximately 3 3 grams of the body s carbon Thus, the parallelism between the amount of heat generated in the animal body and the quantity of carbon dioxide eliminated was demonstrated —Charles Herbert Best M D , and Norman Burke Taylor, M D , *The Physiological Basis of Medical Practice,* The Williams & Wilkins Company Baltimore, 1950, p 607

SURGICAL PROBLEMS OF DUODENAL ULCER

Frederic W. Bancroft, M.D., New York

Dr. Kellogg Speed once described fracture of the neck of the femur as the unsolved fracture. Duodenal ulcer may well be termed the unsolved ulcer. It has become more and more of a problem of surgical therapy and, even with the best of surgery, unforeseen complications may result.

There are, I believe, four definite indications for surgical intervention. They are (1) massive gastric hemorrhage, which demands an immediate operative procedure in order to save life, (2) recurrent hemorrhages of sufficient moment to have exsanguinated the patient despite adequate and prolonged medical care, (3) gastric retention, with persistent vomiting of food retained for a considerable period—manifested on physical examination by an audible splash and on roentgenologic examination by deformity in the region of the pylorus and evidence that the stomach does not empty itself and is becoming definitely dilated, (4) pain that has not been relieved by thorough medical therapy, including bed rest.

If these indications for surgical therapy are accepted, the surgeon should attempt to do the following: (1) remove the ulcer if possible, (2) excise the gastric antrum or its mucosa whenever possible, because it has been definitely shown that the antrum produces a hormone, gastrin, which activates the acid-forming cells of the cardia, (3) provide a free reflux of bile into the stomach.

Boyd has adequately shown that in the normal stomach, during the latter part of digestion, acidity is diminished by the reflux of bile and alkaline juices through the pylorus. He has demonstrated this not only by gastric washings but also by adequate radiographic studies of gastric motility. In duodenal ulcer there is a spasm of the pylorus, reflex in origin, but also possibly caused by scar-tissue infiltration of the pyloric ring. It is for this reason that there is higher acidity in duodenal ulcer than in gastric ulcer, and this higher acidity must, of itself, influence therapeutic measures. In order to allow a satisfactory alkalinization, it is advisable to have a vertical stomach with adequate bile reflux and fairly rapid emptying time. This prevents the accumulation of too much acid within the stomach itself.

It is because of the above aims that surgery in duodenal ulcer has become a much more radical procedure than it was in the past. Formerly, pyloroplasties would not allow the free reflux of bile into the stomach. They did not remove the pyloric antrum, and, while occasional cures resulted from pyloroplasties, the percentage of cures was too low. The same was true of gastroenterostomies. Gastroenterostomy does not remove the antrum, and it does not allow a sufficient stoma for the neutralization of the gastric juices during the latter part of digestion. While a subtotal gastrectomy is a major procedure for a duodenal ulcer, it becomes the operation of choice when the fact is accepted that only medical failures are subjected to surgery.

Let us discuss the first-mentioned indication for surgery, acute gastric hemorrhage. There are some patients who bleed so excessively that transfusions will not control hemorrhage and immediate gastrectomy is necessary.

There has been great improvement during the past five years in both the medical and surgical therapy for massive hemorrage from the duodenum. For instance, Dr. Harold D. Harvey at the meeting of the New York Surgical Society on Feb. 8, 1950, reported that during the period from 1930 to 1937, of 6 patients who had emergency operations for severe gastric hemorrhage, four died—a mortality of 66.7%—whereas, in 1948, 15 patients with a similar condition were operated on and only 1 died—a mortality of 6.7%. However, this diminished mortality does not mean diminished morbidity, since, of the 14 patients who survived, five had serious complications after operation, as follows: (1) duodenal stump leak—secondary hemorrhage controlled by second operation, (2) probably multiple emboli—severe paralytic ileus, (3) wound disruption with evisceration—jejunal fistula, with operation to relieve this, and mild postoperative bleeding, (4) secondary hemorrhage, probably from ulcer—massive thrombophlebitis with pulmonary infarct, (5) biliary fistula (possibly from a gallbladder that was opened at operation).

While only one of the 15 patients died, if all had not been under good hospital care and surgical observation, the mortality would probably have been much higher.

INDICATIONS FOR SURGERY

Recurrent Hemorrhages.—When a patient who comes to a surgeon for consideration of operation has, in his past history, had at least two massive hemorrhages, it is much better to recommend operation than to wait for the next hemorrhage and then have to perform an emergency procedure with greater risk. It has been shown that if surgery is necessary there is no operation that will prevent the recurring hemorrhage except subtotal gastrectomy. In other words, one has to perform an operation of considerable magnitude on a patient who has bled profusely. Unfortunately, there is no minor procedure that guarantees the patient's recovery and prevention of continued hemorrhages.

Gastric Retention.—The retention of barium sulfate in the stomach for more than six hours is definite indication for a surgical procedure. Gastric retention often occurs in the older age group. In fact, in a recent summary, it was shown that 30% of duodenal ulcer patients may be over 60 yr. of age when they have their first symptoms. When there is a definite scar-tissue ulcer, nonactive, patients in this group do well with gastroenterostomy. For the younger age group, subtotal gastrectomy is advocated.

Unrelieved Pain.—Constituting by far the largest percentage of cases referred to the surgeon are the patients who have been on adequate medical therapy, which has often included bed rest, but who still have persistent pain and subacute attacks that mean hospitalization and diminished productivity Assuming that surgical therapy is decided on in this type of case, what operative procedure should be considered and what are the dangers associated with it?

As only medical failures are now being operated on, the radical subtotal gastrectomy has become the operation of choice There are, however, certain hazards in this procedure that bear discussion The most important immediate postoperative hazard is rupture of the duodenal stump There are probably several reasons why this occurs The first and most important is back pressure from the afferent loop of the gastrojejunostomy following resection When one realizes that about 1,500 cc of bile and pancreatic juice is secreted in 24 hr , one can readily see why obstruction of the afferent loop with back pressure can cause a rupture The Hofmeister type of anastomosis, because it diminishes the size of the stoma that is present in end-to-side anastomosis, is of advantage because it allows the tacking up of the afferent loop before it enters the stoma and thereby may prevent kinking

Assuming that one cannot do a satisfactory closure of the duodenal stump because of edema or the low position of the ulcer in the second part of the duodenum and the operator fears injury to the common duct, what precautions should one take? In this type of case Lahey has advised opening the common duct and passing a tube downward through the papilla of Vater so that the operator may readily recognize the position of the duct Opening the duodenum wide, inserting a sponge and seeing how far below the transection one gets bile on the sponge, is also an aid When one finds difficulty in satisfactory closure of the duodenal stump, Whipple has advocated inserting a catheter into the end of the stump, anchoring it with a purse-string suture and possibly inserting a second purse-string suture with inversion The distal end of the catheter is then drawn out through a stab wound This creates primarily a duodenal fistula, but in the cases in which this has been done there has been no persistent fistula after withdrawal of the catheter in the later postoperative stage When the ulcer has had to be shaved off the head of the pancreas, there is always danger of pancreatic drainage, and I believe that in practically every case of subtotal gastrectomy a drain should be inserted to the duodenal stump and possibly anchored

In a recent case at the Bronx Veterans Hospital, a duodenal ulcer patient was lost because of insufficient drainage to the duodenal stump Evidently, in the closing the drain had migrated upward It was not in the region of the stump, and a large subhepatic biliary abscess caused the death of the patient.

Whipple advocates a sump type of drain to the duodenal stump This drain should be anchored by one stitch in the neighborhood of the stump so that it cannot migrate because of the closure of the wound or the postoperative vomiting and distention I believe that, in general, if the gastrojejunostomy has been carefully performed without tension and with satisfactory mucosal and serosal sutures, infection or leakage from the stoma is a relatively rare complication

In 1931, because we were perturbed by the relative frequency of duodenal stump ruptures and had learned that the Finsterer operation of pyloric exclusion had not met with favorable results, it occurred to Lewis Gregory Cole and myself that, if the mucosa of the prepyloric end of the stomach could be coned out, two purposes could be accomplished 1 The acid hormone-producing mucosa of the antrum could be excised 2 A firm, strong muscularis suture proximal to the pylorus in the antrum of the stomach could be made possible

We had tried the Finsterer pyloric exclusion operation on dogs without coning out the mucosa and had found that a blind gastric pouch filled with bile and gastric juice resulted, which was accompanied by a marked inflammatory process of the mucosa We therefore developed a procedure that we called "A modification of the Devine Operation of Pyloric Exclusion "

When I published this procedure in 1932, I reported the follow-ups on 14 cases I have done many since then I have used this procedure only when it seemed to me that the following two dangers offered more hazard to the patient than did the operation of pyloric exclusion (1) dissection to free the ulcer penetrating into the pancreas and (2) rupture of an insecure closure of the duodenal stump I agree that when the ulcer can be removed with safety subtotal gastrectomy is the operation of choice, but in 10% to 20% of cases of duodenal ulcer the danger of excision of the duodenum adds to the mortality risk of the patient

In the October, 1949, issue of the *British Journal of Surgery* Makkas and Marangos report their results with what they call the Bancroft-Plenk method of antral exclusion, which they use in difficult cases Plenk's modification was published in 1936, four years after mine, and the only variation I can find is that he does not try to invert the serosal surface of the antrum but places two purse-string sutures in the muscularis of the antrum I had described placing two purse-string sutures in the muscularis and a third one to invert the serosa in order to prevent adhesions Since the original description in my paper, I have modified my procedure in that I resect the middle third of the stomach This allows me to do as complete a subtotal gastrectomy as one does with the radical procedure and to utilize the Hofmeister modification I transect the stomach distally about 3 in (7 62 cm) proximal to the pylorus, excising the middle portion This allows sufficient space at the antrum to cone out the mucosa down to the pylorus and to close the stump adequately with two layers of purse-string muscularis and a third inverting serosal suture

Makkas and Marangos state that at the Makkas Clinic the Bancroft-Plenk operation was performed upon 243 patients with a mortality of 2 3% Plenk has reported a mortality of 2 6% in 116 cases operated upon by this method

Paraskevas and Sapkas, in 1948, reported follow-ups on the operation of exclusion without removal of the pylorus All of their patients did very well Some of them put on weight up to 25 kg and were able to return to their original jobs No suspicion of recurrent ulceration was noted in the cases followed

My own follow-ups have been similar to those described by Paraskevas and Sapkas, and I have had one patient with marginal ulcer who was taken care of at another hospital The remainder of the patients have done as well as any of those on whom I have done the radical operation, and the mortality has been less

Makkas and Marangos also state in their article that there are certain nonexcisable types of duodenal ulcer Many surgeons will concur because it is known that if such a duodenal ulcer is excised, a duodenal fistula or a biliary subphrenic abscess may result

There has been a marked variation of opinion in the last few years as to the value of retrocolic or antecolic type of anastomosis At least 10 yr ago practically every operation was done by the retrocolic method Then came a period when the antecolic method was advised because edema of the mesocolon created stricture in the stoma My own experience and the experience of many other surgeons has been that there are just as many complications from the antecolic procedure The stoma may become adherent to the abdominal wall Kinking of the afferent and efferent loop is as likely to occur in the antecolic, as in the retrocolic procedure Moreover, in most people, this method necessitates a rather wide resection of the omentum because the omentum may twine around the stoma and create an obstruction, and if it is a fatty omentum it must be resected in order that sufficient intestine may anastomose with the gastric stump without tension It is true that if a secondary procedure has to be performed the antecolic is easier to approach than the retrocolic, but I do not think that this is sufficient reason to adopt the antecolic anastomosis Physiologically, if the retrocolic stoma works satisfactorily, a short jejunal loop with less antiperistaltic reflux gives a better-functioning stoma and the patients have less distress from gas

In a gastrojejunostomy, as with any anastomosis on intestines, there should be a proximal vent to relieve gas and fluid distention A Levin tube has proved a lifesaver as a postoperative treatment following gastric resection It can, however, fail to function if not thoroughly watched To insert a Levin tube and place the patient on Wangensteen suction may prove a boomerang The openings in the Levin tube may fill with blood clots, and one may be lulled into false security in feeling that the stomach is being properly decompressed I personally prefer not to use the Wangensteen suction but, rather, to place the patient on irrigations with isotonic sodium chloride solution and suction every two to three hours postoperatively and to allow gravity drainage to take place between these procedures

Having passed the first seven or eight postoperative days after resection, there is still another hazard that one may encounter Often, after an increase of the diet on the sixth or seventh day, the patient starts vomiting, and if a Levin tube is inserted one is surprised at the amount of retention that can occur in a stomach that, in the operator's opinion, has been resected by at least three-fourths I have seen 1,000 cc recovered from a stomach that I would have felt would not hold more than 300 cc When this complication occurs, it is usually due to edema of the stoma, and the patient must be put on parenteral feeding and repeated gastric lavage This complication may persist for several days, and it tries a surgeon's soul to decide whether or not there is a definite obstruction to the efferent loop that needs operative intervention If one has the patience to wait, in many of these cases there is recovery without operative intervention

During this period of waiting, the surgeon must be certain that there is sufficient protein intake to prevent hypoproteinemia and that there is not a sodium-potassium shift Sodium is the main component of tissue fluids, whereas potassium is the main component of the individual body cell With persistent diarrhea, prolonged shock or alkalosis, potassium may escape from the cell and its position be occupied by sodium This is followed by profound weakness, cyanosis and definite electrocardiographic changes All of us have lost patients we could have saved if we had had the knowledge to give potassium intravenously when this complication occurred

In the October, 1949, issue of the *British Journal of Surgery,* Andrew Muir describes postgastrectomy syndromes, and if the results were all as poor as he indicates in this article, I believe that most of us would give up the operation He analyzes the symptoms of 124 patients who had undergone subtotal gastrectomy Prof C F Illingworth performed 92 of the operations in the Western Infirmary, Glasgow, Scotland, and the remainder were done by Mr W J M Brandon at Law Hospital, Lanarkshire Muir classified the symptoms into six groups in the following order of incidence and importance (1) the dumping syndrome, (2) failure to gain weight after operation, (3) psychoneurotic symptoms, (4) bilious regurgitation and vomiting, (5) hypoglycemic attacks, (6) deficiency syndromes

Muir states that 90 patients out of the 124 followed, or 72 6%, suffered from the dumping syndrome Fifteen of these were unable to resume work for an average period of five months following operation He theorizes on the probable causes, and he believes that rapid dumping with dilatation of the efferent loop is probably the main cause Studies of blood sugar did not show hyperglycemia followed by hypoglycemia during the dumping syndrome As this high percentage of dumping syndrome is much higher than has been my experience, and as statistics from the follow-up system at the Veterans Administration Hospital, Bronx, N Y , show an incidence of 10% with only moderate symptoms, I believe that avitaminosis and the poor postoperative diet the patients have in Scotland may have been a factor

No cure-all has been found for the dumping syndrome Small, frequent meals, fluid restriction at meals and the recumbent position after eating may have aided the relief of this important syndrome Fortunately the symptoms usually diminish after several months

The majority of the patients reported by Muir who suffered from this distressing symptom had had antecolic gastrojejunostomies with rather long afferent loops He states that three of the patients were cured by the second operation of jejunojejunostomy between the afferent and efferent loops and also states that a loop in the antecolic gastrojejunostomy creates a long proximal segment into which food readily passes, and symptoms very similar to those of the dumping syndrome are attributable to the duodenal distention so caused

Several years ago, Dragstedt, after some interesting experimental work, suggested that the ideal treatment of duodenal ulcer when there was no gastric retention was section of the vagus nerve This operation is popularly known as vagotomy Dragstedt reported a fairly large group of patients who had had resection of the anterior and posterior branches of the vagus nerves as they accompany the esophagus In his early work he did a transthoracic approach and did not perform operations on the stomach itself Later, he changed to an abdominal approach and did the section of the vagus nerves below the diaphragm and performed a concomitant gastroenterostomy This procedure was taken up by many surgical clinics with the hope that minor procedures with less risk could be performed on patients with duodenal ulcer

Shortly after Dragstedt's papers were presented, we at the Bronx Veterans Hospital thought it would be satisfactory clinical research work to operate on patients with duodenal ulcer by the transthoracic approach in order that we might properly evaluate this procedure We were certain that the two vagus nerves could be better resected from above the diaphragm One would not be tempted by this operation to do any plastic work on the stomach or duodenum The cases were brought up for discussion with the residents The indications for vagotomy were recurrent symptoms of duodenal ulcer Patients thus afflicted had not responded to medical therapy and had shown no evidence of gastric retention Also, it was considered advisable to accept only those patients who had a high night secretion of gastric juice Immediate follow-up results showed that there was complete or nearly complete relief of ulcer pain Twelve-hour overnight secretion that had averaged 970 cc preoperatively was reduced to 290 cc in the early postoperative period Maximum free hydrochloric acid values in the overnight specimen dropped from an average of 44 units to 24 units postoperatively

Sauer and Healy have published a careful follow-up analysis of 50 cases of vagotomy performed by the transthoracic method I shall not go into the details of these follow-up reports and refer you to their excellent article in the *Annals of Surgery*, December 1949 However, I should like to mention the main complications A feeling of fullness in the epigastrium, belching pyrosis, regurgitation and vomiting were noted in varying degrees of severity in 80% of the patients early in the postoperative course There were associated loss of stomach tone, gastric enlargement, diminished peristalsis diminished gastric contents, and delay in emptying time In five patients or 10% such severe and unrelenting atony developed early in the postoperative period that further surgery was necessary Gastric resection was performed on four of these five patients 3 to 15 weeks postoperatively after strenuous efforts with the use of gastric suction and bethanechol chloride (urecholine®) had failed

All of the patients operated on and studied in this follow-up analysis were readmitted to the hospital at various times so that gastric analysis and late radiological studies could be done The conclusions of the examiners were as follows

> According to our data a patient who is subjected to vagotomy has one chance in five of securing complete relief, two chances in three of being benefited to some extent, and one chance in three of failure—all within an average of 18 months postoperatively For this rather dubious benefit he must accept a small but nevertheless significant mortality risk and the unhappy prospect that his continued freedom from ulcer symptoms is by no means assured Half the time he must also pay an additional premium in the form of persistent symptoms of gastric atony which not infrequently may be more disabling than the original ulcer
>
> On the whole, we feel that vagotomy, even in carefully selected cases, has not proved successful in a sufficient number of cases to justify its routine use Despite the lower operative mortality, failures are too frequent and morbidity too serious after vagotomy to justify its replacement of other proved more effective methods of surgical treatment

CONCLUSIONS

In properly selected cases, I believe that subtotal gastrectomy is the operation of choice in duodenal ulcer

The operation is one of considerable magnitude and demands careful preoperative treatment, excellent anesthesia, meticulous operative technique, and constant and wise postoperative observation

In the nonresectable ulcer, the operation of pyloric exclusion with excision of the antral mucosa will save lives

Vagotomy, save in some cases of gastrojejunal ulcer, has not justified our early hopes

16 E. 90th St.

William Beaumont.—Beaumont published his book himself and had it printed in Plattsburgh, the first copies coming from the press in November, 1833 It is entitled "Experiments and Observations on the Gastric Juice and the Physiology of Digestion" and the heading continues 'by William Beaumont, M D , Surgeon in the U S Army, Plattsburgh Printed by F P Allen, 1833 " In the preface, the author states that his experiments 'are made in the true spirit of enquiry, suggested by the very extraordinary case which gave me the opportunity of making them I had no particular hypothesis to support, and I have therefore honestly recorded the result of each experiment exactly as it occurred I had opportunities for the examination of the interior of the stomach, and its secretions, which has never before been so fully offered to any one " The introduction narrates the story of St Martin s accident, recovery and association with Beaumont from 1822 until 1834 In addition, there are brief sections describing the method of withdrawing gastric juice, the valve which closed the fistula and the appearance of the interior of the stomach

The book attracted favorable attention both in this country and abroad The appearance of the book established Beaumont s reputation as an investigator —Arthur H Smith, William Beaumont (November 21, 1785—April 25, 1853), *Journal of Nutrition* May, 1951

VAGOTOMY VERSUS GASTRIC RESECTION

COMPARATIVE EVALUATION OF RELATIVE EFFECTIVENESS IN A CONTROLLED SERIES OF CASES

Martin J Healy Jr , M D , Sidney J Hellman, M.D
and
Paul K Sauer, M D , New York

What surgical procedure should the surgeon advise for the patient with intractable peptic ulcer? Despite an unusually voluminous literature, there is still considerable disagreement on this question among surgeons and clinics throughout the country The procedures generally advocated are gastroenterostomy, subtotal gastrectomy, and vagotomy—either alone or in combination Most teaching clinics are in general agreement that gastroenterostomy alone should be reserved principally for the inactive ulcer with obstructive symptoms, in the presence of low acid values, and for occasions when the general condition of the patient makes gastric resection inadvisable

The effectiveness of radical subtotal gastrectomy in controlling the symptoms of intractable ulcer has been amply established by numerous reports with careful and prolonged follow-up studies [1] The status of this procedure as the surgical treatment of choice has in recent years been challenged by vagotomy, either alone or in combination with gastroenterostomy Emphasis has been placed upon a low mortality rate, effective control of symptoms, and avoidance of certain of the unhappy sequelae of gastric resection

A careful and comprehensive study of the present status of vagotomy has been recently published by Trimble and Lynn [2] to which the reader is referred for a complete bibliography A review of the literature indicates that much of the early enthusiasm for vagotomy has abated The accumulation of careful follow-up studies over a period of years is likely to show that the indications for vagotomy in the treatment of peptic ulcer will be considerably limited

In this discussion we shall limit ourselves to a comparative evaluation of radical gastric resection and vagotomy Furthermore, we will consider only cases in which vagotomy alone was performed to include vagotomy in combination with other surgical procedures serves only to confuse the issue We feel that this limitation is necessary and fair since the addition of other variable factors, particularly so definitive a one as gastroenterostomy, may obscure the long-term effect of nerve section alone upon the ulcer process Although much has been written regarding the effectiveness of both gastric resection and vagotomy, very few reports compare the two procedures in anything resembling a controlled series of cases [3]

In a comparison of the effectiveness of any therapeutic methods, it is most important that the treated groups be comparable insofar as possible Under ideal conditions, patients in the various groupings should have entirely like characteristics and should differ only in the specific treatment they receive while under study Such factors as age, race, sex, duration of illness, and severity of symptoms obviously may influence the final evaluation either individually or collectively The more the groups are alike in such characteristics, the more significant will be the final comparison One must avoid the pitfall of comparing the results of different groups of investigators unless the criteria for evaluation are known with certainty One reporter's "good" result may be another's "fair" rating and be considered as a "failure" by a third In order to achieve statistical validity not only must the initial selection of cases be carefully controlled but the same criteria of success or failure must be utilized to judge the final results

In a review of reports, attention should be directed not only at the duration of the follow-up but also at the percentage of total cases followed Statistically valid deductions frequently cannot be made from observations of a limited number of the treated group, since factors other than chance may play a large role in determining which patients appear for follow-up examinations In a recent report [4] of 532 consecutive cases of duodenal ulcer, satisfactory follow-up information was secured in only 72 9% of them The accuracy of the analysis of the reported cases is unquestioned, but one may well wonder if the same proportion of good and bad results prevailed in the rather substantial unknown group

Any haphazard compilation of the reports of various clinics without regard for such basic consideration can lead only to conflicting and confusing impressions Much more useful information is likely to be derived from a smaller group of observations in which proper controls

---

Mrs Ethel Skutch of the Follow Up Clinic compiled much of the data presented in this paper

Since the original submission of this paper for publication the average follow-up period for both groups has been extended to four years without significant alteration of the end results observed.

Reviewed in the Veterans Administration and published with the approval of the Chief Medical Director The statements and conclusions published by the authors are a result of their own study and do not necessarily reflect the opinion or policy of the Veterans Administration

CLINICAL MATERIAL

The material for this series consisted of 263 consecutive subtotal gastrectomies and 54 consecutive vagotomies performed during the four-year period from 1945 to 1948, inclusive This represents the total number of operations of each type performed during this time at the Veterans Hospital, Bronx, New York Gastric resections were performed for the following surgical indications duodenal ulcer, elective, 166, duodenal ulcer, emergency massive bleeding, 2, marginal ulcer, 9, benign gastric lesions including ulcer, 39, cancer, 47 Vagotomy was performed 43 times for duodenal ulcer and 11 times for marginal ulcer The problems of emergency hemorrhage and cancer are not within the scope of this paper We have not performed vagotomy for gastric ulcer for fear of leaving behind a malignant lesion Accordingly, we shall only briefly touch upon the results of subtotal gastrectomy for gastric ulcer and confine the major portion of the discussion to duodenal and marginal ulcer We have, therefore, 166 consecutive cases in which patients with duodenal ulcer were treated by gastric resection and 43 cases in which patients were treated by vagotomy In this latter group we have eliminated two cases of vagotomy that were combined with other surgical procedures In the second category we have nine consecutive cases of marginal ulcer in which gastric resection was done and 11 cases of vagotomy

DUODENAL ULCER

To establish the comparability of the groups treated by gastrectomy and vagotomy, we analyzed all of the cases with regard to certain factors that might bear upon the end result The patients treated by gastric resection were divided into two subgroupings depending upon whether or not they demonstrated retention of barium sulfate in the stomach after four or more hours, as shown by preoperative roentgenograms The results are listed in Table 1 It will be noted that these two subgroups treated by gastric resection are statistically comparable with regard to age spread, average and median age, race distribution, sex, type and duration of symptoms, and the surgeons performing the operations Furthermore, either of these groups is similar in these respects to the group treated by vagotomy, except that the average patient undergoing vagotomy is seven years younger and has had ulcer symptoms for two and one-half years less than has the patient treated by gastric resection If anything, these data would seem to favor the end results in the vagotomized group although, as will be indicated later, they do not

It is well recognized that better surgical end results will be encountered in the obstructed, rather than in the unobstructed, patient Is it fair, then, to include these obstructed patients in a group that is to be compared with patients treated by vagotomy for which any degree of gastric retention is here considered a contraindication? Despite the favorable weighing of the figures for gastric resection, which would result from the inclusion of this group we have eliminated entirely the patients with any degree of obstruction, in the interests of statistical comparability We have now reached the final stage of selection with 95 patients treated by gastric resection and 41 cases by vagotomy It is believed that these two groups are as nearly comparable as is reasonably possible in the study of clinical cases

In every case in both series, the following preoperative criteria had to and did obtain (1) symptoms of intractable pain, chronic bleeding or both, (2) failure to control symptoms by adequate medical regimen, (3) evidence of active ulcer by roentgen ray, (4) no retention, clinically or by roentgen ray At least one episode of preoperative bleeding was observed in 76% of the resection group and in 71% of the vagotomy group of patients

Operative Procedures—Gastric resections were of the conventional radical type with removal of an estimated two-thirds to three-fourths of the stomach in each case Closure of the duodenal stump and gastrojejunostomy were effected in all instances with interrupted nonabsorbable surgical (silk) sutures usually associated with preliminary hemostatic or inverting layers of chromic absorbable surgical suture The ulcer area was removed in all but 12 cases in which the surgeon felt constrained to leave the lesion behind because of its extent and location In these instances closure was effected either by simple inversion of the proximal duodenum or by use of the Bancroft modification of the Devine exclusion technique with removal of the mucosa of the pyloric remnant Anastomoses were of the Hofmeister type in 85 cases and of the Pólya type in 10 cases In 23 cases the anastomosis was retrocolic and in 72 cases antecolic

TABLE 1—*Comparison of Treated Groups*—Duodenal Ulcer*

Basis of Comparison	Gastric Resection: Duodenal Ulcer With Obstruction	Gastric Resection: Duodenal Ulcer Without Obstruction	Vagotomy Duodenal Ulcer Without Obstruction
Age

Type of symptoms	Pain and/or bleeding	Pain and/or bleeding	Pain and/or bleeding
Duration of symptoms—average	8.8 yr	8.3 yr	6 0 yr
Operation	Subtotal gastrectomy	Subtotal gastrectomy	Vagotomy

---

* All patients in these groups were men and the same group of surgeons operated on each of the treated groups of patients

Vagotomy was performed in each instance through the lower left transthoracic route with or without rib resection In each case the vagus nerve trunks were isolated and transected and a segment of nerve removed for histological verification Operations were performed by the full-time and attending surgeons until April, 1946, the date of establishment of the residency training program After that date 92% of the operative procedures were performed by the resident surgeons

Early Postoperative Results—Gastric Resection Following gastric resection suction with an indwelling Levin tube was maintained for two to four days in most instances followed by hourly feedings of 1 oz (30 cc) of liquid, which was increased to 2 and 3 oz (60 and 90 cc) hourly on successive days Semisolid foods were added on about the seventh day and gradually increased to an intermediate ulcer diet at the end of two weeks

There were three postoperative deaths, a case fatality rate of 3 2% The first of the patients who died developed early efferent loop obstruction necessitating lysis of adhesions on the eighth postoperative day He died on the 24th day after resection, of toxic hepatitis, with uremia, cholemia, and bronchopneumonia Autopsy showed toxic degeneration of the liver, spleen, kidneys, and adrenals There was no remaining evidence of obstruction of the intestinal loops

The second patient to die developed signs of peritonitis and died on the ninth postoperative day Autopsy revealed a 7-mm perforation of a duodenal ulcer left behind at operation, situated 1 cm distal to the stump closure There were acute diffuse peritonitis and focal acute pancreatitis

After discharge from the hospital four weeks after resection, the third patient was readmitted nine days later with abdominal pain and a palpable mass in the left lower quadrant Exploratory laparotomy revealed a retained laparotomy pad, two perforations in the jejunum, and markedly adherent intestinal loops that were freed The patient went downhill with paralytic ileus and uremia and died 111 days after resection Autopsy revealed multiple intestinal adhesions with obstruction and diffuse peritonitis

Including the postoperative deaths, 27 complications developed in 23 cases or 24% of the group The complications included 11 instances of atelectasis or pneumonia, four wound disruptions, three wound infections, two cases each of peritonitis, stump leakage and toxic hepatitis, and one instance each of efferent loop obstruction, splenic pedicle hemorrhage, and paraplegia[5] An undetermined number of patients estimated at about 20%, developed dumping syndromes of varying degrees of severity before discharge from the hospital The majority of these were transient and cleared spontaneously either before or shortly after discharge This problem will be discussed further under "Late Complications "

Vagotomy In all except two cases there was complete or nearly complete relief of ulcer pain immediately after operation Overnight gastric secretion studies and insulin (Hollander) tests were performed not only before surgery but on one or more occasions in the early postoperative period The results of these studies have been previously published in some detail[6] To summarize briefly, there was a decrease in the 12-hr overnight secretion volume to approximately one-fourth of the preoperative values In the 41 cases, postoperative insulin tests were negative in 33, indicating a presumptively complete nerve section In two cases the test was equivocal and in two cases the test was not performed because of severe atony In four cases the result was positive with the presumption of incomplete vagotomy In these four cases the end results were considered good in three and poor in one

Postoperative complications occurred in 24 or 59% of the group Most of these were pleural effusions that were of no serious consequence The most disturbing complication was the persistent gastric atony noted in the majority of cases and that was considered severe in four In these four cases, continued gastric suction and administration of bethanechol chloride (urecholine®) were of no avail, and further surgical intervention was required from three to 15 weeks after vagotomy Gastric resection was successfully performed in three cases In the fourth, because of severe debilitation from pre-existent hepatic disease, only gastroenterostomy was performed This failed to halt the patient's downhill course, and he died three months and 20 days following vagotomy This single postoperative death resulted in a case fatality rate in this group of 2 4%

Follow-Up Studies—Methods We have previously expressed our distrust of questionnaire responses, in particular when attempting to evaluate the extent of subjective symptoms We have repeatedly observed questionnaire replies that indicated a poor result when, after *a personal interview, it was quite obvious that the result* was good The converse of this situation has also been noted, although not with as great frequency The lesson that we have well learned is that questionnaire information may be grossly misleading and is easily influenced by slight changes in the wording of the questions Personal interview in conjunction with laboratory and roentgen-ray studies, when indicated, form, in our opinion, a method of evaluation least likely to result in interpretative error

For such reasons each patient was invited to return to the follow-up clinic or to be rehospitalized for more intensive study Table 2 indicates the type of follow-up study achieved in each group It is significant that over 98% of the determinate cases were followed and the vast majority of these by personal interview or, better still, by rehospitalization Although the follow-up periods are relatively short, they are comparable for each of the groups studied St John and his co-authors[10] have indicated that with gastric resection only a small percentage of additional failures will be observed after the three-year follow-up period This would seem to indicate that the present figures may not be significantly altered in the years to come

Late Complications—Before outlining the symptomatic end results, it would appear appropriate to discuss certain of the late complications of each operative procedure It is not possible completely to divorce these complications from end results, since in substantial measure they may influence the final evaluation Without attempting to consider every pathophysiologic alteration occasioned by either operation, we shall limit ourselves to the most commonly observed clinical situations namely, the dumping syndrome, recurrent ulceration, recurrent bleeding, and persistent severe atony

Dumping Syndrome Although this syndrome has been described in other conditions, it is most characteristic of the postsurgical state wherein the stomach has been anastomosed to the small intestine We have not tabulated the transient syndromes that were observed in the early postoperative period We have listed only those patients who, at least one year postoperatively, presented a symptom complex characterized by (*a*) weakness, nausea, vertigo, and/or headache, (*b*) occurrence of symptoms 10 min to several hours after eating, and (*c*) relief secured by recumbency Nine patients, or 10 2%, of the definitive group following gastric resection were considered to present the dumping syndrome by this definition Of these nine, three were considered severe, two moderate, and four were estimated as mild None of the vagotomized patients was observed to meet the criteria established

[6] Healy M J and Sauer P K Some Limitations of Vagotomy in the Treatment of Peptic Ulcer Ann Surg 130 985 1949

Ulceration Among the patients treated by gastric resection, five (5 6%) were observed to have roentgenologic and clinical evidence of a marginal gastrojejunal ulcer With a single exception, gastrointestinal roentgenograms were secured on all followed cases in which the result was other than good or excellent Virtually every patient, therefore, who presented any significant pain or bleeding had one or more gastrointestinal series in the follow-up period We have excluded from this category three patients with a history of bleeding without confirmatory evidence of ulceration after repeated roentgen-ray examinations Similarly, we have excluded two patients in whom roentgen findings of ulceration were suggestive but in whom clinical evidence did not support the diagnosis Of the five patients with marginal ulcer, one died of perforation with peritonitis six months after resection One patient was subjected to vagotomy nine months after resection, with only partial relief Three patients have persistent symptoms and have been classified as failures

Period of follow up observation mo	19-71	18-50
Average follow up period mo	33 0	36 2

When, at gastric resection, the duodenal ulcer is not removed, its subsequent activity cannot be determined by roentgenograms A different situation exists in the vagotomized group Here the ulcer is left behind in all instances and is available for roentgenologic appraisal Postoperative roentgenograms were taken one to five times during the follow-up period on each patient, with the exception of three, none of whom presented any ulcer symptoms These films were taken from seven months to three years after vagotomy and all were reviewed by two roentgenologists to avoid inequities in rating Details of the roentgenologic observations in this series have been previously reported [6] but are summarized here with the more recent follow-up reports Forty-six per cent demonstrated an active ulcer as evidenced by a niche or by deformity, irritability, spasm, and tenderness In another 46% inactivity was evidenced by cap deformity above In 8% follow-up roentgenograms were not available These findings would indicate that even after a suitable postoperative waiting period persistence or recurrence of active ulceration will be found as often as healing This observation is at considerable variance with reports from other clinics, which indicate a high rate of healing following vagotomy We believe that the technical methods observed in this series, together with the greater frequency of follow-up roentgenograms, have yielded a closer approximation to the true incidence of ulcer activity

Recurrent Bleeding In a consideration of only those cases which presented a history of preoperative bleeding it can be seen that the incidence of recurrence of this symptom in the follow-up period was 13 6% for the group treated by gastric resection and 31 0% for the vagotomized group This appears to confirm our observation of the low incidence of ulceration following gastric resection and the high rate of persistent ulceration after vagotomy

Severe Atony We have considered under this complication only those patients in whom the gastric atony following denervation was so severe that it constituted the main indication for further operative intervention Five patients met these criteria Gastroenterostomy was performed in two cases and gastric resection in three—from three weeks to 11 mo after vagotomy In addition, there were eight patients with moderate atony and 16 with slight atony Effects were rated on the basis of clinical symptoms of fullness, regurgitation, and vomiting These clinical observations showed a high degree of correlation with the roentgenologic findings of barium sulfate retention It is pointed out that these observations have been noted to persist up to three years after vagotomy The detailed roentgenographic findings in these cases are reported elsewhere [7]

End Results—Final evaluation of end results was based on the presence or absence of ulcer symptoms, the secondary effects of the operations, and the patient's estimate of his condition as compared with his preoperative status The following criteria were established for the adjective ratings assigned

End Result	Description
Excellent	No ulcer symptoms or secondary effects
Good	Mild or intermittent ulcer symptoms or secondary effects, but definite improvement shown
Fair	Recurrence of ulcer symptoms or marked secondary effects, or both but condition better than preoperative state
Failure	Return of ulcer symptoms to preoperative level or worse, secondary complications necessitating further surgery, or both

Results are summarized in Table 3 Of the 12 failures in the postgastrectomy group, the three postoperative deaths have already been discussed There were five patients who developed symptomatic stomal ulcers, one of whom died from perforation six months after resection Two patients developed severe dumping syndromes and two had recurrences of ulcer symptoms

Of the 14 failures after vagotomy, four patients required further surgery because of persistent severe atony three weeks to three and one-half months after nerve section There were recurrences of ulcer symptoms in the remaining 10, seven of whom had gastric resection performed from three weeks to 42 mo after vagotomy Altogether, of these 14 cases, 11 underwent subsequent gastroenterostomy or gastric resection, and three of these died postoperatively Despite the antecedent vagotomy, marginal ulcers later developed in three patients, in two after gastric resection and in one after gastroenterostomy

---

[7] Priviteri C. Gastrointestinal Roentgenographic Observations in Peptic Ulcer Patients Treated by Vagotomy Am. J Roentgenol 65 561 1951

These observations indicate a clear-cut superiority of gastric resection over vagotomy in a selected group of patients with duodenal ulcer As previously noted, we have not included those patients having duodenal ulcer with any degree of gastric retention In other reported series such patients are customarily included If we were to add these, the percentage of patients improved after gastric resection would be increased from 87 0% to 90 8%

DUODENAL ULCER WITH OBSTRUCTION

We will briefly consider the end results of subtotal gastrectomy for obstructed duodenal ulcer of which there were 71 cases in this series The characteristics of this group have been noted in Table 1 There was one postoperative death (pulmonary embolus) for a case fatality rate of 1 4% Follow-up observations were made in 100% of the cases from 12 to 71 mo postoperatively, an average of 34 mo Rehospitalization or clinic visits were obtained among all but three patients from whom questionnaire responses were obtained A moderate dumping syndrome was noted in one patient (1 4%), and stomal ulcers in three (4 3%) Of 26 patients with preoperative bleeding, only two noted this symptom in the follow-up period End results were excellent in 39, good in 27, fair in 2, a total of 68 patients, or 95 7%, improved Symptomatic failures were noted in two instances, a finding which, together with the single postoperative death, accounted for 4 3% of the failures in the group It is readily noted that the results in this group are substantially better than in that of the nonobstructed ulcer cases

Postoperative deaths	3	3.3	1	2 4
Total failures	12	13 1	14	34.1

* Percentages are based on definitive cases in which the end result could be established

GASTRIC ULCER

We have not used vagotomy in cases of gastric ulcer because of the risk of leaving behind a cancer Gastric resection has been recommended in all patients with gastric ulcer who have not promptly and completely responded after a strict medical regimen of not longer than two months Since we cannot, in this group, compare vagotomy with gastric resection, we shall only briefly outline our results with the latter procedure

There were 32 cases in which the diagnosis of benign gastric ulcer was confirmed by histological examination Patients were all men, with ages ranging from 31 to 65 yr, the mean age was 51 yr Thirty-one were white and one Negro Duration of symptoms varied from one month to 40 yr, the average was 7 7 years Symptoms were pain alone in 22, bleeding alone in one, and both pain and bleeding in nine cases There were no postoperative deaths All patients but one have been followed from six to 47 mo Of the group followed, personal interview or rehospitalization was achieved with all patients but one, from whom satisfactory questionnaire information was received There was no development of persistent dumping syndromes or marginal ulcers in any of the patients during the period of observation to date Twenty patients had excellent results, eight were rated as good, two as fair, and only one as a failure This makes a total of 97% of the group benefited by resection

Gastric resection was performed in one instance of a radiation gastric ulcer following 1,000,000-v radiation therapy for metastatic carcinoma of the testicle The surgical result was good after 22 mo, but the patient was dying of metastases

Subtotal gastrectomy was performed in four cases of chronic hypertrophic gastritis in each of which there was preoperative suspicion of cancer There was one postoperative death from evisceration, peritonitis, and efferent loop obstruction The remaining three patients have been followed from 23 to 39 mo with good results in two, and fair in one

Gastric resection was performed incident to a block resection of the stomach, jejunum and colon in two cases of gastrojejunocolic fistula One patient died from a recurrence of his fistula and intestinal obstruction after 29 mo The other patient had a good result after 20 mo

MARGINAL ULCER

In the marginal ulcer group there were nine patients treated by gastric resection and 11 by vagotomy Characteristics of the two groups are listed in Table 4 In either group the indications for operation were basically the same, namely, ulcer pain with or without bleeding, failure to respond to a hospital medical regimen, and the roentgenologic demonstration of an ulcer crater at or near the gastrojejunal stoma Although the great majority of the vagotomized group showed early good results, further follow-up showed additional failures, three of whom required further definitive surgery during the follow-up period All of the gastric resections were performed for marginal ulcers following previous gastroenterostomies However, only four of the vagotomized group had this background, the remainder having developed marginal ulceration following previous gastric resection In the former group there were two failures, and two improved, in the latter group there were three failures, and four improved

Although comparable in most respects, these two groups are too small for the derivation of precise conclusions However, it is reasonably apparent that vagotomy does not possess any special advantage insofar as end results are concerned

COMMENT

There are undoubtedly many unsatisfactory aspects of both surgical procedures Technical difficulties are present in the performance of either vagotomy or gastric resection, and each carries a significant mortality and a high incidence of undesirable sequelae The frequency and extent of these side effects will vary with many factors, including the selection of cases, surgical technique, the length and frequency of follow-up examination, and the criteria utilized to judge the results We have attempted to establish more precisely the relative advantages and disadvantages of vagotomy and gastric resection by comparing observations in a carefully controlled series in which many variables have been minimized or eliminated

In gastric resection the importance of removing adherent ulcers distal to the first portion of the duodenum has been emphasized by Lewisohn [8] and Hinton [1b] On the other hand, Wangensteen,[9] Colp [10] and Rienhoff [1e] have stated that if adequate resection is performed, such ulcers could be retained without influencing the end results In our series, out of 75 cases in which it was determined that the ulcer was removed, the number of failures was eight (10 7%), whereas in 12 cases in which the ulcer was left behind the number of failures was three (25%) The statistical significance of this difference in end results is open to question because of the small number of cases involved At any rate, factors other than a retained ulcer are at play, which might account for the reported poor results in this type of case

TABLE 4 —*Analysis and End Results in Cases* of Marginal Ulcer*

	Gastric Resection	Vagotomy
Number of cases	9	11
Age deviant	43-65 yr	28-57 yr
Age mean	52 yr	45 yr
Race ratio of white to Negro patients	9/0	11/0
Duration of symptoms mean	6 yr	7 yr
Follow-up percentage	100%	100%
Duration of follow up	12 58 mo	12-42 mo
Average follow up	33 mo	27 mo
Results		
Excellent	3	0
Good	3	4
Fair	1	2
Total improved	7 (78%)	6 (55%)
Failure	1	5
Postoperative death	1	0
Total failure	2 (22%)	5 (45%)

* Patients in both groups were all men

The cases of gastric resection were analyzed to determine if certain other variable factors influenced the end results, and none were found The performance of either a Hofmeister or Pólya type of anastomosis—or its placement in front of or behind the colon—did not significantly influence the final results in this series

SUMMARY AND CONCLUSIONS

A critical analysis of the two most commonly utilized forms of surgical treatment of peptic ulcer, namely, subtotal gastrectomy and vagotomy, is presented The study is based on 263 consecutive gastrectomies and 54 consecutive vagotomies concurrently performed at the U S Veterans Hospital, Bronx, N Y , during the four-year period 1945-1948 From the cases of duodenal ulcer, two groups were selected that were comparable in all significant variables except in the definitive surgery employed To evaluate the effect of nerve section on the ulcer process, vagotomy was not combined with gastroenterostomy or other procedures that might have obscured the issue

The value of the study is enhanced by a very high rate of follow-up—100% in the vagotomy group and 98% in the gastric resection group Follow-up intervals varied from 12 to 71 mo , with an average of 34 mo Only 5 5% of follow-ups were by questionnaire, the remaining patients being personally interviewed and, in almost 50% of the cases, being briefly hospitalized so that more exact laboratory and roentgenologic evaluations might be obtained

The case-fatality rate after vagotomy was 2 4%, after gastric resection, 3 2% Early postoperative complications were of the same order of frequency, but those following gastric resection were considered of more serious consequence Undesirable late complications, on the other hand, were significantly higher in the vagotomized group

In the comparable groups of patients with nonobstructing duodenal ulcer treated by gastric resection and vagotomy, the following significant observations were made

1 Gastric resection was followed by dumping syndromes of varying degrees of severity in 10 2% of the cases Vagotomy had gastric atony as its most frequent sequel, this occurring to a significant degree in 46 3% of the cases and being severe enough to make further definitive surgery mandatory in 19 5% of all vagotomies

2 Marginal ulcers could be demonstrated in 5 8% of the resected group Recurrent or persistent active ulceration was observed in 36 7% of the vagotomized patients

3 Among patients with a preoperative history of bleeding, recurrence of this symptom, to a varying degree, was noted in 13 6% of the resected patients and in 31 0% of the vagotomized group

4 Over-all final evaluation showed 87% of the patients improved and 13% regarded as failures after gastric resection, and 65 9% improved and 34 1%, failures after vagotomy

When the entire gastric resection group—with obstructing as well as nonobstructing ulcers—is compared with the vagotomy group, the balance is even more in favor of resection, 90 8% of the patients improved and 9 2% classified as failures

A comparative analysis of small groups of anastomatic (gastrojejunal) ulcers treated by gastric resection (nine) and by vagotomy (11) showed the following results After gastric resection improvement was observed in 78% and failure in 22% of the cases After vagotomy, improvement was obtained in only 55%, and there was failure in 45%

From these studies it appears that gastric resection can be expected to produce significantly superior results in the elective surgical treatment of intractable duodenal ulcer

ANATOMIC STUDY OF BENIGN AND MALIGNANT GASTRIC ULCERATIONS

R P Boudreau, M D , Philadelphia, J P Harvey Jr , M D , Cleveland
and
S L Robbins, M D , Boston

The differentiation, on purely clinical grounds, of a benign from a malignant gastric ulcer, while one of the most commonplace problems in medicine, is one of the most perplexing Most criteria of supposed value have been proved to be extremely fallible [1] It has been stated by Allen and Welch [2] that at best there is a 35% error in the diagnosis of gastric lesions The diversity of opinion (brought to light in a panel discussion) among a group of experts as to the relative value of the various diagnostic criteria clearly demonstrates the cause of much of the confusion in this problem [3] And while it is freely admitted that in any given case of a gastric ulcerating lesion there may be disagreement over the diagnosis, *agreement, at least, should be reached over the diagnostic* significance of the various clinical findings

The size of the crater and its location in the stomach are the two features that have been given the greatest importance in the differential diagnosis of benign and malignant lesions Since the writings of Alvarez and MacCarty [4] in 1928, ulcer craters of more than 4 cm in diameter have been considered to be virtually always malignant Similarly, prepyloric locations and positions along the greater curvature are widely considered to indicate malignancy Yet the participants in the panel discussion to which previous reference was made failed to agree on these important points

Patently, it should be possible by sufficient anatomic study to put such criteria to the test It is the purpose of this report to present such a study, directed at evaluating the validity of some of the established criteria It is hoped that with sufficient data the relative values of the various clinical findings can be established and given their proper weight in any diagnostic consideration,

MATERIAL AND METHODS

The study includes all patients with benign or malignant gastric ulceration who were examined postmortem at the Mallory Institute of Pathology of the Boston City Hospital from 1940 to 1949 Only those lesions forming discrete excavated craters have been included, All fungating or scirrhous carcinomas of the stomach, with or without ulcerations, have been discarded These latter types of lesions are for the most part readily diagnosed both *roentgenologically and gastroscopically* and are not usually confused with benign peptic ulcerations The study has further been limited to patients 50 yr of age or over because it is in this age group that differential diagnosis is most difficult There were 8,493 autopsies performed at the Mallory Institute of Pathology during the period under study Of these, there was a total of 234 cases of gastric ulceration suitable for inclusion in this report. One hundred sixty-eight patients had benign and 66 had malignant ulcerating lesions Each case was studied as to the sex and age of the patient, the size and site of the ulcer, and the cause of death These features will be discussed separately

Table 1 —*Age Distribution of 234 Cases of Gastric Ulceration*

Age Group	Total	Benign		Malignant	
		No	%	No	%
50-59 yr	48	40	83.3	8	16.7
60-69 yr	80	52	65	28	35
70-79 yr	81	58	71 6	23	28.4
80 yr and over	25	18	72	7	28

Age —The age of the patient has always been considered to have some differential diagnostic value In a general way, benign peptic ulceration has been considered to be a disease of the younger person, while its malignant counterpart is supposed to occur more frequently in the older person Accordingly, it was of interest to analyze the age distribution of the current series of ulcers under study The findings are presented in Table 1

In considering the above distribution it is well to remember that these figures represent a consecutive series of ulcers found in postmortem studies in a laboratory of a large municipal hospital They do not include surgical material or agonal ulcerations that often develop during the last days of life As such, the relative frequencies of benign and malignant ulcerations are subject to the modifying influence that surgical removal more frequently occurs in gastric cancer than in benign ulcerations. It is *likely, therefore,* that the relative numbers of benign and malignant ulcers in this series will be weighed in favor of the benign lesions In the present series the number of malignant ulcers rises from eight in the sixth decade to 28 and 23, respectively, in the seventh and eighth decades Similarly, the incidence of benign ulceration shows a rise with advancing age, the numbers being 40, 52 and 58 in the sixth to the eighth decades Some of this apparent rise in incidence is due to the fact that the age distribution of patients examined postmortem shows a considerably larger number of cases in the seventh and eighth decades as compared with the sixth

If the incidence of ulcerations is corrected for the number of autopsies *performed* in each age decade, then malignant ulcers show a slight increase in frequency with advancing age and the benign lesions tend to remain at a constant level of frequency These figures are only of significance insofar as they demonstrate that benign lesions do not decrease in the later years of life and are by no means uncommon in the aged [5]

Table 2 —*Analysis of the Size of 190 Benign and 68 Malignant Gastric Lesions*

Size	Benign Ulcers		Malignant Ulcers

Sex—Male predominance in the ratio of 2 5 to 1 in this series, in both benign and malignant ulcerations of the stomach, is a well-established fact

Size—The most widely emphasized differential criterion between benign and malignant ulcers is the size of the crater Table 2 presents an analysis of the size of 190 benign and 68 malignant lesions in the stomach

It is apparent that most benign ulcers are small, approximately two-thirds (67%) being less than 2 cm in diameter By contrast, only 14 malignant ulcers, 20 6% of the series of 68, were less than 2 cm in diameter However, it is not the relative incidence that is important, but the fact that malignant ulcers may be small or contrariwise, not all small ulcers are benign Considerable emphasis has been placed on the differential importance of the 4 cm crater[4] We found that approximately 50% of malignant ulcerations were less than 4 cm , and at the same time 10 5% of the benign ulcers were more than 4 cm These figures are in striking contrast to those of Alvarez and MacCarty, who found that in surgically removed specimens all benign ulcers were less than 4 cm and only 23 2% of carcinomas were less than 4 cm

Analyzed from still another viewpoint, in this series, 84% of all ulcers less than 4 cm were benign and 16% were malignant When the group of lesions more than 4 cm in diameter is considered, it is seen that 62% are malignant and 38% are benign These latter figures, however, must be subject to the correction that malignant ulcers of this size are more apt to be surgically excised than their benign counterparts and thus would not be included in this analysis It is concluded that the size of the ulcer crater has only a limited value as a differential diagnostic point The largest benign ulcer in this series measured 12 by 8 cm Conversely, the many malignancies found as small craters less than 2 cm in diameter were not merely incidental findings Many were clinically diagnosed and some caused death of the patient.

TABLE 3—*Analysis of the Site of Gastric Ulcerations*

	Prepyloric	Body	Cardia	Greater Curve	Lesser Curve	Anterior Wall	Posterior Wall
Benign	87 (58%)	52 (35%)	11 (7%)	24 (14%)	78 (47%)	21 (13%)	44 (26%)
Malignant	34 (56%)	19 (31%)	8 (13%)	23 (27%)	33 (39%)	10 (12%)	19 (22%)
Total no ulcers	121	71	19	47	111	31	63

Site—It is difficult to describe the exact localization of a lesion in a complex three dimensional organ such as the stomach For purposes of our study, however, they were considered under two classifications The first divided the stomach into three anatomic subdivisions the cardia, the body and the prepyloric region, which has been arbitrarily designated as the portion 3 cm proximal to the pyloric ring The second classification of sites considered the lesions in respect to their positions along either the curvatures of the stomach or the anterior and posterior walls Many craters were found overriding some of these artificial boundaries, and were considered in both categories, making an apparent increase in the total number of lesions studied Since the descriptions were not sufficiently detailed on occasion to permit accurate placement of the lesion, the total number of ulcers in the two tables may not necessarily be identical The distribution is presented in Table 3

Table 3 graphically illustrates that there is no area of the stomach immune to malignancy The areas of greatest predisposition to ulceration appear to be the prepyloric region Of the series of benign ulcers, more than half (58%) occurred in the prepyloric region, and almost the exact proportion of malignancies (56%) occurred in this same region

In the benign ulcer group most occurred on the lesser curvature, 47% as contrasted with 14% along the greater curvature For the malignant group it is of great interest that a high proportion of these cancers occurred along the lesser curvature (39%) and only 27% were placed on the greater curvature These observations contradict many previous clinical concepts and are at variance with those reported by Allen and Welch[2] These authors reported lesions on the greater curve as being virtually 100% malignant, and prepyloric 65% malignant However, their figures were obtained from surgically resected stomachs whereas our cases were obtained from autopsy specimens

Hemorrhage and Perforation—Two of the important complications of gastric ulceration are hemorrhage and perforation Bleeding probably occurs at some time in most ulcerating gastric lesions However, in this report only severe bleeding as evidenced by signs of gross blood found in the gastrointestinal tract at autopsy were included in this category It will be shown that hemorrhage is a frequent cause of death In cases where hemorrhage was not the chief cause of death it was a contributing factor

It is shown in Table 4 that perforation occurred almost as frequently in benign ulcerations (18%) as in malignant ones (12%) Significant hemorrhage, however, was commoner in benign peptic ulcers (37%) than in cancerous ulcers (27%) The hemorrhage tends to be more severe in benign ulceration often causing death These figures essentially agree with those of Portis and Jaffe,[6] who reported that hemorrhage had occurred in 22 (18%) of 120 post-mortem examinations of patients with gastric ulcers, and perforation had occurred in 24, or 20%

DIAGNOSIS

The difficulty of diagnosing gastric ulcerations in large municipal hospitals is borne out by the analysis of the clinical diagnoses in this series of cases (Table 5)

The correct diagnosis of gastric ulceration, benign or malignant, was infrequent in our series Only cases in which the diagnosis had been firmly established by the service are listed as correct diagnoses In many instances termed "not diagnosed and symptomatic lesions," the diagnosis was suspected but not clearly established In these cases there may have been ulcer symptoms in the past history, or the patient may have entered the hospital because of some other problem and was in the process of being worked-up when death occurred

The incidental group was made up of cases without any findings in the available history leading to a suspicion of gastric ulceration Perhaps a more careful history might have disclosed many more of these The nature of this hospital, a municipal institution to which are brought many emergency cases, accounts for the high percentage of acutely ill patients who are brought in with little previous history available, and no time for diagnostic evaluation These patients often die within hours of admission to the hospital, during which time all efforts have been focused on the therapy of the acute symptoms

TABLE 4—*Distribution of Hemorrhage and Perforation in Gastric Ulceration*

	Benign Ulcers (168)		Malignant Ulcers (66)	
	No	%	No	%

Perforation	31	18	8	12

The malignant ulcerating lesions were divided according to the same criteria In the malignant group the *num-*

---

[6] Portis J A and Jaffe R H Study of Peptic Ulcer Based on Necropsy Records J A M A 110 6-13 (Jan 1) 1938

ber of correct diagnoses established was somewhat better than in the benign group Perhaps the better record in the cancer cases is possible because of the number of patients entering with masses in the abdomen, obviously malignant, with gastric symptoms indicating the stomach as the primary site Although some were suspected, still a large percentage (45%) were not definitely diagnosed

Although our figures are weighed against the clinical service insofar as suspicion of gastric ulceration was not accepted as a diagnosis, in a study of this type they indicate the difficulties inherent in the establishment of a definite diagnosis

CAUSE OF DEATH

Table 6 presents a comparative study of causes of death in the two types of ulcer lesion The complications of benign gastric ulcerations, hemorrhage and perforation, were a very significant cause of death (43%) in this group of patients Hemorrhage was the leading cause of death (26%) Peritonitis secondary to perforation was the third most frequent cause of death (17%), cardiac difficulty was the second (20%) The other causes of death were mostly concomitant or intercurrent unrelated diseases No particular disease entity was found which showed any apparent relationship to ulcerating gastric lesions The high incidence of complications directly attributable to benign ulceration, namely hemorrhage or perforation, is noteworthy This becomes of greater importance when it is realized that some of these lesions included in this series were merely incidental Moreover, since more than 8,000 autopsies were screened for gastric lesions, it cannot be said that these proportions are weighted by an unusual number of severe lesions The significance of these findings is obvious in the older age group Therapy of benign ulceration must take into consideration the high risk of serious, frequently fatal, complications

TABLE 5—*Analysis of Clinical Diagnoses in Gastric Ulceration*

Diagnosis	Benign No	Benign %	Malignant No	Malignant %
Diagnosed and symptomatic	19	11	25	38
Not diagnosed and symptomatic	19	11	6	9
Not diagnosed and asymptomatic (incidental)	75	45	5	8
Died within 48 hours of entering hospital	55	33	30	45

In the malignant group, 54% of the patients died with extensive metastatic spread of their gastric cancer Hemorrhage (12%) and perforation (9%) were relatively less significant in the malignant group than in the benign. It must be remembered that the patients in the malignant group are exposed to a specific risk, namely metastatic spread, to which the benign group is not exposed Nevertheless, since patients with a metastatic gastric malignancy may still die of hemorrhage, it is justifiable to compare the 26% rate of fatal hemorrhage in benign ulcerations with the 12% rate in malignant ulcers Further, the 17% rate of peritonitis in benign ulcers due to perforation is considerably higher than the 9% rate in the cancer group Thus, hemorrhage and perforation constitute criteria of differential significance in the diagnosis of bleeding and perforated gastric lesions

SUMMARY AND CONCLUSIONS

From the preceding anatomic analysis it is possible to draw certain conclusions relative to the fallibility of some of the old "time-tested" criteria With reference to age it is indicated that gastric ulcers occurring in patients over 50 yr of age cannot be assumed to be malignant While this study of autopsy material does not permit an accurate estimate of the relative incidence of benign and malignant ulceration, it does make apparent the fact that benign ulceration is by no means uncommon in the three decades over 50 The number of both benign and malignant ulcers steadily mounted through these three decades This increase merely reflects in part the greater numbers of post-mortem examinations performed in these age groups When the data was corrected for the number of autopsies performed in each decade, benign ulcers were found to occur in approximately the same ratio through the three decades, while malignant ulcers showed a slight but progressive rise in incidence It is important to note that even in the eighth decade the incidence of benign ulceration is high

TABLE 6—*Comparative Study of Causes of Death in Ulcer Lesions*

* Autopsy restricted no cause of death found

The concept that the size of the ulcer crater has an important bearing on its malignancy has been shown to be quite unreliable Approximately one-tenth of all the benign ulcers were more than 4 cm in diameter, and 38% of the total mixed group of benign and malignant ulcers more than 4 cm in size were benign This percentage distribution is undoubtedly high because of the exclusion of surgical material Therefore, the size of the crater can have only limited differential diagnostic value

The ulcer site in this series was shown to be of little differential value Carcinomatous ulcers were found in all areas of the stomach, and in numbers sufficient to warrant confusion with benign ulcers in the same areas In the present study, two-thirds of the lesions in the prepyloric area were benign On the greater curve 51% of the lesions were benign On the lesser curve 29% of the lesions were malignant The relative proportions of these lesions is of considerably less importance than the fact that benign and malignant lesions were intermingled in all areas of the stomach These results are at definite variance with some previous clinical concepts

Hemorrhage and perforation with peritonitis were found to be of great clinical significance in ulcerating lesions, being the first and third most frequent causes of death in benign gastric ulcerations Together these causes are responsible for 43% of the deaths in the benign group Hemorrhage and peritonitis also occurred as causes of death in cases of carcinomatous ulcers However, in this group, 54% of the patients died from extensions of their cancerous lesions Moreover, as differential points, hemorrhage and perforation are much commoner in benign lesions than in the malignant.

This study serves to reemphasize the fallibility of absolute dependence on any clinical feature in the differential diagnosis of benign and malignant gastric ulcers The proper diagnosis, when possible, can be arrived at only by the use of many clinical findings, each of which is of uncertain significance but whose combined value may permit a reasonably accurate decision

DRUG FATALITIES

Nathan Flaxman, M D , Chicago

There have been 107 drug fatalities reported in the literature since December, 1946 These deaths were not from poisonings of the accidental or suicidal type but occurred in the use of regularly advised and prescribed drugs Isolated case reports have emphasized this fact These deaths resulted not only from drugs given orally and parenterally, but also from certain ones used in diagnostic procedures

Dragstedt considered the course of events attending the advent of a new drug It is synthesized by the chemists, it undergoes various screening tests as to its actions and effects by the pharmacologists, its toxicity is surveyed in laboratory animals, it is distributed for controlled clinical investigation, it shows some therapeutic merit, it is released for general therapeutic trial, and then, usually within three or four months, reports describing its unexpected and untoward actions begin to appear Smith discussed all aspects of safeguards in the use of new drugs and expressed the belief that the question, "Does the toxicity outweigh the therapeutic advantages, keeping in mind the seriousness of the conditions for which it is being offered?" is the deciding factor However, as the present analysis shows, not all reactions are due to new drugs

ORAL MEDICATIONS

Bishydroxycoumarin U S P (Dicumarol®) —This was the commonest cause of fatalities resulting from drugs given orally Eleven fatal hemorrhages were reported, bringing the total number of recorded deaths to 32 Even with careful laboratory control over a long period, and despite long prior use without serious complications, these fatalities occurred Link, the synthesist of this drug, commented that the briefest meditation on the strictly theoretical aspects of the clotting phenomena leaves one with the appalling feeling that tampering with coagulability of blood is a hazardous business A considerable number of nonfatal reactions have occurred, and these, along with those due to other drugs, will be discussed separately

Antiepileptic Drugs —Abbott and Schwab reported that the newer anticonvulsant drugs produce moderately severe, but reversible, side reactions in about 35% of patients and dangerous toxic ones in 1 to 2% Methylphenylethylhydantoin (mesantoin®) caused three fatalities—two due to pancytopenia and one to a fulminating bullous dermatitis Trimethadione (tridione®) was blamed for a fatal pancytopenia, two other instances having been reported in 1946 Phenacemide (phenurone®) was considered the probable cause of a hepatorenal syndrome and an aplastic anemia Such severe depression of the bone marrow generally results from prolonged use of the antiepileptic drug Blood examinations should not be omitted at any time while the drug is being used or for a period after it has been discontinued Bromides, phenylhydantoin (dilantin®), mephobarbital (mebaral®), and phenobarbital are safe drugs in the treatment of epilepsy

Lithium Chloride —Three known fatalities resulted from the use of this drug as a substitute for sodium chloride in the diet The lithium preparations were immediately withdrawn from the market

Sulfonamides —Fatalities from the sulfonamides continue to occur A fatal reaction to phthalylsulfathiazole U S P (sulfathalidine®) in the treatment of subacute nonspecific ulcerative colitis (one case) and fatalities due to sulfadiazine nephrosis (one case), and sulfathiazole anuria (two cases) were reported.

Antithyroid Drugs —Thiouracil caused two fatalities, one due to acute yellow atrophy and the other to agranulocytosis Although no known deaths have occurred from use of the other antithyroid drugs, both propylthiouracil and methylthiouracil have caused difficulties

Acetylsalicylic Acid —This drug was cited as the cause of two deaths—one from the ingestion of 2 56 gm in a period of 14 hours by an infant, and one from the ingestion of 5 to 6 1 gm (15 to 20 tablets, 5 grains [0 325 gm] each) in a period of three hours by a man The reported cases of poisoning by this drug were evaluated, and only a few fatal instances were found in which the administration was reliably observed by a physician and the exact dose known

Other Drugs —Fatalities due to the thiocyanates, ertron® (a concentrated vitamin-D preparation), cinchophen, tetraethylthiuram disulfide (antabuse®), and pyrithylidine (presidon®) occurred The last-named drug, pyrithylidine, was immediately withdrawn from the market and all use of it discontinued by the pharmaceutical manufacturer This, unfortunately, cannot be said of the others cited, although some of them, such as the

---

Associate in Medicine, Chicago Medical School Consulting Physician Manor Hospital thiocyanates and cinchophen, have a long record of repeated severe toxic effects and fatalities. The value of these two drugs in the treatment of essential hypertension and arthritis, respectively, is decidedly questionable, while the dangers inherent in their use are very great.

PARENTERAL MEDICATIONS

Antibiotics.—Here a paradoxical situation of importance exists. There is no question of the value of the antibiotics, yet 11 fatalities, six due to penicillin and five to streptomycin, were reported. Penicillin deaths were due to exfoliative dermatitis, Jarisch-Herxheimer reactions in syphilitic patients, and anaphylaxis. Streptomycin caused fatal toxic encephalopathy and dermatitis with stomatitis. The neurotropic effects of streptomycin are particularly likely to manifest themselves in patients with renal or hepatic insufficiency.

Curare.—Curarization, both in anesthesia and before electroshock therapy, resulted in nine fatalities due to respiratory arrest. The amount of the drug used and the time of onset after injection varied. Bilateral pulmonary collapse without evidence of tracheobronchial obstruction followed within three minutes the injection of 60 units of purified *Chondodendron tomentosum* extract (intocostrin®) while an anesthetic was being administered. In another instance 100 units of *d*-tubocurarine chloride was given to permit bronchoscopy, and the patient died as a result of respiratory arrest in 165 minutes.

Mercurial Diuretics.—Cases of sudden death due to these drugs and of fatal mercurialism continue to be reported. Wallner and Herman cited the case of a 50-year-old man with hypertensive cardiovascular disease who was admitted because of pulmonary and peripheral edema and received 2 cc. of meralluride ("mercuhydrin") intramuscularly daily. On the ninth and 10th days the patient had a temperature of 101 and 102 F. after the injections and complained of retrobulbar pain. The diuretic was stopped, and the temperature returned to normal. On the 18th day 2 cc. of meralluride was again given intramuscularly; within 30 minutes the patient went into shock and died five hours after the injection. Apparently, the intramuscular route does not safeguard against unfavorable reactions. The authors condemned the routine use of daily parenteral injections of 2 cc. of a mercurial diuretic. Fatal mercurialism due to the prolonged intravenous administration of mercurophylline injection U. S. P. ("mercupurin") in doses ranging up to 4 cc., given twice weekly to control the edema of a young man who had diabetes with the Kimmelstiel-Wilson syndrome, was also reported.

Neoarsphenamine.—Cases of poisoning due to this drug also continue to be reported. Two cases of arsenical encephalopathy occurred, in both of which penicillin had first been given. Medical shock and death followed use of this arsenical for syphilis in a case of chronic alcoholism.

Aminophylline.—Three fatal reactions followed intravenous administration of aminophylline U. S. P. Two were in patients who had suffered an acute coronary thrombosis, both died during the intravenous injections of the 7½-grain (0.5-gm.) solutions.

"Analbis" Suppositories.—Early in 1947 a number of deaths were attributed to a bismuth compound in the "analbis" suppositories; three cases were reported in detail. All the deaths occurred in children who had been treated with the drug, a bismuth salt of heptatodiene carboxylic acid (diallylacetic acid) for infections of the upper respiratory tract. The suppositories were promptly removed from the market.

Other Parenteral Drugs.—Fatalities occurred from use of tetraethylammonium chloride (etamon® chloride) and tetraethylammonium bromide, anaphylactic shock from a protein digest (amigen®), and an allergic reaction due to the influenza-virus vaccine. Deaths due to the use of emetine hydrochloride in the conditioned-reflex treatment of chronic alcoholism and to the phenol in foille® emulsion in the treatment of burns were also reported.

DIAGNOSTIC PROCEDURES

Angiocardiography.—Twenty-six fatalities occurred in a total of 6,824 examinations reported. Seventeen of the 26 deaths were of children under 8 years of age, all with congenital heart disease. The commonest cause of death was a sudden respiratory arrest immediately or shortly after injection of the contrast substance.

Cholecystography.—Myocardial infarction resulting in three deaths followed the administration of vasopressin injection U. S. P. (pitressin®) for cholecystography. Vasopressin is a powerful vasoconstrictor, particularly of the coronary arteries, and as a diagnostic aid it should be employed with the utmost discretion.

Pyelography.—One sudden death followed the intravenous administration of iodopyracet injection U. S. P. (diodrast®), thought to be of allergic origin.

Myasthenia Gravis.—A fatality was reported to follow the diagnostic test with neostigmine for this disease.

Allergy Tests.—Sudden death due to an anaphylactic reaction to intradermal tests in a 25-year-old woman with asthma and hay fever, and previously desensitized over a period of 13 years, led Harris and Shure to advocate that scratch tests be done first.

SUMMARY AND CONCLUSIONS

Since December, 1946, a total of 107 drug fatalities have been reported in the literature. Oral medications, parenterally administered drugs, and drugs used in diagnostic procedures were equally responsible.

Among the oral medications bishydroxycoumarin U. S. P. (dicumarol®) caused 11 fatal hemorrhages. Two of these were on an outpatient basis, and no laboratory studies were performed. Regardless of the short- or long-term use of this anticoagulant, and despite adequate laboratory control, nine other fatalities occurred. It has been recommended that during treatment with bishydroxycoumarin U. S. P. lumbar sympathetic blocks should not be performed, as fatal retroperitoneal hemorrhages have resulted.

Anticonvulsant therapy with methylphenylethylhydantoin (mesantoin®), trimethadione (tridione®), and phenacemide (phenurone®) resulted in six fatalities

It has been recommended that examinations of the blood be continued not only during the entire period of use, but also for a reasonable period after the drug is stopped, to detect any depression of the bone marrow

Certain drugs, such as lithium chloride and pyrithyldine (presidon®), were immediately withdrawn from the market A similar procedure is recommended for the thiocyanates and cinchophen, two old offenders responsible for many previous serious reactions Tetraethylthiuramdisulfide (antabuse®), as a treatment for alcoholism, requires careful consideration before it is released for use, some time in 1951, not after Any of the sulfonamides and the thiouracil preparation call for continued caution in their administration

Among the parenteral medications, the antibiotics caused the largest number of deaths Certain precautions should not be overlooked in their use A history of allergy, of previous sensitization to the antibiotic, the appearance of a rash, or the presence of cardiovascular or neurological syphilis calls for great caution in the administration of penicillin Renal or hepatic insufficiency is a probable contraindication to the use of streptomycin In the use of curare, either in anesthesia or before electroshock therapy, a definite hazard exists, and death may result from respiratory arrest Continued reports of fatalities due to intravenous and intramuscular administration of mercurial diuretics and to the use of neoarsphenamine call for thought in administering them Intravenous injection of aminophylline in the treatment of acute coronary thrombosis is not advisable

Of the diagnostic procedures, angiocardiography carries the greatest risk in cases of congenital heart disease The utmost caution is advised in the use of vasopressin injection U S P (pitressin®) in the course of routine cholecystography, as myocardial infarction and sudden death may follow its administration It must also be borne in mind that sudden death has followed the intravenous administration of iodopyracet (diodrast®) in pyelography, neostigmine as a diagnostic test for myasthenia gravis, and intradermal tests for allergic states

30 N Michigan Ave

Resistance to Cancer—Although there are many indications that the body does possess a resistance to the growth and to the implantation of secondary deposits this is a field of work that has been neglected We speak of a selective affinity in growth, e g., the liability of carcinoma of the lung to spread to the adrenals In such blood spread there is equal access to many other organs but the growth of the deposit is resisted in other situations It has been demonstrated that the spleen may receive malignant cells in fair numbers and destroy them before they can multiply to give rise to a visible secondary deposit it is better to regard the curious distribution of secondary deposits as determined by relative resistance rather than relative susceptibility Other evidence bearing on resistance is provided by the long delayed recurrence, carcinoma of the breast may be treated with apparently successful results lasting for many years —up to about twenty—and may be followed by a small recurrence in the scar It seems unlikely that this can be a second tumour arising in the breast tissue and one must accept the fact that cells have remained *in situ* but have been kept in check Support is given to the view that there is a breakdown of resistance by the fact that patients with such late recurrences fare badly and usually succumb, with widespread secondary deposits, within a year —R W Scarff The Present Status of the Cancer Problem *The Practitioner* July, 1951

CLINICAL NOTES

HAIR LOSS AND PIGMENTATION DUE TO THIOURACIL DERIVATIVES

A NONHYPOTHYROID SIDE REACTION

Morris Wilburne, M D , Beverly Hills, Calif

Among the side reactions associated with the administration of the therapeutic thiouracil derivatives propylthiouracil and methylthiouracil, in the treatment of hyperthyroidism have been leucopenia and granulocytopenia,[1] agranulocytosis,[2] anemia,[3] thrombocytopenic purpura,[4] dermatoses including pruritis and urticaria,[5] fever,[6] menstrual changes,[7] and others such as nausea, headache, arthralgia, numbness in the extremities, jaundice, Mikulicz's syndrome, and lesions resembling periarteritis nodosa However, with the exception of a recent inquiry [8] in the Queries and Minor Notes section of THE JOURNAL relative to hair loss, there appears to be no report of hair loss or pigmentation directly attributable to methylthiouracil or propylthiouracil The following is a rather striking instance of hair loss and, of lesser importance, yellowish pigmentation of the hair, the former of such pronounced degree as to necessitate discontinuance of these drugs

REPORT OF A CASE

K. W 67, a white woman, was first seen April 29 1949 because of paroxysmal auricular fibrillation and acute pulmonary edema these responded promptly to therapy Investigation revealed evidence of hyperthyroidism dating back to 1942, the earliest symptoms of which were heat intolerance, nervousness, and palpitation Three to four weeks after the onset of symptoms she developed a severe paroxysm of auricular fibrillation which precipitated acute pulmonary edema, the latter necessitating oxygen administration She remained at complete bed rest for six weeks but lost 13 pounds during this period despite her inactivity One month after she became ambulatory, another episode of paroxysmal auricular fibrillation and acute pulmonary edema occurred, she spent an additional two weeks in bed Attacks became increasingly frequent, and approximately one year later, episodes were experienced almost daily, each of one half to two hours' duration Two years after the onset she was placed on intermittent digitalis therapy, and two years later, on continuous digitalis therapy Yet her hyperthyroid state still became worse, with the greatest effect on the cardiovascular system

[8] Loss of Hair Following Use of Propylthiouracil *Queries and Minor Notes*, J A M A. **143**: 860 (July 1) 1950

Physical Examination (May 2, 1949)—Her weight was 119 pounds (54 0 Kg.), height 63 inches (160 02 cm) The hair was white, typical of senility, and was of normally abundant growth There was no exophthalmus The retinal arteries revealed moderate sclerosis The thyroid gland was asymmetrically enlarged, involving primarily the left lobe, the gland substance was soft and nonnodular Blood pressure was 200/95 Heart size was normal, rhythm was regular sinus at this examination The resting heart rate was 84 A moderately loud systolic murmur was present, with maximum intensity at the fourth left interspace 2 cm. lateral to the sternal border The aortic second sound and the pulmonic second sound were of equal intensity The skin was warm and moist Fluoroscopy disclosed slight pulmonary congestion and marked aortic sclerosis The electrocardiogram revealed left axis deviation with evidence suggesting an early left ventricular preponderance pattern Rhythm was of regular sinus origin Basal metabolism was + 35% Blood protein-bound iodine was 12 4 μ per 100 cc. Total blood cholesterol was 342 mg per 100 cc Blood count revealed hemoglobin 84%, red blood cells 5,010,000 white blood cells 7,350 with 43% neutrophiles, 1% eosinophiles, 1% basophiles, 49% lymphocytes, and 6% monocytes Urine was normal Sedimentation rate (Wintrobe) was 18 mm in one hour

Course—She continued to experience severe transitory episodes of auricular fibrillation daily, and on May 21, 1949, she was placed on methylthiouracil, 50 mg twice daily for three days, subsequently increased to four times daily Other medication consisted of digitoxin, 0 1 mg daily, thiamine hydrochloride, 10 mg three times daily, phenobarbital sodium, ½ grain (30 mg.) two to three times daily, and pentobarbital (nembutal®), 1½ grains (0 1 gm) at bedtime Therapeutic response to methylthiouracil was good, a distinct improvement occurring in all symptoms Barbiturates were discontinued on July 20, 1949 By July 23, 1949, the basal metabolic rate had declined to — 9%, and she was placed on a maintenance dose of 50 mg. of methylthiouracil daily Paroxysms of auricular fibrillation diminished in frequency to one paroxysm in six weeks Thiamine hydrochloride was discontinued, without approval, early in August On Aug. 20, 1949, the basal metabolic rate was + 8% It gradually rose, and on Oct 8, 1949, it was + 32% In the latter part of October, she noticed rather rapidly increasing loss of hair This phenomenon became so pronounced that she began to avoid combing her hair because of the ease with which it came out. The severity of the hair loss was verified by the patient's hairdresser, with whom I discussed the problem In addition both the patient and the hairdresser observed a yellowish pigmentation of the hair which had previously been white There had been no deviation from her usual hair care No new hair preparations or hairdressing procedures were employed Medication taken at this time consisted only of digitoxin (which had been increased by an additional 0 1 mg per week) and methylthiouracil, 50 mg daily Inasmuch as the patient was receiving only digitoxin and methylthiouracil, it was felt that the probable offending agent was methylthiouracil, particularly since digitoxin had been taken for several years without previous appearance of this side reaction By November 16, 1949, hair loss had assumed such serious proportions that it was necessary to discontinue further administration of methylthiouracil The basal metabolic rate on Nov 26, 1949, was + 26% Tendency to hair loss completely ceased following discontinuance of methylthiouracil therapy, but concurrently evidence of hyperthyroidism again became pronounced Quinidine sensitivity precluded its use as a prophylactic agent against the increasingly frequent paroxysms of auricular fibrillation It was apparent that some form of antithyroid medication was necessary, and on Dec 10, 1949, therapy was reinstituted cautiously, this time with propylthiouracil in place of methylthiouracil It was hoped that the former would not precipitate the hair loss and, of lesser import, pigmentation of the hair The initial dosage of propylthiouracil was 50 mg daily On Dec 31, 1949, the basal metabolic rate was + 25%, and on Feb 4, 1950, it was + 32% On the latter date the patient was again placed on phenobarbital sodium, ½ grain two to three times daily, and pentobarbital 1½ grains at bedtime Hair loss was minimal On Feb 15 1950, because of incomplete control, the dosage of propyl thiouracil was increased to 100 mg daily Within 10 days the patient reported a pronounced hair loss, however the reaction was not so severe as with methylthiouracil The basal metabolic rate on March 18, 1950, was + 30% Owing to inadequate control of the hyperthyroid syndrome and the limitations imposed on propylthiouracil dosage by the renewed problem of hair loss, radioactive iodine uptake was determined on June 6, 1950, in preparation for radioactive iodine therapy Iodine uptake was 63% despite the "blocking" effect of propylthiouracil, and on June 14, 1950, the latter was discontinued, and radioactive iodine therapy was begun the following day with an initial dose of 6 mc Hair loss disappeared rather promptly after cessation of propylthiouracil and at the time of this report, five months later, had not recurred Thiamine hydrochloride administration was resumed Aug. 2, 1950, without influence on the hair

COMMENT

It is evident from the foregoing that hair loss and pigmentation were, with little doubt, due to methylthiouracil and propylthiouracil The only other medication taken by the patient at the time of this reaction consisted of digitalis in average therapeutic dosage Earlier the patient had received thiamine hydrochloride, 30 mg daily, phenobarbital sodium, 30 mg two to three times daily, and pentobarbital, 0 1 gm at bedtime These had been discontinued at least two months prior to the onset of this side effect, any possible etiologic influence from these sources being thus excluded Further, subsequent resumption of all three drugs caused no recurrence of hair loss or pigmentation

The possibility of hair loss secondary to reduction of the basal metabolic rate to hypothyroid levels is excluded, since no clinical or laboratory evidence of hypothyroidism was manifested at any time In addition, even the euthyroid state was maintained for only a brief period before return to hyperthyroidism It is especially to be noted that hair loss occurred when the patient was, by both clinical and laboratory criteria, in a hyperthyroid state No other factors were evident, there was no deviation in mode of living or in use of hairdressing agents Finally, cessation of hair loss was twice demonstrated on discontinuance of the antithyroid drugs

SUMMARY

A case of hyperthyroid heart disease is reported in which the administration first of methylthiouracil and later of propylthiouracil produced in each instance pronounced hair loss together with moderate yellowish pigmentation of the hair Changes in dosage and discontinuance of medication resulted in parallel effects on hair loss Eventually it was necessary to cease therapy with these drugs and employ radioactive iodine The radioactive iodine did not elicit this side effect The possibility of hair loss due to drug-induced reduction of basal metabolism to hypothyroid levels is excluded, since at no time was there manifested clinical or laboratory evidence of hypothyroidism On the contrary, during the period of hair loss the basal metabolic rate was at hyperthyroid levels The effect of methylthiouracil was more marked than propylthiouracil in precipitating this reaction

APPROVED INTERNSHIPS AND RESIDENCIES IN THE UNITED STATES

ANNUAL REPORT OF INTERNSHIPS AND RESIDENCIES BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

Edward H Leveroos, M.D., William R. Albus, M.D., William W Corbc , M D., William W Southard, M.D and Reynolds Hayden, M D

Annual Report

This year, the Council on Medical Education and Hospitals presents its twenty-fifth Annual Report on Internships and Residencies It is appearing at this time rather than in the spring as in years past, in order to provide prospective applicants with more recent information about approved services at the time they apply for appointment. The report itself is based on data available as of August 1st. The statistics in the report may differ therefore, in some instances, with those found in the lists of approved internships and residencies since revisions in these lists have been made through September 1st.

In addition to listing internships on a geographical basis, including data regarding type of control, bed capacity, annual admissions, number of internships, affiliations, autopsy rates and monthly stipends, a separate section has been included listing these programs by type of service offered rotating, mixed, straight or special internships Hospitals reported by the medical schools as part of their undergraduate teaching program have been identified as major or minor teaching units, depending upon the extent to which the medical school utilizes their services in undergraduate teaching Since the publication of last year's report, there have been two major developments which are of concern to all hospitals approved for intern training the Quota Basis for the Appointment of Interns as announced in recent issues of The Journal,[1] and the Matching Plan sponsored by the National Interassociation Committee on Internships [2] A brief review of these two subjects is included in the report which follows

The section on residencies this year has also been augmented, in addition to a list of approved services by specialties, a geographical list of hospitals approved for residency training has been included, together with a summary of the specialties for which each hospital is approved Basic information regarding approved programs appears in the section in which services are classified by specialty and subspecialty The number of years for which each program has been approved is included for the following categories anesthesiology, dermatology, neurological surgery, neurology, obstetrics-gynecology, orthopedic surgery, pathology, pediatrics, psychiatry, radiology, surgery and urology In all these specialties, the length of the service for which approval has been granted has been determined in collaboration with the American Board concerned

Approval in sixteen other specialty and subspecialty fields are approved without indicating the number of years for which the program is accredited In many of these fields, however, residencies are ordinarily of one year's duration e g allergy, cardiology, contagious diseases, gastroenterology, malignant diseases, occupational medicine, pulmonary diseases, and the newest specialty for which residencies have been approved, preventive medicine and public health In other specialties, approval has been extended in concurrence with the American Board concerned without specifying the length of the program

The following boards collaborate with the Council in the approval of residency programs

- American Board of Anesthesiology
- American Board of Dermatology and Syphilology
- American Board of Internal Medicine
- American Board of Neurological Surgery
- American Board of Obstetrics-Gynecology
- American Board of Orthopedic Surgery
- American Board of Otolaryngology
- American Board of Pathology
- American Board of Pediatrics
- American Board of Physical Medicine
- American Board of Plastic Surgery
- American Board of Preventive Medicine and Public Health
- American Board of Proctology
- American Board of Psychiatry and Neurology
- American Board of Radiology
- American Board of Surgery
- The Board of Thoracic Surgery
- American Board of Urology

Residency programs in internal medicine are now approved by the Council, the American Board of Internal Medicine, and the American College of Physicians through the Conference Committee on Graduate Training in Medicine Approval in the subspecialties of allergy, cardio-vascular diseases, gastro-enterology and pulmonary diseases is granted by the Council in concurrence with the Subspecialty Board concerned

In general surgery, residencies are approved by the Council, the American Board of Surgery, and the American College of Surgeons through the Conference Committee on Graduate Training in Surgery This committee, established little more than a year ago, has been responsible for the development of a uniform set of standards for approval in the specialty, of a list of hospitals offering residency training in surgery approved by the three organizations represented on the committee, and for the establishment of a single hospital inspection procedure A number of other surgical specialty boards have expressed their interest in the possibility of developing a similar arrangement in their particular field Preliminary discussions with this end in view have been initiated in several of these specialties

[2] A description of the Matching Plan for Internship Appointment F J Mullin and John M Stalnaker National Interassociation Committee on Internships

Data in this report and in the lists of approved programs which follow, are based on information submitted by the hospitals conducting approved training programs For their co-operation in making this report possible the Council wishes to make grateful acknowledgment It also takes this opportunity to express appreciation for the splendid assistance and collaborative effort of the American College of Physicians, the American College of Surgeons and the seventeen American specialty Boards which participated in the residency approval program For their part in the preparation of this report, the Council is also indebted to medical schools and to the medical departments of the federal services With the support of all these organizations, groups and individuals, the Council is able to present this report for the guidance of prospective applicants planning their postdoctoral training as well as for the general information of the profession, medical educators, hospital administrators and others interested in graduate training

Internships

The number of internships offered in approved hospitals last year reached an all time high The upward trend which has been evident for the past ten years continued with 828 hospitals reporting that they offered a total of 10,044 internships (Table 1) On the basis of a questionnaire survey conducted early this year, it became evident that even this figure would be exceeded during the coming year In this survey, over a third of the hospitals conducting intern programs, indicated that they were increasing the number of internships they were offering to make up for the deficit in their house staffs resulting from residents being called into federal service On the basis of the information furnished by the hospitals in replying to this questionnaire, it is estimated that an additional 1,000 internships were to be offered for the coming year

Recognizing the serious problems resulting from this ever increasing disparity between the number of internships offered and the number of available applicants, the Council in June of this year revised its previous policy of approving a hospital for intern training which left the number of internships to be offered entirely to the discretion of the hospital In future, approval will be granted annually to include the specific number and type of internships for which the hospital is approved To implement this policy for this year, the Council announced a Quota Basis for the Appointment of

* Excludes territorial approved hospitals

Interns Under this program, each hospital conducting intern training was advised of approval for a definite number of internships for the year July 1, 1952-June 30, 1953 This number was based on a percentage of the internships offered in 1950 or the number offered in 1940, whichever was the larger The large majority of hospitals approved by the Council accepted the necessity of this program Since the announcement of the policy, however, approximately 15 per cent of the hospitals concerned have requested an increase in the number of their internships, in view of their expanded bed capacity, or additional activities, including those of an educational nature Further, there were a few hospitals, as was anticipated, which protested a quota basis of any sort The Council wished to give careful consideration to these requests and protests to avoid any inequities in the general application of its policy It felt also, that all other hospitals should be given an equal opportunity for a review of their status under the program It soon became apparent that time did not permit a considered evaluation of all these cases before the publication of this Internship and Residency Number Further, the approval of hospitals for a specific number of internships, directly effected the Matching Plan for internship appointments which is being sponsored by the National Interassociation Committee on Internships Again, it was recognized that it would be impossible to complete aciton on the requests for an increased number of internships in time to include the revised figure in the directory being published for the Matching Plan, a description of which is found in another section of this report In view of these considerations, the Council has deferred the quota program while strongly urging approved hospitals to cooperate on a voluntary basis in appointing interns for next year in accordance with the provisions of the quota plan

The number of internships included in the list of approved hospitals (p 388) represents the number of internships for which hospitals were approved under the quota basis, revisions in the original quota have been made for 78 hospitals whose requests could be evaluated prior to the publication of this list A number of other hospitals have requested increases in the number of internships for which they have been approved It is anticipated that action on these requests will be completed in the near future

INTERNSHIP VACANCIES

With the increase in the number of internships offered, there has been a parallel increase in the number of vacancies While last year vacancies reported represented 24 9 per cent of the total number offered, this year 32 0 per cent of available internships were reported unfilled (Table 2) Analysis of data on internship vacancies indicate that an appreciably higher percentage of vacancies existed in hospitals which were not affiliated with a medical school In these hospitals offering a total of 5,545 internships, there were 2,197 vacancies or 39 5 per cent, in the teaching hospitals, with 4,499 internships available, 1,026 or 22 8 per cent were not filled A further breakdown of these statistics reveal that the percentage of vacancies varies also with the size of the hospital, the smaller hospitals having a proportionately higher vacancy rate For example, hospitals of 150 beds or less reported unfilled, 239 of the 442 internships which they offered, a percentage of 52 9, on the other hand, hospitals having a bed capacity of 350 or over, reported that 1,151 of their 4,873 internships were not filled, representing 23 6 per cent of the total number available

As a group, the federal hospitals showed the lowest percentage of internship vacancies, 16 0 per cent, this

* Does not include 333 unclassified internships

figure excludes Veterans Administration hospitals, many of which reported vacancies on the basis of their anticipated requirements, these programs having been only recently approved Other governmental hospitals, excluding federal, reported 19 0 per cent of their internships vacant The fact that the majority of these hospitals are used for teaching purposes by medical schools *should be noted in considering their relatively low* vacancy rate In non-profit association hospitals, offering 35 9 per cent of the total number of internships, 31 9 per cent of the positions were unfilled last year Vacancies in church controlled hospitals were the highest of any group, with 45 6 per cent of the total number of internships in these hospitals reported unfilled.

It is evident, considering the fact that there were 3,223 internship vacancies in approved hospitals last year, that the present demand for interns cannot foreseeably be met The problems which have resulted from this increasing imbalance between the number of internships and the number of applicants have emphasized the need for a reclarification and redefinition of the internship and its present place in medical education To study these problems and to consider the whole question of the internship in its broadest aspects, the Council has recently appointed an Advisory Committee on Internships with representatives from the profession, medical education, the major clinical divisions and hospital administration Members of the committee include

Dr S Howard Armstrong,	Chicago
Dr Granville Bennett,	Chicago
Dr Ulrich Bryner,	Salt Lake City
Dr John Leonard,	Hartford
Dr John McK. Mitchell,	Philadelphia
Dr John Paine,	Buffalo
Dr John Romano,	Rochester, N Y
Dr Anthony J J Rourke,	San Francisco
Dr Robert Willson,	Philadelphia
Dr John Youmans,	Nashville
Dr Victor Johnson, Chairman	Rochester, Minn

The Committee has held its first meeting at which general objectives were reviewed and plans laid for the future conduct of the study

INTERNSHIPS BY TYPE OF SERVICE AND CONTROL

The Council approves three major types of internships, rotating, mixed, and straight This year, in preparing the list of internships by type of service, it was necessary to add a fourth category, so called special internships, *since a number of hospitals reported intern* training programs which could not properly be included in any of these three major classifications An analysis of internships offered last year by type of service and hospital control is given in Table 3 Federal hospitals offered a total of 646 internships, 589 of which were rotating, and 57 mixed In the other governmental hospitals, excluding the federal group, 2,791 internships were offered, of these 2,344 or 84 per cent were rotating, 80 or 3 per cent were mixed and 367 or 13 per cent were straight services Of the 6,274 offered in church, non-profit association, partnership and corporation hospitals, 5,611 representing 89 per cent of the total, were rotating in type, 105 or approximately 2 per cent were mixed, and 558, or 9 per cent, were straight, one service internships In addition, there were 333 internships which could not be classified as either rotating, mixed, or straight, in the lists of approved internships following this report (p 404), these internships are classified as special In all hospitals approved for intern training, the breakdown of internships by type of service shows that 85 4 per cent representing a total of 8,544 internships were rotating in type, 1 9 per cent or 185 internships were mixed, and 9 8 per cent, or 982 internships were straight services, an additional 333 internships were unclassified

TABLE 4 —*Summaries of Results of Trial Run of Matching Plan*

4	45	1	100
	5,063	100	

STIPENDS

Analysis of the data submitted by the hospitals relative to internship stipends indicate that there has been a further increase in salaries being offered This increase is greater in those hospitals which have no medical school affiliation While last year 63 hospitals (9 per cent) reported that they paid no salaries to the intern staff, this year there were 9 hospitals including 7 teaching hospitals which furnished only maintenance for the intern staff Sixty-two per cent of the teaching hospitals offered stipends of $62 per month or less this past year, 31 per cent paid salaries between $63-$137 per month and 7 per cent of these hospitals offered stipends in excess of $137 monthly Comparable figures for hospitals not affiliated with a medical school are as follows 24 per cent paid salaries of $62 per month or less, 58 per cent paid the intern staff between $63 and $137 monthly and the rest, representing 18 per cent of the total number, offered stipends of $138 per month or more

TABLE 5 —*Summaries of Results of Trial Run of Matching Plan*

Student Ranking of Hospital	Number Matched	Percentage	Cumulative Percentage
1	3,390	67	67
2	964	19	86
3	318	6	92
4	189	4	96
5	83	2	98
6	55	1	99
Below 6	64	1	100
	5,063	100	

There is a correlation in the data submitted by the hospitals between the salary scale and the size of the hospital In analyzing salaries in the range between $88 and $162 per month, it is found that while 65 per cent of the non-teaching hospitals with bed capacities of 150 or less offer stipends in this range, only 37 per cent of non-teaching hospitals of 350 beds or over, reported stipends of these amounts The correlation was even more apparent in the teaching hospitals In this group, 37 per cent of the hospitals of 150 beds or less, offered salaries between $88 and $162 monthly, in teaching hospitals of 350 bed capacity or larger, only 12 per cent gave their interns salaries within this range

No specific information regarding stipends paid by the federal services is presented in the list of approved services Interns appointed by the medical departments of the U S Army, Navy, Air Force and Public Health Service receive pay and allowances as established by government pay tables In Veterans Administration hospitals, salaries are based on levels prevailing in the area, as determined by the Veterans Administration in cooperation with the local Deans Committee Internships have been offered only in those Veterans Administration hospitals which are able to provide quarters for the intern staff on the hospital grounds

MATCHING PLAN FOR INTERNSHIP APPOINTMENT

During the past year, a trial run was made of a method of internship appointment in which students internship preferences were matched with the hospital's rating of the applicants This project was conducted by the National Interassociation Committee on Internships under the sponsorship of the Association of American Medical Colleges Although the run was begun late in the year and under simulated conditions, the results were such as to warrant the adoption of the Matching Plan[3] as the official method of internship appointments for the coming year

A description of the Matching Plan and a résume of the trial run this past year have been sent to all hospitals approved for intern training In the summary of the results of the trial run, it is pointed out that a successful matching occurred in 5,063 cases of the total number of 5,539 students who participated Under actual operating conditions, the number of students who would not be successfully matched will be extremely limited, most of the cases which were not matched in the trial run resulted from incomplete or inaccurate records received from either the applicant or the hospital These will be eliminated in the actual operation of the plan this year Tables 4 and 5 summarize the results of the matching of the 5,063 cases in the matched group Under the provisions of the plan, hospitals rated applicants in order of their preference or by groups as follows

Group 1	Includes those students most preferred by the hospital This group is limited to the number of appointments actually to be offered
Group 2	Includes those students desired by the hospital as alternates to Group 1 The number of students rated in this category is limited to twice the number of appointments to be offered
Group 3	Includes those students considered acceptable for appointment The number of applicants rated in this category is not limited
Group 4	Includes those students who are desired by the hospital if those in Groups 1-3 are not available Ordinarily, ratings in this group are necessary only in hospitals appointing a large number of interns
Group 5	Used by the hospital to designate students who will not be offered an appointment, were they to apply

The student in turn rated hospitals in the order of his preference as to appointment He listed all hospitals to which he presumably would apply It will be seen from the summaries that the large majority of students were matched with a hospital of first or second choice Obviously successful matching at this level will depend to some extent on the student's realistic appraisal of his opportunities for appointment In this regard, it is interesting to note that in this trial run, realizing that no actual appointments were being made, students were matched with hospitals of their first or second choice in 86 per cent of cases In only one per cent of the cases, was a student matched with a hospital which he had rated lower than sixth on his list The results so far as the hospitals were concerned, were equally as encouraging With 654 hospitals participating in the trial run, 91 per cent of the applicants who were successfully matched, were in the most desirable and alternate groups, 1 and 2, 8 per cent of the appointees were rated by the hospital as acceptable and only one per cent as acceptable only if other applicants were not available Considering that this was a trial run, the results exceeded the expectations of the Committee when the project was initiated and proved the feasibility of the plan

The Matching Plan is now being sponsored by the National Interassociation Committee on Internships and is the official plan for the appointment of interns this year This committee includes representatives from the following organizations Council on Medical Education and Hospitals of the American Medical Association, the Association of American Medical Colleges, the American Hospitals Association, the Catholic Hospital Association and the Protestant Hospital Association The medical departments of the federal services have liaison representatives on the committee, one of whom is elected as a voting member

The National Interassociation Committee on Internships has recently circularized all hospitals approved by the Council for intern training, as to their participation in the Matching Plan for appointments beginning next year A directory of approved internships will soon be distributed to all senior medical students with instructions concerning procedure in applying for internship appointment Students pay a service fee of $2 00 to the National Interassociation Committee when submitting an agreement to participate in the plan Participating hospitals pay a fee of $3 00 per intern appointed under the Matching Plan at the time appointments are made The hospital agrees to comply with the provisions of the plan in submitting its initial agreement

Internship appointments in U S Army, Navy, Air Force and Public Health Services hospitals are made through the offices of the Surgeon General Accordingly, students, under the Matching Plan, will list the federal services for which he is applying, in his preference list, rather than the federal hospitals to which he might desire to be assigned If matched with a federal service then, he may apply to the Surgeon General for a specific assignment In cases of Veterans Administration hospitals, however, since appointments are made locally, the student will list the particular hospital or hospitals to which he is applying, in his preference order

---

[3] J A. M. A Vol. 145 No 17 April 28 1951

It should be noted that the Matching Plan is a mechanism for facilitating the appointment of interns and it in no way interferes with a student's free selection of the hospital of his choice or with the hospitals preliminary negotiations with the student The student applies to the hospital in the usual way and to as many as he may desire He does agree, however, to accept appointment to the hospital with which he is matched according to his expressed preference The hospital is free to correspond with and interview all applicants in whom it is interested The hospital, like the student, agrees not to enter into any contractual relationship until after appointments have been made through the student-hospital matching procedure, and agrees further, that it will appoint those students on its list who are matched with the hospital under the provisions of the plan Policies regarding procedural matters are established by the National Interassociation Committee prior to the actual matching, to eliminate the necessity of interpretation in individual cases

The Council on Medical Education and Hospitals has approved the Matching Plan and is cooperating in implementing the plan for the appointment of interns this year It is of the opinion that all approved hospitals should give wholehearted support to the plan as a sound method of intern appointment which is fair and impartial to both the student and the hospital

Residencies

As of Sept 1, 1951, there were 1,120 hospitals conducting 4,368 residency programs approved by the Council Included are residencies in the following specialties and subspecialties

Medical
Dermatology-Syphilology
Internal Medicine
  Allergy
  Cardiovascular Diseases
  Gastroenterology
  Pulmonary Diseases
Neurology
Pediatrics
  Contagious Diseases
Physical Medicine
Psychiatry

Special
  General Practice
  Malignant Diseases
  Occupational Medicine
  Preventive Medicine Public Health

Surgical
Anesthesiology
General Surgery
Neurological Surgery
Obtetrics-Gynecology
Ophthalmology
Orthopedic Surgery
Otolaryngology
Plastic Surgery
Proctology
Thoracic Surgery
Urology

Laboratory Services
Pathology
Radiology

A résumé of the number of approved programs, the number of residencies offered and the number and percentage of vacancies, by specialties is contained in Table 6 The statistics regarding the number of approved hospitals and the number of residencies offered may differ in some specialties from those found in the lists of approved services since the table is based on data available Aug 1, 1951 while changes in the approved lists were made through September 1

Internal Medicine again leads all other specialties in the number of residencies available, with 3,873 residencies offered in 559 hospitals, this represents an increase over last year of 122 residencies and 31 additional hospitals approved In General Surgery, 474 hospitals offer a total of 3,698 residencies In addition, there are 1,075 appointments in 133 hospitals approved by the Council as offering satisfactory training in general surgery in preparation for the surgical specialties[4] Other specialties in which there are 1,000 or more residencies offered include psychiatry, 1,768, obstetrics-gynecology, 1,599, pathology, 1,108, and radiology, 1,075

For the first time, approved programs in preventive medicine and public health are included with 12 states and New York City sponsoring programs in this field Another change this year is the classification of orthopedic surgery services into three categories fully approved three year programs, which include training in adult orthopedics, children's orthopedics, fractures and the basic science aspects of the specialty, three year programs which include all the above divisions with the exception of children's orthopedics, and a third category which includes those hospitals offering partial training in one or more but not all divisions of the specialty The lists of these services were developed in collaboration with the American Board of Orthopedic Surgery This type of listing will enable prospective residents to refer more readily to those programs which best fit their individual training requirements It also serves to simplify the evaluation of the resident's training In the list of approved residencies, the number of first year appointments is given, as well as the total number of residencies offered

RESIDENCY VACANCIES

Table 6, as previously noted, also includes information on the number and percentage of residency vacancies Hospitals approved for residency training reported a total of 4,869 vacancies as of Jan 1, 1951 This number has undoubtedly increased since the first of the year, with the entrance into military service of residents serving at that time Last year, there were only 1,179 positions reported vacant, representing approximately 6 per cent of the total number offered The figure this year reveals that twenty-five per cent of all residency appointments were unfilled This reflects the fact, not only that residents have been called for military duty before completing their training, but also, and perhaps of more significance, that, to an increasingly greater extent, hospitals are having to rely on the intern class to fill their residency positions The number of applicants seeking residencies, aside from the intern group, is unquestionably decreasing It can be anticipated that this trend will continue at least until such time as interns and residents now entering military service are released

---

[4] J A M A Vol 142 No 15 April 15 1950 p 1216

The greatest percentage of vacancies occurred in the following fields physical medicine, 58 per cent, malignant diseases, 50 per cent, cardiovascular diseases, 47 per cent, pulmonary diseases, 45 per cent, contagious diseases, 45 per cent and surgical programs in preparation for the specialties, 45 per cent The relatively high percentage of vacancies in this latter category can be partially accounted for by the fact that approval for this type of program has been introduced relatively recently In point of numbers, internal medicine was the highest with 924 vacancies reported There were 642 surgical residencies unfilled, 534 vacant positions in psychiatry and 430 in pathology The number of vacancies in obstetrics-gynecology have increased sharply, while last year there were only 30 positions reported unfilled, this year, 333 residencies in this specialty were vacant as of Jan 1st last Of the specialties in the major clinical divisions, pediatrics showed the fewest number and lowest percentage of vacancies with 185 residencies unfilled, representing approximately 15 per cent of the total number offered

While it has been reported that there has been an increasing interest in general practice among medical students, the number preparing for this type of practice by taking a general practice residency has not been great Last year, of the 224 positions available, 57 or 25 per cent were vacant A number of these programs were approved during the past year however, and vacancies as of Jan 1, accordingly, were to be expected Undoubtedly, a number of physicians enter general practice directly from the internships, others take one or more years of training in a specialty, such as internal medicine, surgery, obstetrics-gynecology or pediatrics Since residencies in general practice were only introduced within the past two years, it is not possible to make significant comparisons relative to the number of residents in these training programs nor to the number of vacancies

It is apparent from a review of the data presented in Table 6, that the situation which obtained in the postwar period, when the number of applicants exceeded the number of available appointments, has now been completely reversed in all specialties While the rapid expansion of the residency program during the past several years has leveled off, the number of residencies presently available presents a problem which will require thoughtful study and consideration

APPROVED INTERNSHIPS

Council on Medical Education and Hospitals of the American Medical Association
535 North Dearborn Street, Chicago 10

Revised to September 1, 1951

HOSPITALS, 844 INTERNSHIPS, 9,278

The following general hospitals, investigated and approved by the Council on Medical Education and Hospitals, are considered in position to furnish acceptable intern training in accordance with standards adopted by the American Medical Association Three types of internships are approved by the Council—*rotating, mixed* and *straight*

1 A rotating internship is defined as one which provides supervised experience in internal medicine, surgery, pediatrics, obstetrics and their related subspecialties, together with experience in laboratory and radiologic diagnosis

2 A mixed internship is defined as one which provides supervised experience in two or more, but not in all, of the clinical divisions named

3 A straight internship is defined as one which provides supervised experience in a single department, although it may include limited opportunity for work in a related subspecialty Straight internships are now approved in internal medicine, surgery, pediatrics, obstetrics (with or without gynecology) and pathology

The number of internships listed for each hospital is that established under the Quota Basis for the Appointment of Interns A number of these hospitals have requested a revision in the number of internships for which the hospital is approved Action on these requests will be completed on or before October 15 The program has presently been placed on a voluntary participation basis. Hospitals are strongly urged, however, to co-operate under the provisions of the program, in the appointment of interns for the year 1952-1953

Hospitals approved for internships that are used by medical schools for undergraduate clinical clerkships on inpatient services have been identified in the following lists by the symbols **X** and **x** Hospitals have been identified with symbol **X** when a medical school *has indicated that the hospital is a major unit in the school's teaching program* Hospitals have been identified with the symbol **x** when a medical school has indicated that the hospital is used to a limited extent in the school's teaching program Certain internships in hospitals designated as teaching hospitals may not provide for assignments to teaching services Other internships may provide for only a portion of the internship period being spent on teaching services Prospective interns desiring specific information concerning internship assignments to teaching services in a hospital are advised to communicate with the dean of the medical school with which the hospital is affiliated Medical school affiliations are indicated by footnotes 10 to 83 placed immediately after the symbol **X** or **x** The list of medical schools appears on page 398 The plus (+) sign indicates additional approval for residencies in specialties, as shown in the Council s list of Approved Residencies and Fellowships

HOSPITALS APPROVED FOR INTERNSHIPS IN THE DOMINION OF CANADA

The following list of hospitals which conform to the standards of the Canadian Medical Association is published for the information of graduates interested in an internship appointment in a Canadian hospital. The Council considers that hospitals which are unqualifiedly approved as conforming to the standards of the Canadian Medical Association may be considered as offering internships equivalent in educational value to those in hospitals approved for intern training by the Council. This does not apply however to that group of hospitals referred to as Commended under the Canadian plan

The following list of hospitals revised to July 1 1951 has been furnished by the Canadian Medical Association

Name of Hospital	Location
Camp Hill Hospital	Halifax, N S.
Halifax Infirmary	Halifax N S.
Victoria General Hospital	Halifax N S
St. John General Hospital	St John N B
Saint Sacrement Hospital	Quebec Que
Hospital Dieu de Quebec	Quebec Que
Hospital of the Infant Jesus	Quebec Que
Jeffrey Hale's Hospital	Quebec Que
Veterans Hospital	Quebec Que
Children's Memorial Hospital	Montreal Que
Herbert Reddy Mem Hospital	Montreal Que.
Homeopathic Hospital	Montreal Que
Hospital Notre Dame	Montreal Que
Hospital Ste Jeanne d'Arc	Montreal Que

APPROVED RESIDENCIES AND FELLOWSHIPS

Council on Medical Education and Hospitals of the American Medical Association
535 North Dearborn Street Chicago 10

Revised to September 1, 1951

Hospitals, 1,120, Assistant Residencies, Residencies and Fellowships, 19,852

The following services are approved by the Council on Medical Education and Hospitals as meeting the requirements of the Essentials of Approved Residencies and Fellowships In those specialties in which certifying boards have been established approval is extended in concurrence with the Board concerned The number of years of training for which approval has been granted is indicated in the column Length of Approved Program (years)" Residencies in which this designation does not appear have been approved without specifying the number of years for which they are accredited

The (*) indicates hospitals approved for intern training The numeral (1) is used to designate services, appointments to which are open to women The (†) represents temporary approval, pending formal inspection, in accordance with the plan announced in THE JOURNAL, March 2, 1946, p 586 Granting of approval on this basis has been terminated by action of the Council and the Advisory Board for Medical Specialties Hospitals temporarily approved prior to this action currently are being inspected to determine whether or not approval should be continued and if so, the number of years of training for which they will be accredited The beginning stipends for federal hospitals have not been listed, they are established in accordance with government pay tables

16 OTOLARYNGOLOGY

The following services have been approved by the Council and the American Board of Otolaryngology This approval is considered effective through July 1, 1952 Prior to that date, all services presently approved will be reviewed to determine whether or not approval will be continued and to determine also the number of years of training in individual hospitals for which approval will be granted

A revised list of approved residencies in otolaryngology will appear in an issue of The Journal, the latter part of December Physicians planning to apply for residency training in otolaryngology to begin on or after July 1, 1952 should consult this list in making application for appointment

★ Indicates hospitals approved for training interns

† Indicates temporary approval

1 Residencies open to women

2 Approved for training in Syphilology only

3 Includes one year fellowship in Immundo-Hematology

4 May include one year in the Medical Research Institute (and Postgraduate School)

5 Approved as offering acceptable affiliated training (maximum three months) in concurrence with the American Board of Pediatrics

6 Maximum of six months training in Contagious Diseases accepted by the American Board of Pediatrics

7 May include six months assignment to Department of Rehabilitation and Physical Medicine approved program

8 Includes Fellowships

9 Clinical data included in Neurology

10 Includes one year Fellowships available in psychosomatic medicine

11 Clinical data included in Otolaryngology

12 Clinical data included in Psychiatry

13 May include training Home Care Service

14 May include fellowship training in Cardiology

15 Includes six months assignment Ohio State University Medical School Columbus Ohio

16 May include assignment to the Institute for Cancer Research and Lankenau Hospital Research Institute Philadelphia

17 May include one year of fellowship in division of Endocrinology

18 Primary service at Chicago Tumor Institute

19 Affiliated with Bingham Associates Laboratory Holyoke Massachusetts

20 Affiliated with Neurological Institute New York City

21 Affiliated with Institute of Ophthalmology

22 May include one year fellowship in the Department of Oncology

23 Includes assignment at Urologic Clinic Philadelphia

24 Apply Office of Graduate Medical Education University of Colorado Medical Center

25 Apply Medical College State of South Carolina

26 May include training in Allergy

The following hospitals offer acceptable training which is integrated with or contributing to the fully approved program in the listing of which the footnote reference appears

27 Walter Reed General Hospital and Army Medical Department Research and Graduate School.

28 Brooke General Hospital 4th Army Medical Laboratory and Medical Field Service School

29 Veterans Administration Hospital Newington Conn

30 Beverly Hospital Beverly Mass

31 Children's Orthopedic Hospital Seattle Wash

32 May include one year of training in the Department of Surgical Pathology

33 Milwaukee County Hospitals and Institutions

34 Cowell Memorial Hospital Berkeley Calif

35 Arlington Hospital Arlington Va

36 May include one year of training in Chronic Diseases at Jewish Hospital Roxbury or Holy Ghost Hospital Cambridge Mass

37 University of California San Francisco

38 Nebraska Methodist Hospital Omaha

39 Allegheny Hospital Cumberland Md

40 Norton Infirmary and Veterans Administration Hospital Louisville General Hospital Louisville Ky

41 Good Samaritan and St Vincent's Hospital Portland Oregon

GRADUATE TRAINING PROGRAMS

Acceptable by the American Board of Psychiatry and Neurology

The Council on Medical Education and Hospitals has limited its approval of programs for graduate training to those offered in connection with general or special hospitals The following information is published, however, at the request of the American Board of Psychiatry and Neurology to indicate the availability of a special type of training which is acceptable to the board and carries full credit toward certification by that board

REQUIREMENTS FOR ACCEPTANCE

In order to facilitate the arrangements for training in child psychiatry (which constitutes a major aspect of modern psychiatry), the American Board of Psychiatry and Neurology will accept one year of training in psychiatric clinics for children which may or may not be a part of a hospital approved for residency training provided such a clinic gives adequate supervision and instruction for full time training during the entire third year of the required three year formal training period For the purpose of evaluating such clinics, the following conditions and criteria are deemed essential by the American Board of Psychiatry and Neurology

1 That the clinic have a full time medical director, psychologist, and social worker qualified by training and experience in child psychiatry and allied fields to supervise the training of residents

2 That the major portion of such training be devoted to therapy adequately supervised by this qualified staff

3 That the service and teaching activities of the clinic be integrated with those of the community and its social agencies

4 That clinic work be supplemented by seminars, case conferences, journal clubs or other opportunities for the discussion of the basic principles involved in outpatient work with children and parents teacher, public health and welfare agency personnel

5 That such a training clinic be well established in the community with a qualified staff that has operated together long enough as a team to insure stable and sound functioning

6 That the senior members of the clinic team show evidence of previous experience in the teaching of psychiatry in general child psychiatry in particular and their allied fields

These criteria set forth by the Board pertain more particularly to community sponsored clinics offering full time training in child psychiatry during the third year of formal residency training If these clinics are affiliated with hospitals already maintaining approved programs, separate approval is not required unless warranted on the basis of their meeting all requirements for straight fellowship training in child psychiatry

The following clinics are acceptable to the American Board of Psychiatry and Neurology as qualifying under these provisions

Center	Director
Pasadena Child Guidance Clinic 40 E Dayton Central Park Pasadena 2 Calif	Dr M B Durfee
Children s Psychiatric Division Langley Porter Clinic San Francisco	Dr Stanislaus Szurek
Institute for Juvenile Research 907 S Wolcott Ave Chicago	Dr Sophie S Sloman
Louisville Mental Hygiene Clinic and Child Study School 610 S Floyd Street Louisville Ky	Dr Spafford Ackerly
The Guidance Center 1737 Prytania Street New Orleans	Dr Milton F Kirkpatrick

Cleveland Guidance Center 2525 Euclid Avenue Cleveland	Dr Claire M Ness
Child Guidance Clinic 1711 Fitzwater Street Philadelphia 46	Dr Frederick H Allen
Pittsburgh Child Guidance Clinic 3004 Victoria Street Pittsburgh 13	Dr Harry M Little
Children s Service Center of Wyoming Valley 335 South Franklin Street Wilkes Barre Pa.	Dr J Franklin Robinson

APPROVED EXAMINING BOARDS IN MEDICAL SPECIALTIES

Examining and certifying boards in 19 specialties have been approved by the Council on Medical Education and Hospitals of the American Medical Association The American Board of Ophthalmology, the first of the examining boards in the specialties, was organized in 1917 Four additional boards were organized by 1933 In 1934, the Council formulated minimal standards governing specialty boards The boards then in existence as well as boards formed in later years were subsequently approved as meeting these requirements All boards at present functioning have been approved by the Council and the Advisory Board for Medical Specialties

Two boards certify candidates in subspecialties The American Board of Internal Medicine certifies in allergy, cardiovascular disease, gastroenterology, and pulmonary diseases and the American Board of Pediatrics certifies in allergy Certification in the major field is a prerequisite for certification in these subspecialities

The Board of Thoracic Surgery is organized as an affiliate board to the American Board of Surgery, with prior certification in surgery a requirement for the certificate in thoracic surgery

Five boards confer certificates in special divisions of their specialty The American Board of Obstetrics and Gynecology will issue single certifications in gynecology or obstetrics only Otolaryngology grants a limited certificate in endoscopy Pathology issues certificates in pathologic anatomy, clinical pathology, a combination of these two fields, pathologic anatomy and clinical microbiology, clinical bacteriology, and clinical microbiology and clinical chemistry The Board in Psychiatry and Neurology confers separate certificates in psychiatry and in neurology or a combined certificate for those qualified in both fields This board also issues supplementary certificates in psychiatry and in neurology Radiology issues certificates in radiology, roentgenology, diagnostic roentgenology, therapeutic radiology and radium therapy

Each of the American boards has published a booklet containing a list of its officers and a brief statement of its organization, purposes and qualifications for eligibility for certification The current data pertaining to each board and the names of the officers of each board are reproduced in the following pages There is also included in this section specific statements from each board pertaining to allowances of credit for service in the armed forces during the present emergency A resume of medical education and national defense was published in the Educational Number of THE JOURNAL [1]

A list of the approved specialty boards, the year of their activation, and the number of certificates awarded prior to July 1, 1950, and the number of candidates certified to June 30, 1951, respectively, appear in Table 1 Figures are also given in these two groups showing the numbers certified in the subspecialties and finally the available figures pertaining to special certification by the boards in obstetrics and gynecology, otolaryngology, pathology, psychiatry and neurology and radiology

---

* Included in totals for American Board of Surgery
† Independent board established in 1949
‡ Certificates issued since July 1 1949
§ *Previous diplomates* Not included in totals
ᶜ Certificates issued since July 1 1948

On July 1, 1950, there were 39,804 physicians who had been certified by the 19 boards in operation, 5,074 were certified from July 1, 1950, to June 30, 1951 Up to this latter date a total of 44,878 physicians had been certified

In the subspecialties, by July 1, 1950, 1,142 certificates had been awarded An additional 50 have been awarded during the past year, bringing the total certificates issued in the subspecialties to 1,192 on June 30, 1951

Prior to July 1, 1950, there were 4,528 special certificates issued by the five boards mentioned An additional 1,033 were issued in the year ending June 30, 1951 The total special certificates awarded to date numbers 5,561

Table 2 records the number of specialists certified by the American boards each year during the past 12 years and the cumulative totals In this period 44,878 certificates were issued The figures represent the total number of certificates issued and do not represent the number of living specialists

The fifth edition of the "Directory of Medical Specialists" compiled by the Advisory Board for Medical Specialties, published in 1951, includes biographic data pertaining to the educational background of each of the living specialists, including those retired from practice, certified by an American board

TABLE 2—*Annual Specialty Board Certification 1940 1951*

* One Board the American Board of Proctology did not certify any candidates during this period

CREDIT FOR MILITARY SERVICE

At the suggestion of the Joint Committee on Medical Education in Time of National Emergency, the Advisory Board for Medical Specialties has recently conducted a survey to determine the amount of credit for service in the armed forces during the present emergency that would be given toward specialty board certification The inquiry addressed to the boards contained the following questions

> Will your specialty board give preference to those candidates wishing to be examined before going overseas or entering military service?
>
> How much, if any, credit toward your training and/or experience requirements will your board allow candidates while in military service?

In reply to the first question all boards answered in the affirmative The specialty boards have not lowered their requirements because of the military emergency, but all boards have indicated they will grant some credit for military service The specialty boards have indicated such allowances as follows

Anesthesiology—Credit for training will be given when it is in a formal approved program Other cases will be decided on an individual basis by the board

Dermatology and Syphilology—Automatic credit is allowed for one year toward the experience requirements plus credit for training in individual cases

Internal Medicine—One year of graduate training or one year in partial satisfaction of practice requirements Additional credit on the merits of each individual case

Neurological Surgery—Credit will be allowed toward training requirement if candidate is assigned to neurologic surgery in a military hospital, also, credit will be allowed for practice requirement if assigned to neurologic surgery

Obstetrics and Gynecology—Six months to three years depending on assignment For post-training practice credit, full time credit will be given as substitute Physicians called to active military service may make arrangements to take the examinations of the board at their place of duty

Ophthalmology—No stated credit Each case is decided according to the time the candidate has spent assigned to a military hospital in ophthalmology and on other factors

Orthopedic Surgery—One year of practice credit and one year of residency credit The same year cannot be credited for both residency and practice credit

Otolaryngology—Credit is given but each case is determined on its own merits

Pathology—Allows liberal credit toward training when assigned to department of pathology but candidates must first have had a minimum of one year residency in an approved civilian department of pathology

Pediatrics—One year of credit, regardless of assignment, towards two year practice requirement

Physical Medicine and Rehabilitation—Maximum of one year credit in related field, full credit if in the specialty

Plastic Surgery—Credit given on individual basis, considered on candidate's merits

Preventive Medicine and Public Health—Full credit if service is in the specialty A maximum of six months' credit for general military duties

Proctology—One year in fulfillment of either general surgical or proctologic requirements

Psychiatry and Neurology—Credit will be granted for military duty in the present emergency under certain conditions This policy relates to active duty since July 1, 1950 One year of training credit will be granted for one year spent in full time psychiatric and/or neurological duties Additional training credit will be granted for that amount of time spent in approved training programs Experience credit will be granted for any remaining time spent in full time psychiatric and/or neurological assignments Double credit will not be granted for any single period of time

Radiology—One year if assignment is in radiology

Surgery—Credit is allowed but each case is decided on its merits

Thoracic Surgery—Special consideration will be given individuals who have had special training in thoracic surgery during their period of military service Since this board operates as an affiliate of the American Board of Surgery, credit will have already been granted them by the latter board Examinations will be made available at regular intervals to members of the armed forces who are out of the country

Urology —No credit for training but credit for one year of practice requirement if training was complete when entering service

Medical Officer's Professional Training Record —The Surgeons General of the armed services have distributed a booklet prepared with the assistance of the Council and the Advisory Board for Medical Specialties which is designed to help prospective candidates for certification to maintain an accurate account of work done in the military service This record will constitute part of the credentials to be submitted to the board on application for certification The booklet has been printed by the Office of the Secretary of Defense and is distributed by the offices of the Surgeons General to the personnel of their department It is highly important that prospective applicants obtain a copy of the "Medical Officer's Professional Training Record" and that they submit their credentials for evaluation by the respective specialty board

AMERICAN BOARD OF ANESTHESIOLOGY

Board of Directors

Charles F McCuskey, President, Los Angeles
Rolland J Whitacre, Vice President, East Cleveland.
Donald L Burdick, New York
Stuart C Cullen, Iowa City
Frederick P Haugen, Portland, Ore

*Ralph M Tovell, Hartford, Conn
*Ralph M Waters, Orlando, Fla
John W Winter, San Antonio, Tex
*Paul M Wood, New York
*Philip D Woodbridge Greenfield, Mass

---

*Past Presidents

CERTIFICATION

1 *Method of Making Application* —Application for certification may be made after a physician has completed one year of approved training *Application must be made to the secretary* on a form prescribed by the board, procured only on written request of the applicant and must be filed at least six months prior to the date of examination

The secretary cannot make any *eligibility rulings* These are made only by the entire board on recommendation of the appropriate committees after reviewing the candidate s formal application

2 *Requirements*

A *Each applicant before he shall become eligible for certification in anesthesiology, must*

1 Have graduated from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association, and have completed an internship of not less than one year in a hospital approved by the same Council, or its equivalent

2 Establish in a manner satisfactory to the board that

(*a*) He is a physician duly licensed by law to practice medicine

(*b*) He is of high ethical and professional standing

(*c*) He has received adequate special training in anesthesiology

3 Submit proof to the board that he has limited his practice to anesthesiology as a specialty for five calendar years of which at least two have been in formal clinical training approved by the board, and that he intends to continue to limit his practice to anesthesiology

4 Be a member in good standing in the American Medical Association, the state and local county medical society or comparable national medical society approved by this board He must be a member in good standing of the American Society of Anesthesiologists, Inc

5 Prove to the satisfaction of the board by such written, survey, oral and practical examinations as the board may prescribe that he is qualified to practice anesthesiology, and

6 Personally prepare such case history abstracts of personally conducted procedures pertaining to anesthesiology as the board may specify

B Each applicant shall be classified for the purpose of examination and shall be examined in such a manner and under such rules as the board may prescribe

3 *Conduct of Examinations*

A Written Examination Eligible applicants may take this examination on completion of two years of clinical training approved by the board Written examinations are held annually in approximately twelve locations throughout the United States on the third Friday in July Written examinations are of the *multiple choice type covering the following subjects* anatomy, chemistry and physics, pharmacology, pathology and physiology A passing grade, as determined by the board is required

B Survey Examination Started in 1949 this examination is conducted by one or more diplomates of the board who visit the applicant in his own locality to observe him in the practice of anesthesiology The examiner may interview other individuals in the community to determine whether the candidate is of high ethical and professional standing This examination is conducted on completion of four years limited to anesthesiology (including two years of approved clinical training)

C *Oral Examination* On completion of a favorable survey examination and five years limitation of practice to anesthesiology an applicant is eligible to appear for oral examination Examinations are conducted semi annually, in April and October Examiners consist of directors of the board plus diplomates who assist as associate examiners Oral examinations cover all phases of anesthesiology as do the written examinations, emphasis, however, is placed on clinical application

D Practical Examination At the discretion of the board practical demonstrations may be required of the management of the candidate's clinical practice in his local surroundings This may include inspection of clinical records, reports of departmental activities, library facilities, available apparatus and demonstrations of application of anesthetic agents, methods and all technics included in anesthesiology The candidate will also be appraised as to whether he is of high ethical and moral standing in his community

Applicants are entitled to *three consecutive opportunities* at *yearly intervals* to satisfactorily complete either the written or oral examination This three year period begins on the date an applicant is first declared eligible for the written or oral examination Applicants who fail to exercise the privilege of examination and/or who fail to pass any part of the examination three times will be required to file a new application, pay a new application fee, and submit to both *written and oral* examination

A fee of $15 00 will be charged for each reexamination for candidates who file application January 1, 1950 or later *The* board may, however, at its discretion *deny* a candidate the privilege of reexamination

The board reserves the right to limit the number of candidates to be admitted to any examination

FEE

The fee shall be $125 At least $50 shall be paid on filing the application, of which sum $35 shall be returned if the candidate is not accepted for examination The remainder ($75) shall be paid before taking the examination

The board is a nonprofit organization The fees for examination and certification have been computed on a basis of cost of maintaining an administrative office and conducting examinations The board reserves the right to increase the fee when necessary

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY

ANTHONY C CIPOLLARO, President New York
DONALD M PILLSBURY, Philadelphia
NELSON P ANDERSON, Los Angeles
J LAMAR CALLAWAY, Durham, N C
ARTHUR C CURTIS, Ann Arbor, Mich
JOHN H LAMB, Oklahoma City

GEORGE M MACKEE, Stamford, Conn
HENRY E MICHELSON, Minneapolis
PAUL A O LEARY, Rochester, Minn
BEDFORD SHELMIRE, Dallas, Tex
ARTHUR W STILLIANS, Chicago
FRED D WEIDMAN Philadelphia

PURPOSES

The board was established primarily to determine the competence of physicians who specialize in dermatology and syphilology It has therefore established minimum standards of education and training, examines applicants and certifies properly qualified specialists in this field, prepares lists of those qualified and arranges for the publication of such lists Because of its interest also in the fulfillment of these standards, the board has a keen interest in the development of adequate training facilities, investigates institutions and individuals planning to train specialists, and lends its aid to the approval of those institutions and individuals offering adequate training in the specialty The board, in addition, will always be glad to advise physicians desiring to enter this special field of medicine

The board assumes the responsibility of determining the standards of knowledge to be acquired, but upon the candidate rests the responsibility of acquiring the knowledge to fulfil these standards

REQUIREMENTS FOR ELIGIBILITY FOR EXAMINATON

I GENERAL REQUIREMENTS

1 High ethical and professional standing

2 Graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association The credentials of graduates of foreign schools must be approved by the National Board of Medical Examiners The status of the foreign medical school at the time of graduation may be determined by the Council on Medical Education and Hospitals of the American Medical Association Failing this each case will be decided on its own merits

3 Satisfactory completion of an internship of not less than one year in a hospital approved by the same Council During three years of the second World War internships of nine months only were the rule These were voted to fulfil the internship requirement However, all internships completed on July 1 1947 or thereafter must be of twelve months duration or longer

4 A state license to practice medicine issued by endorsement of the certificate of the National Board of Medical Examiners or following examination

5 Membership in the American Medical Association or membership in a similar society recognized as having the same purpose as the American Medical Association

6 Citizenship in the United States or citizenship—meaning native citizens—in Canada or Cuba

II SPECIAL REQUIREMENTS

A period of study, after the internship of not less than three years Up to one month in each of the three years may be spent as a vacation but the exact time is a matter for the chief of service to decide Vacations may not be postponed from one year to another Candidates will not be eligible for examination until three full years have elapsed since the beginning of training This training may be obtained as resident, fellow or graduate student in clinics, dispensaries, hospitals or laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association and approved by the American Board of Dermatology and Syphilology as competent to provide a satisfactory training in dermatology and syphilology This period of specialized training shall include

(*a*) At least one calendar year in an institution approved for three year training (less one month for vacation)

(*b*) Graduate training in the basic medical sciences which are necessary for the proper understanding and treatment of the diseases involved in this specialty

Instruction in the following fundamental subjects as related to the skin is deemed advisable by the board embryology histology chemistry, physiology, bacteriology, mycology, parasitology, pathology immunology serology pharmacology and materia medica, and physics of physical therapy

(*c*) Carefully supervised clinical and laboratory experience in the specialty

(*d*) Annual examinations or other appraisal by the chief of service in the clinical, laboratory and public health aspects of dermatology and syphilology

PRECEPTORSHIP TRAINING

Candidates may spend up to two years of theor training under the direction of a diplomate of the board, who has also been approved as a preceptor by the board Not more than one half of each training day may be spent in the office of the preceptor while during the other half day, supervised work should be performed in an approved institution The program which the student follows must conform to a schedule which an approved preceptor files with the board The preceptor and the chief of service of the institution which the candidate attends are jointly responsible for the training received by the student Preceptorship training may be taken during any two of the years of training Time spent with an instructor who has not been approved by the board may count only as experience and not as training A list of approved preceptors is available in the office of the secretary

To qualify as an approved preceptor, a dermatologist must be a diplomate for at least five years, be a recognized teacher, be an active member or professor emeritus of the dermatologic staff of an approved institution and be recommended as suitable by the chief of staff of the institution He must further submit an adequate program of instruction with provision for supervision of both office and hospital work

PRELIMINARY REGISTRATION

All students beginning their graduate training should file a preliminary registration form with the secretary A standard form will be sent on request No fee is required Any deficiencies in credentials would be detected early in the training period and any mistakes in the program could be corrected

REGISTRATION FOR EXAMINATION

In order that the committee on requirements may appraise carefully the qualifications of candidates, application must be made on a special blank, which may be obtained from the secretary No application will be considered unless made on the regular application blank Applications should be filed early in order to obtain full advantage of the sets of histopathologic slides which are available through the Army Medical Museum in Washington The completed application blank should be sent several months before the date of examination, to the secretary of the board together with the required reprints photographs and a *registration* fee of $25 which will not be refunded under any circumstances No application will be considered until this fee is received An *examination* fee of $75 is payable when the candidate is notified that his application is acceptable to the board The fee of $100 has been carefully computed and is used entirely for administrative purposes Examiners for the board do not receive any compensation except for actual expenses connected with holding the examinations

Make checks payable to American Board of Dermatology and Syphilology Inc

EXAMINATIONS

All applicants classified are required to take and pass a written examination before they are eligible for the oral test The written examination on clinical, basic science and laboratory subjects will be held simultaneously at stated intervals in different parts of the country, approximately two months before the oral examination

The present policy of the board is to test the knowledge of a candidate by means of the so-called multiple choice written examination in place of the essay type examination which was formerly in vogue

All applicants are also required to pass an oral, clinical and laboratory examination This examination will be conducted in a clinic, hospital ward or other suitable location where clinical dermatology will be discussed with each candidate, as well as various subjects related to the skin such as histopathology, mycology, allergy and physics of physical therapy The board reserves the right to add to this list other subjects within the field of dermatology and syphilology

A candidate for a certificate may take his examination the next time it is given after he has completed three full years of training in the specialty, provided he makes application before the quota for that session is filled, this provision does not affect the regulations about the issuance of the certificate (See Certificates)

Examinations are designed to test the candidate's fitness to practice dermatology and syphilology as a specialty The board will try especially to ascertain the breadth of his knowledge in the basic, as well as the clinical aspects of cutaneous medicine, to test his familiarity with the recent literature of dermatology and syphilology and to ascertain his general qualifications as a specialist in this branch of medicine

Whenever an applicant fails to pass the examination, the board, if requested, will make suggestions regarding further training for the purpose of overcoming deficiencies in the applicant's knowledge of this specialty

Candidates who have signified their intention of taking the examination and who fail to appear at the scheduled time or who attempt to cancel their appointment after the sending of the final notice, shall forfeit the fee for the examination

Except in special circumstances, applicants shall take the examination within the year following the filing of application and the deposit of the fee

The oral examination has been held twice during each of the last three years From present indications the number of students has decreased sufficiently so that only one examination each year may be given

REEXAMINATIONS

If the candidate fails or is conditioned in an examination he will be automatically admitted to a second examination and must give at least sixty days' written notice of his intention to appear for reexamination His acceptance for a particular examination is dependent on the number of candidates already on the roster If a candidate who has failed or has been conditioned does not appear for reexamination before the expiration of three years, he will be required to make a new application and pay an additional fee of $75 before reexamination

A candidate who has failed twice must file a new application and pay an additional fee of $75

CERTIFICATES

A certificate will not be issued until the successful candidate has completed at least five years of dermatologic training and experience The granting of this certificate by the board indicates that the holder of the certificate has had adequate training in dermatology and syphilology and has successfully fulfilled the requirements of the board

A certificate granted by this board does not of itself confer or purport to confer any degree or legal qualifications, privileges or license to practice dermatology or syphilology The board does not intend to limit or interfere with the professional activity of any duly licensed physician Its aim is to improve the standards of practice of dermatology and syphilology by encouraging improvement in the opportunities for and quality of training for specialists in this field of medicine, and to certify as specialists those who voluntarily comply with the requirements of the board

Certificates will be issued only to physicians in the United States and its possessions, in Canada and in Cuba

ADVERTISING

It is not considered good form for a diplomate to advertise to the lay public the board's recognition of his training and ability He should not use commercial methods or avenues It is proper to include a statement or phrase such as "Diplomate of the American Board of Dermatology and Syphilology" in sending out announcement cards when opening an office or in inserts after the author's name in a medical publication when the association with a hospital, medical school, or medical society is also mentioned If the diplomate is in doubt, it would be well to consult the board before placing his good name in jeopardy

CREDIT FOR MILITARY SERVICE

1 All students in training who had served in the Army, the Navy, or the Public Health Service should complete a supplementary application form, obtainable from the secretary, in order to have evaluated the credits to which they are entitled Since the amount of credit to be allowed must be agreed to by various members of a committee, and since these members live in different, often widely separated cities, several months are usually required before a decision can be rendered The student is then sent a written report

2 Full time dermatologic military service may be credited, at the discretion of the board, for part or in exceptional cases all of two years of the three required years of *training* But at least one of the three years' required training to include instruction in the fundamental subjects deemed essential for an adequate dermatologic education, must be spent in one of the institutions approved for a three year training program by the board and by the Council on Medical Education and Hospitals of the American Medical Association

3 The board strongly urges that the candidate supplement his military experiences by a further period of systematic and supervised dermatologic training before the examination.

4 A credit of one year as *experience* has already been voted by the board for one year of any medical service with the armed forces Thus a former medical officer who passes the examination at the end of three years of training will receive his certificate one year later instead of at the completion of a total of five years' training and experience Dermatologic work while in the armed forces not credited as training, may satisfy part or all of the remaining year of required dermatologic experience

INSTRUCTIONS TO APPLICANTS

Fill out application blank in detail

Enclose fee of $25 Make checks payable to the American Board of Dermatology and Syphilology

Include photographs autographed across the front as directed on application blank

Enclose reprint of each published paper, if possible

Send completed applications and above items to the secretary

Please indicate under No 13 on the application blank as complete data as possible about your training in dermatology and syphilology Indicate the month and year, if possible, or at least the number of months of the various parts of your training and also whether full time or part time If part time, indicate whether one half day, six days a week, or three days a week, and so on If dispensary service is considered as part of the training, please indicate details here as well as under No 14

In No 16 indicate clearly when you began to limit your practice to dermatology and syphilology

If your training and your practice overlap, please explain under No 19

PUBLICATIONS OF THE BOARD

1 Booklet of Information

2 Opportunities for graduate and postgraduate students in dermatology and syphilology, containing a list of loci where instruction may be obtained, and details about these places. A check or money order for $1 should accompany request for a copy

3 Syllabus of Graduate Training
- (*a*) To inform the student physician, intending to specialize, of the field to be covered in his preparation and the methods by which his preparation can be accomplished
- (*b*) To aid the medical schools and the dermatologic departments of medical schools and hospitals by outlining the scope of teaching deemed advisable for specialization in dermatology and syphilology

RESPONSIBILITES

The major object of the board is to pass judgment on the competence of internists who desire certification not to determine who shall or shall not practice internal medicine as a specialty

The American Board of Internal Medicine is not concerned with any mechanism which gains special privileges or specific recognition for those physicians who have been certified in internal medicine It has never been the intent of the board to define requirements for membership on the staffs of hospitals

The board endorses completely the stand of the American Board of Surgery which 'specifically disclaims interest in or recognition of differential emoluments that may be based on certification "

REQUIREMENTS FOR ADMISSION TO EXAMINATION AND CERTIFICATION

Each applicant for certification by this board must satisfy the qualifications listed below (I) General Qualifications A B C D (II) Professional Qualifications A B C D For exceptions to the requirements C and D under Professional Qualification see paragraph G

I General Qualifications

A All candidates must be citizens of the United States or Canada

B All candidates must present evidence of satisfactory moral and ethical standing in the medical profession

C All candidates must be active members in good standing in their county and state medical societies in their state of legal residence Under unusual and exceptional circumstances the board reserves the privilege of modifying this requirement. (This ruling shall not apply to commissionad officers of the United States regular Army or Navy or Public Health Service or to full time staff members [physicians] of the Veterans Administration who are otherwise Service Fellows of the American Medical Association)

D Canadian citizens must be active members of the Canadian Medical Association before admission to examination

II Professional Qualifications

A Graduation from a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association at the date of graduation

B Satisfactory completion of an approved internship of not less than twelve months [1]

C Residency or fellowship approved by the Council on Medical Education and Hospitals of the American Medical Association in internal medicine according to the following plan (Plan A) or one of the alternate plans described under paragraph D

Plan A A residency or fellowship in internal medicine for a period of not less than three years in a hospital or other institution approved by the Council on Medical Education and Hospitals of the American Medical Association for residency or fellowship in internal medicine In such instances in which a resident's nominal status differs from that of the other hospital residents, he must furnish the board with certification by the chief of the medical service and the medical director of the hospital that he actually performed the full duties of a resident as a bona fide member of the residency program In addition, two years of practice of clinical internal medicine will be required The board will accept the following equivalents as satisfying one year only of the three years of residency or fellowship to which this paragraph refers (Two years must be in the field of general internal medicine)

1 If twelve months of a two year approved internship in a hospital approved for residency training in internal medicine is limited to the medical service and medical specialties credit will be granted for a first year of assistant residency The remaining two years of residency training must be in the general field of internal medicine Certification by the chief of the medical service as to compliance with this requirement must accompany application

2 One year of approved residency in one of the medical specialties allergy, cardiovascular disease, gastroentero'ogy, hematology, pulmonary diseases, neurology, pediatrics, psychiatry, dermatology and syphilology

3 One year of approved residency in pathology

4 One year as a graduate student or as an instructor in an approved medical school on a full time basis in bacteriology, biochemistry, pathology, pharmacology, physiology or internal medicine

5 An advanced degree in the fundamental sciences

Note —Graduate training credit for the time involved will be allowed candidates who take and satisfactorily complete postgraduate courses in internal medicine or the basic medical sciences provided by accredited medical schools on a full time basis This ruling shall not apply to courses of less than three months' or more than twelve months' duration A certificate of creditable performance, based in part, at least, on a formal examination on completion of the course, will be required

Note.—Fellowship or research assignments not approved by the Council on Medical Education and Hospitals will require certification by the chief of service that such assignment was equivalent in graduate training opportunities and patient responsibilities to that of an approved residency in internal medicine or the subspecialties recognized by the board This certification must be presented before application is filed

D Alternate Training Plans The board firmly believes that the plan of intensive training prescribed above offers the best opportunity for a young physician to prepare himself to meet his responsibilities as a specialist in internal medicine It is recognized however that capable individuals may accomplish the same result in a longer period of time during which the training is less intensive The board realizes that a number of medical graduates cannot follow the shorter and more desirable plan either because suitable residencies are not available or, in some instances because of personal and economic reasons Accordingly the board has modified its previous regulations governing eligibility for admission to examination In doing so the board has not modified its standards of examination It has liberalized its eligibility requirements for admission to examination by accepting half time formal training and the practice of internal medicine under favorable circumstances as to professional and hospital contacts, in lieu of part of the full time requirements It is hoped that by this means exceptional individuals may acquire a knowledge of medicine and experience in its application sufficient to qualify for examination

---

[1] During the period in which the 9-9-9 program was in effect an approved internship of nine months will satisfy the requirement of twelve months. A residency of nine months is considered as nine months only

The program previously described (Plan A), which consists of three years of formal training in an approved residency or its equivalent, following internship, and two additional years in the practice of internal medicine, is recommended by the board Variations in this program are now subject to the following regulations

1 In all instances one year of approved internship and one year of approved residency will be required, except as indicated under Plan G The graduate training credit of one year heretofore granted as a result of active duty as a commissioned officer in the armed forces during the period beginning Dec 7, 1941 and ending Jan 1, 1947 may not be applied in satisfaction of the one year of approved residency referred to in Plan D, E, or F unless the candidate s assignment is considered by the board to have been equivalent to an approved residency

2 Following one year of internship and two years of approved residency [2] the remaining requirements may be satisfied by

Plan B, that is, by two years of half time formal training followed by two years of practice limited to internal medicine, or by

Plan C, that is, by five years of practice limited to internal medicine

3 Following one year internship and one year of approved residency, the remaining requirements may be satisfied by

Plan D [3], that is, by four years of half time formal training followed by two years of practice limited to internal medicine or by

Plan E [3], that is, by two years of half time formal training followed by five years of practice limited to internal medicine, or by

Plan F, that is, by eight years of practice limited to internal medicine

4 In every instance at least two years of practice in internal medicine must be included, but in instances in which four years of practice are substituted for one year of residency, only one additional year of practice will be required, when more than eight years of practice are substituted for two years of residency an additional year of practice will not be required

5 Physicians who have practiced internal medicine for twelve years following an approved internship may qualify for the examinations without further training (Plan G)

Half time formal training under expanded plans B, D and E is defined as follows

1. Half-time [3] as an instructor in clinical medicine in a recognized medical school in the United States or Canada
2. Half-time [3] in a research fellowship sponsored by a recognized medical school in the United States or Canada
3. Half time [3] as a graduate student in an approved graduate medical school in the United States or Canada

E Practice Requirements A period of not less than two years of practice in the general field of clinical internal medicine or in the more specialized branches of medicine (See exceptions, Section D paragraph 4) This requirement may be satisfied by independent practice or in association with a recognized internist

NOTE —Although in general the board believes it desirable to complete the three years of formal training before satisfying the requirements of practice, a reversal of this order is acceptable

F Graduates of Foreign Schools At the present time neither the Council on Medical Education and Hospitals of the American Medical Association nor any other educational agency in the United States has the facilities to evaluate adequately the quality of foreign medical education This board must, therefore, evaluate the fundamental educational credentials and other qualifications of each individual candidate educated abroad who applies for admission to examination (Requirements for graduates of foreign schools may be obtained on request to the board—One West Main Street, Madison 3, Wis)

G Candidates Graduating Prior to 1937 The requirement of three years of graduate training will not apply to candidates graduating from approved medical schools in the United States and Canada in 1936 or previous thereto, provided such candidates have limited their work to the field of internal medicine for at least two years, and provided each candidate is recognized as an internist by his colleagues in his community

H "Preceptor Training' Preceptor type training is not recognized in satisfaction of any part of the three year requirement of formal graduate training

I The board will grant one year of graduate training credit, or one year in satisfaction of the requirements of practice, regardless of assignment, for active duty as a commissioned officer in the United States Army, Navy or Public health Service for one year or more, beginning on or subsequent to Dec 7, 1941 and terminating on or before Jan 1, 1947 Commissioned officers serving less than one year prior to Jan 1, 1947 may apply that interval as graduate training, or in partial satisfaction of the requirements of practice This ruling applies to those who served during World War II

Service credit, either graduate training or practice, beyond one year requires individual evaluation by the Credentials Committee During the present emergency and beginning June 1, 1950, the board will grant one year of graduate training credit or one year in practice satisfaction of the requirements of practice regardless of assignment for active duty in the armed forces

PRINCIPLES OF TRAINING

The American Board of Internal Medicine is interested in the fact that the candidate has embarked on a career of study voluntarily and has thereby expressed the desire to excel and to participate personally in the world's progress in medicine

Preparation must be based on years of continuous thoughtful study Therefore, in suggesting a program for those who wish advice, the board hopes to assist the candidates to avoid inferior and superficial programs which may lead to failure and disappointment in later years

The board believes that all internists should have a sound fundamental knowledge of anatomy, bacteriology, biochemistry, pathology, pharmacology and physiology Such knowledge is essential to the continued progress of any internist The board anticipates that adequate training will be obtained in the basic sciences as applied to internal medicine during a formal three year residency program

The board wishes to emphasize that time and training are but a means to the end of acquiring a broad knowledge of internal medicine which the candidate must demonstrate to the board in order to justify it in certifying that he is competent to practice internal medicine as a specialty The responsibility of acquiring the knowledge rests with the candidate The responsibility of maintaining the standards of knowledge required for certification rests with the board

APPLICATION

Candidates for examination must make their application on a prescribed form, which may be obtained from the office of the Executive Secretary Treasurer

The application must contain a record of the candidate s premedical and medical training as well as of internships, residencies, graduate study hospital or dispensary staff appointments, teaching positions, service in the armed forces, membership in medical societies medical papers published and the names of four well known internists to whom the board may write for professional and character reference

The application must be accompanied by one recent, signed photograph of the candidate mounted on the application, and the registration and examination fee of $40, which fee will cover both the written and oral examinations An additional fee of $10 will be required when the certificate is issued

---

[2] For the second year of approved residency one of the equivalents described under C Professional Qualifications may be substituted

[3] Half time formal training is regarded as four hours per day for six days per week It is required that half time formal training be verified by the head of the department Verification must accompany application.

The requirements of graduate training and two years of practice in the field of internal medicine must be satisfactory before a candidate is eligible to apply for admission

METHOD OF EXAMINATION—WRITTEN AND ORAL

The examinations for certification by the board comprise two parts Part I is written, Part II is clinical and is an oral examination The written examination is held simultaneously in different sections of the United States and Canada Effective Jan 1, 1949, one written examination will be given each year This examination will be held on the third Monday in October This examination is divided into a morning and afternoon period for each of which three hours are allowed The questions are of the multiple choice type, framed in such a manner as the board elects and designed to test the applicant s knowledge of applied physiology, anatomy, physiological chemistry, pathology, bacteriology and pharmacology as related to internal medicine, and his basic clinical acumen

Candidates must pass the written examination before admission to the oral examination will be authorized The oral examination is conducted under the direct supervision of the board It is held near the time and place of the annual meetings of the American Medical Association and the American College of Physicians The examination is conducted at the bedside of the patient Each candidate is assigned two or more patients and is expected to be sufficiently familiar with whatever problems present themselves to satisfy the board of his clinical expertness

Normally only two oral examinations are given each year The board may, however, schedule special oral examinations if necessary Announcement of all examinations will appear in the *Annals of Internal Medicine* and THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION Applications cannot be accepted until the schedule is announced in the publication referred to, and cannot be accepted after the closing date as announced

REEXAMINATION—WRITTEN AND ORAL

1 Effective July 1, 1949, the board will waive restrictions on the number of written examinations authorized provided the candidate has satisfied the requirements hereinafter set forth in paragraph 4 The board may at its discretion deny reexamination in individual cases The interval between the first and second written examinations will be one year The interval between all subsequent written examinations will be two years A longer period may be required by the board A fee of $10 is required for each additional written examination

2 Effective July 1, 1949 the board will waive restrictions on the number of oral examinations authorized, provided the candidate has satisfied the requirements hereinafter set forth in paragraph 4 The board may at its discretion deny reexamination in individual cases The interval between the first and second oral examinations will be one year The interval between the second and third oral examinations will be not less than two years The interval between all subsequent oral examinations will not be less than three years A longer period may be required by the board A fee of $20 is required for each additional oral examination

3 This ruling does not make it mandatory for a candidate to repeat the examination within the specified time limit Candidate may elect a longer interval in the case of both the written and oral examinations

4 When applying for reexamination a candidate who has been unsuccessful in three written or three oral examinations will be required to present evidence that he has completed additional graduate training of at least three months in internal medicine in an approved medical school on a full time basis or its equivalent in approved resident or fellowship training since the last examination In individual cases the board may require a longer course Short courses of less than three months may not be applied in satisfaction of this requirement A new application for admission is required

The provisions of this section shall be effective retroactively Any candidate previously disqualified from further examination on the basis of having been unsuccessful in three examinations either written or oral may now apply for reexamination subject to the provisions of paragraphs 1 through 4 of this section

CANCELLATIONS

Effective July 1, 1949, any candidate who cancels his assignment for a written or an oral examination after the official cards of admission have been mailed, will be required to pay a special fee in the amount of $10 before a subsequent examination, unless his cancellation was due to a cause deemed adequate by the board to exempt him from such special fee The mailing date of the cards of admission will be approximately one month previous to the date of examination This provision becomes necessary because of the large number of cancellations after complete arrangements have been made, and the expense incident thereto

CERTIFICATES

The certificate issued by the American Board of Internal Medicine shall be in such form as to comply with the articles of incorporation and the by laws and shall be signed by the officers and members of the board and shall bear the official seal of the board

Certificates of the board will be issued to candidate who have satisfactorily completed the written and oral examinations and have been found qualified by the board to practice the specialty of internal medicine Specialty certification will be designated on the certificate, for those so certified

SUBSPECIALTY BOARDS

Allergy cardiovascular disease gastroenterology and pulmonary diseases are recognized specialties

Each subspecialty application is individually considered and acted on by the subspecialty board concerned The candidate is not eligible for examination until his application has been approved by the subspecialty board concerned and confirmed by this board

All candidates must pass the written and oral examinations in internal medicine before admission to examination in a specialty of medicine referred to The specialty examinations are oral only and may be taken at any regularly scheduled oral examination subsequent to the candidate s certification in general medicine Announcements of the oral examination will appear in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION and the *Annals of Internal Medicine*

Application forms will be forwarded on request to the office of the Executive Secretary-Treasurer and should be returned to his office when completed

INFORMATION ON CERTIFICATION IN ALLERGY BY THE AMERICAN BOARD OF INTERNAL MEDICINE

1 Two years, full time, in an approved allergy clinic and hospital (including training both in Allergy and Internal Medicine or Pediatrics) or

2 One year, full time, in an approved allergy clinic and hospital and two additional years of attendance at an allergy clinic and its activities, or

3 Five years, full attendance at an approved allergy clinic and its activities

Approval is granted solely by the Council on Medical Education and Hospitals of the American Medical Association

The Director or Chief of the Allergy Clinic must be certified in Allergy by the American Board of Internal Medicine or the American Board of Pediatrics Inc

INFORMATION ON CERTIFICATION IN CARDIOVASCULAR DISEASE BY THE AMERICAN BOARD OF INTERNAL MEDICINE

The applicant should be of good character and excellent standing in his community, as attested by letters from sponsors of known integrity The committee has disapproved applications from men whose training and achievements have seemed otherwise acceptable but who have been regarded by their colleagues as unethical or otherwise undesirable influences in their communities

The applicant should have reached a state of maturity, compatible with the acquisition of sufficient factual knowledge and experience to form a basis for sound judgment The committee believes that it is only unusual individuals who are sufficiently mature for this subspecialty before the age of thirty-five years or less than ten years after graduation from medical school

The candidate must have given clear evidence of his deep and constant interest in cardiovascular disease over a period of years The committee is particularly interested in recommending for examination those applicants whose records indicate that their interest in cardiovascular disease will probably *be sustained throughout life, and that their knowledge of the* subject will constantly grow Achievements in the field of research are regarded as evidence of such interest but publication of articles or prolonged training in research work is not considered essential Consideration will be given to the circumstances of each applicant's training and experience, those who have been in communities and institutions which offered excellent opportunities for contributions to the knowledge of cardiovascular disease will be expected to have made such contributions Consideration will be given to the difference in experience of those whose opportunities for research have been more limited

In most cases it is deemed essential that the candidate after thorough training in internal medicine shall have received at least one full year of postgraduate education in cardiovascular disease, *preferably under the guidance of a person known to be* experienced and sound

Every candidate admitted to the certifying examinations in cardiovascular disease will be expected to possess specialized knowledge of the kind indicated below This list is by no means complete it is intended to indicate the nature rather than the extent, of the knowledge every applicant should have In terms of its scope it should be regarded as the minimum, not the maximum

Full and accurate knowledge of the anatomy of the normal and diseased heart including its relationships to the external chest and to the other mediastinal structures A comprehensive anatomical knowledge of all important blood vessels including their aberrant locations

A thorough knowledge of the normal and pathological physiology of the heart and peripheral circulation is considered by the committee to be of fundamental importance

Detailed knowledge of the diagnostic signs which permit the recognition of all important diseases of the heart and blood vessels such as arteriosclerosis, arteriosclerotic heart disease, syphilitic heart disease, rheumatic heart disease, constrictive pericarditis auricular and ventricular septal defects, coronary thrombosis with myocardial infarction, thromboangitis obliterans, Raynaud s syndrome, coarctation of the aorta, aneurysm, patent ductus arteriosus, periarteritis nodosa and lymphedema

Familiarity with the special methods used in the study of diseases of the heart and blood vessels In the case of the heart, these include such technics as electrocardiography and roentgenography, in the case of vascular diseases, such technics as the use of the oscillometer and thermocouple, arteriography, and venography, reflex vasodilatation, the cold pressor test, color changes with elevation, dependency and temperature

Accurate knowledge of the pathologic changes associated with the more important diseases of the heart and blood vessels, sufficient to enab'e the candidate correctly to evaluate the pathologic condition *from gross specimens of microscopic* sections

Fairly extensive and detailed knowledge of the pharmacology relating to heart and blood vessels This must include full knowledge of the important relationship of the autonomic nervous system both to the heart and to the peripheral vessels, and the effects of stimulation or paralysis of the various parts of the autonomic system by drugs or by surgical methods The candidate should be intimately familiar with the use and effects of such important drugs as digitalis, quinidine, heparin, papaverine, epinephrine, dicumarol, penicillin, diuretics and sedatives

Every candidate should have a sound understanding of the indications for conservative therapy, as well as for surgical procedures, in cardiac and peripheral vascular diseases (patency of the ductus arteriosus, arteriovenous anastomoses, constrictive pericarditis, scalenus anticus syndrome)

INFORMATION ON CERTIFICATION IN GASTROENTEROLOGY BY THE AMERICAN BOARD OF INTERNAL MEDICINE

A Professional Standing

The candidate must have at least two letters from recognized internists or gastroenterologists, which must attest to the candidate's professional qualifications and ethical standing, whether he is specializing in gastroenterology and if not entirely, giving an opinion as to approximately how much of his work is devoted to it

B Education

1 The candidate must admit proof of adequately supervised training in the recognized gastroenterologic procedures, including gastric and hepatobiliary function tests, proctosigmoidoscopy and gastrointestinal roentgenology (film interpretation)

2 The candidate must present evidence of fulfilment of one of the following requirements

(*a*) Formal graduate course in gastroenterology, full time for at lease eight months in a recognized institution

(*b*) Residency or fellowship for at least one year in gastroenterology under tutelage of a recognized specialist

(*c*) In the absence of (*a*) and (*b*), attendance and active participation in a ward service or in a gastrointestinal clinic, recognized in standing, for at least five years

3 If requirements (*a*) or (*b*) under the above heading have been met, only three years of (*c*) will be required

C Practice

At least 60 per cent of the candidate's work must have been devoted to gastroenterology for at least three years before application

INFORMATION ON CERTIFICATION IN PULMONARY DISEASES BY THE AMERICAN BOARD OF INTERNAL MEDICINE

I Candidates for certification in pulmonary diseases shall fulfil the requirements of the American Board of Internal Medicine as to

A General Qualifications

B Professional education

C Special training

II In Addition to the General Requirements of the American Board of Internal Medicine, candidates shall

A Have completed special training period in pulmonary diseases to include at least a year's work in a sanatorium or hosp tal *for tuberculosis and at least another year in the practice* of pulmonary diseases in such an institution or in association with an older man competent in this field

B Submit an application to the Advisory Board in this specialty, which must be approved by all of the members of this board

C Pass the written and oral examinations of the American Board of Internal Medicine

D Pass the oral and practical examination in pulmonary diseases

AMERICAN BOARD OF NEUROLOGICAL SURGERY

A W Adson, Chairman, Rochester, Minn
Francis C Grant, Vice Chairman, Philadelphia.
Percival Bailey, Ch cago
Howard A Brown, San Francisco
Leo M Davidoff, New York
Leonard T Furlow, St Louis
Eric Oldberg, Chicago
Bronson S Ray, New York
R Glen Spurling, Louisville
James C White, Boston
Harry Wilkins, Oklahoma City
William J German, Secretary-Treasurer, 789 Howard Avenue, New Haven 4, Conn

General Qualifications

1 Moral and ethical standing in the profession satisfactory to the board of directors

2 *It shall be discretionary* with the board to accept for examination candidates who have been in practice more than six years but whose formal training fails 'o meet the full requirements

3 Properly qualified candidates who are permanent residents in and citizens of other countries and are *legally qualified* to practice medicine there, and who have received their training in neurological surgery in the United States of America or Canada may apply for certification by the American Board of Neurological Surgery

PRELIMINARY PROFESSIONAL STANDING

1 Graduation from a medical school which is acceptable to the American Board of Neurological Surgery

2 Completion of a surgical internship of not less than one year in a hospital acceptable to the board, or its equivalent in the opinion of the board (A one year rotating internship does not satisfy this requirement)

SPECIAL TRAINING

A period of graduate study in a recognized graduate school of medicine of not less than three years beyond the year of general surgical training, or in an approved hospital or under a sponsorship acceptable to the American Board of Neurological Surgery for the training of neurological surgeons The training in clinical neurological surgery must be progressive and not obtained during repeated short periods in a number of institutions It is preferable that at least two years of this training be had in one institution, and the board will not ordinarily approve periods of training in clinical neurological surgery of less than one year

This period of special training shall be of such a character that the relation of the basic sciences of anatomy, physiology, pathology, bacteriology and biochemistry is emphasized Knowledge of these sciences as applied to practice of neurological surgery will be required in the examination The board will not credit periods of study limited to these basic sciences of longer than six months in fulfillment of this requirement of three years of special training

Training in diagnostic neurology should be obtained either in correlation with training in neurological surgery or independently The candidate will be required to pass an examination in this subject

An additional period of not less than two years in the practice of neurological surgery

The above represents only the minimum requirements of training for the practice of neurological surgery in the opinion of the board

APPLICATIONS

An application on the official application blank in such form as may be adopted from time to time by the Board of Directors, in order to be considered at any meeting, must be in the hands of the secretary treasurer of the board not less than sixty days before the date of such meeting

The secretary treasurer of the board on receipt of an application shall forthwith make inquiries from those to whom the candidate refers and from such other persons as the secretary-treasurer may deem desirable, after which he shall forward the application to the Committee on Credentials This committee shall consider the application and other information available and notify the secretary treasurer its recommendation whether or not the applicant is acceptable The certification of a candidate shall be approved by a majority of the members of the entire board at any meeting held for such certification

PAYMENT OF FEES

The fee for certification, with or without examination, shall be $100

The candidate for examination on filing his application shall accompany it with an application fee of $25 When notified by the secretary treasurer that he is eligible for examination he shall send the examination fee of $75 to the secretary treasurer at least two weeks before the date of the examination The application fee will be returned if the candidate is not accepted for examination

REEXAMINATION

A candidate who has failed in one examination is eligible for reexamination in the subject or subjects in which he failed within three years on payment of a reexamination fee of $25 A candidate who has failed in one examination and who does not apply for reexamination within three years or a person who has applied within that time but who has failed a second time will be considered a new applicant

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY

WALTER T DANNREUTHER President New York
JOSEPH L BAER, Vice President Chicago
WILLARD R COOKE, Vice President, Galveston, Texas
F BAYARD CARTER, Durham N C
ROBERT A KIMBROUGH JR , Philadelphia
DANIEL G MORTON, Los Angeles
LAWRENCE M RANDALL, Rochester, Minn
HERBERT E SCHMITZ, M D Chicago
ROBERT L FAULKNER, Secretary-Treasurer 2105 Adelbert Road 6, Cleveland

REQUIREMENTS

Each applicant before he may become eligible to receive the certificate of the board or other evidence of recognition

1 Must have had conferred on him a degree in medicine by an institution of learning approved by the Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association

2 Must establish in a manner satisfactory to the Board of Directors that he is a physician duly licensed to practice medicine, and

(*a*) that he is of high ethical and professional standing

(*b*) that he has received at least minimal training bilaterally, i e , in both obstetrics and gynecology Training in one branch only is no longer sufficient for qualification The term minimal training as used here is at present defined as meaning at least one year of full time formal training, in the branch of either obstetrics or gynecology relegated to a minor role in a candidate s training program as related to his preference and plans for practice The required total of formal training is three years

(*c*) that physicians otherwise qualified, who were graduated before Jan 1, 1939 and whose required training was in obstetrics or gynecology alone, and who have confined their practice to obstetrics or gynecology for at least five years immediately prior to application be accepted for examination as candidates for certification in either obstetrics or gynecology In all other respects requirements for eligibility remain the same as for those physicians graduated since 1939 Bilateral training is required

3 Must make application for investigation of his credentials and a survey of his character

4 Must assure the board that he is limiting his practice to obstetrics and/or gynecology and that he intends to continue to do so, except for possible military duties Candidates will be accepted only if, on application or by the time of their examination, they have been in practice limited to the specialty for a minimal period of at least two years following completion of their specialty training This change in requirements permits a qualified candidate to make his application in the second year of his post training practice period The sole exception to the two year limitation is practice for the Frontier Nursing Service, Inc , of Kentucky

This board will not accept applicants for examination who are not full citizens of the United States or of Canada, though they be residents of either country Foreign born applicants must have been certified by either the National Board of Medical Examiners or licensed to practice medicine in the United States or Canada by a state or provincial board of licensure Notarized statements, not original citizenship papers, must be furnished when the application is filed attesting to the fact of full citizenship in the United States or Canada if the applicant is foreign born Further, there will be required a probationary period of at least three years from the date of licensure in the practice of medicine in these countries before such a candidate may be admitted to examination

Applicants who have been certified by one of the other American specialty examining boards will not be eligible for certification by this board until they have relinquished the certificate previously conferred (In making application to this board for certification, applicants, for some time back *have* agreed to revocation of their certification by this board if and when they apply for and receive certification by any other American board, except on special action to the contrary taken by the American Board of Obstetrics and Gynecology)

The board has ruled that physicians who accept male patients in their private or other practice, for operative or other care, cannot be regarded as specialists in obstetrics and gynecology, except by special ruling when this is related to active military duty

This board deprecates engagement in fields of practice other than that in which candidates profess to be specialists The board does not exclude from examination, however, obstetricians-gynecologists who practice abdominal surgery and urology in the female because of the correlation of these activities Breast surgery, hernia operations gallbladder surgery and appendectomies *per se* are general surgical conditions

Military service or any other similar patriotic service, such as work with Selective Service boards, have not been construed as nonlimitation of practice in violation of the board regulations Officers (Regulars or Reserves) certified by this board and on duty with 'Family Dependent Services" are expected to be permitted to limit their work to the specialty, as in civilian life, and not to be engaged regularly in general or other practice

The minimal requirements for all candidates will be uniform as follows

1 Completion of at least one year intern service in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association This need not be a general rotating internship, although this latter is preferred

The board accepts the fifth or intern" medical school year required at some schools in lieu of the usual fifth or intern clinical training' year following graduation

2 A minimum of seven years of training and practice after the intern year, to include at least three years of residency training in obststrics gynecology in approved institutions, or adequate preceptorship training (See Section on Preceptorship Training) Following completion of acceptable training two years of post training practice limited to the specialty are required

This leaves two other years in the total of eight years following graduation During the early part of this period other training in branches, especially such as general abdominal surgery (see next paragraph), or in pathology, urology, internal medicine, or general practice is desirable and accredited on this total time period The last two years of such an eight year period must be in practice limited to the specialty (See paragraph 4 under Requirements)

The Council on Medical Education and Hospitals of the American Medical Association listed for the first time in 1950 (J A M A April 15 1950 pages 1216, 1204-1211) 149 inspected and approved one year residencies in general surgery as offering training in general surgery in preparation for residencies in surgical specialties ' Such residencies are recommended by this board as desirable additional preparation, particularly when they provide opportunities for training in abdominal surgery As noted above, such service may be included in the total minimal eight years required after graduation

Post-training practice period may include full time medical school or other positions within the specialty, actual practice within the specialty as an assistant, associate or independently

Periods of residency in obstetrics gynecology in excess of the required three years will not be accepted as a substitute for any part of the two required years of post training practice except in the cases of *men advancing from their* residency training into and planning to remain in full time teaching positions in medical schools and their affiliated hospitals

3 Basic science training should emphasize the relation of the basic sciences, anatomy, pathology, physiology, biochemistry and bacteriology, to the application of surgical principles which are fundamental in all branches of surgery More especially, for this specialty there should be training in infertility, endocrinology oncology, irradiation therapy, electrotherapy, psychosomatic medicine and other nonoperative methods of diagnosis and treatment In addition, the candidate must understand and be trained in the care of emergencies, shock, hemorrhage blood replacement *electrolyte and fluid* balance protein and nitrogen balance, choice of anesthetics, chemotherapy, acidosis and alkalosis, narcotics and hypnotics, wound healing, and so on

Studies in the basic sciences may be integrated with the clinical work or may be given separately

SPECIAL CREDITS AND RULINGS

The board conformed with the general acceleration in programs in medical education in that it will accept a period of nine accelerated' months as an academic year in satisfying the requirement for each of three years of residency training Such allowances can be made only for services during the wartime period of the official 'accelerated program" and are not made for services before 1943 or after the discontinuance of this acceleration in 1946

No formal graduate courses are required If taken, credit will be limited to six months Fellowships will be evaluated individually for credits by the Credentials Committee

An applicant serving under military orders in an Army or a Navy hospital in an obstetrical gynecological service under supervision will be given the same credit as if he were working under a preceptor, if these departments are supervised by diplomates of this board or recognized obstetricians gynecologists. He may obtain *full residency credit if such hospital is officially* approved and listed for residency training *in this* specialty The Credentials Committee of the board will review and give consideration to each individual case Special request must be made for such credits

A blank log-book entitled 'Medical Officers Professional Training Record is obtainable from the offices of the Surgeons General *This Record should be carefully kept and attested while in military service*

APPLICATION AND FEES

Application must be made on a special blank which will be furnished by the secretary's office and must be forwarded with the other required credentials and the application fee to the secretary's office at least ninety days prior to the scheduled date of the Part I examinations

Candidates who have not had a minimum of three years' formal residency type of special training should utilize Preceptorship or Supplemental Training forms, obtainable from the office of the board, to submit in addition to the regular application form

The application fee is *$25 and is not returnable*

The examination fee is $100 and is payable when the candidate is notified of acceptance for examination This fee is not returnable after the candidate has been officially accepted by the Credentials Committee and notified to report for examination.

If the candidate fails the Part II examination on his original application he may exercise the privilege of one reexamination (see Examinations, Part II) but he will be required to pay a fee *of $25 for such reexamination on making request that his application be reopened for this purpose This ruling is* effective on *applications originally made* after June 1, 1949

The fees have been carefully computed on a basis of cost of examinations and are used entirely for administrative expenses. Examiners and associate examiners serve as such without compensation other than actual expenses

Many prospective candidates write the secretary s office outlining in their letters their training qualifications and asking informally if they are eligible if this training has been *sufficient* and, if not, what is still lacking Any candidate should be able to make a fair estimate of his eligibility after studying these *requirements*

Individual officers and directors cannot and will not make any such estimates or rulings These are made only by the Credentials Committee after reviewing such requests made on a *special* form provided for this purpose and submitted to the *secretary for an* appraisal with the fee of $15 to cover clerical expenses *involved.*

This form is designated the "Application *for Appraisal of* Incomplete Training '

Personal interviews *cannot be granted by the secretary or other directors of the board* unless requested by the board

Appraisal of Training forms should not be filed if Application for Certification has already *been filed This is unnecessary* duplication

All candidates must comply with the board regulations in effect for the year in which the examination is taken, regardless of when the original application was filed

Applicants declared ineligible for admission to examination may request reopening of their applications within two years of the filing date without payment of an additional application fee When a candidate requests that his application be reopened, he must supply the board with information to justify such further consideration A request for the reopening of an application declared ineligible by reason of insufficient training nonlimitation of practice or similar items may not be approved in less than two years, although application may be made as specified above to avoid payment of an additional fee This approval time may be reduced under exceptional circumstances The request must have adequate supporting evidence of additional training and experience to warrant reconsideration Preceptorship or Supplemental Training blanks should be used for such reports and these will be supplied on request

After two ineligibility or postponement rulings on any candidate's application an entirely new application must be submitted (with or without fee, according to current requirements) in order to bring data down to date The essential feature of this should be evidence of additional training and experience

Applicants declared eligible but who fail to exercise the examination privilege within three years of the date of filing the application are required to file a new and current application and to pay a new application fee

Candidates should offer as sponsors or references two diplomates of this board with whom they are presently in contact, rather than men under whom they served as residents only It is required that sponsors be from the candidate s community and currently acquainted with the candidate and his ability in his practice of the specialty

On notice of acceptance for admission to examination, examination fee is due and also case records which should be shipped by the candidate to the secretary s office as soon as possible and not later than the date of the Part I written examination

The candidate should make immediate acknowledgment of his notice of acceptance, at which time he will notify the secretary s office approximately when to expect his case reports

EXAMINATIONS

Part I examinations are scheduled annually for early in February Grades cannot usually be mailed from the secretary s office until after April 1 following the examination Arrangements will be made for candidates to report in any convenient city where there may be a diplomate of this board to conduct or supervise the written examination which will be sent out from the board s office under sealed cover

Special arrangement will be made through senior officers for conducting the written portion of the Part I examination for men in military service Such candidates are requested to keep the secretary s office informed at all times of changes in their mailing addresses

All applicants accepted for examination will be required to obtain a passing grade in both the written examination and a review of case reports (Part I) before becoming eligible for the oral-clinical and pathology examinations (Part II) The passing grade for the written examination and case reports is 75 per cent A candidate whose grade in either or both falls below 75 per cent is conditioned

Reexamination for the removal of conditions in Part I may be taken after one year but within three years after the first failure without payment of an additional fee

Application for reexamination in Part I must be made by the candidate prior to November 1 of any year

Candidates who successfully complete the Part I examination proceed automatically to the Part II examination held later in the year

Candidates appearing for reexamination under a new application after two previous failures will not be required if they have passed all or part of the Part I examinations on their first application to repeat such examination items already successfully cleared

PART I

Examination consists of

1 A comprehensive written examination conducted annually, including questions on both obstetrics and gynecology and related basic sciences The written examination will be limited to a maximum period of three hours

2 The filing as early as possible, and not later than the date of the written examination, of twenty five obstetrical and gynecological case reports, in condensed form (See Sections on Case Reports)

Grades on case reports submitted for review prior to the written examination will be announced simultaneously with those of the latter, candidates who take the written examination but fail to submit case reports on or before the date of the written examination cannot be given the grade on the latter until their case reports have been received and graded

PART II

The oral-clinical and pathology examinations given all candidates are conducted by the entire board and the associate examiners usually near the time and place of the annual meeting of one or more of the national societies represented on this board Advance announcements of examination dates and place will be made in medical journals throughout the country

Examination consists of

1 Oral examination before two to four examiners

An endeavor is made to adapt the details of the oral examination to each candidate s experience and practice The examination is particularly directed to ascertain his familiarity with recent obstetrical and gynecological literature, the related basic sciences, the breadth of his clinical experience, and his general qualifications as a specialist in obstetrics and gynecology

2 Pathology examination

The candidate is expected to identify and to discuss several obstetrical and gynecological pathologic specimens and sections

Examiners report orally on each candidate to the assembled board, after which the results of their investigations are considered jointly by the entire board and associate examiners After a general consideration of the details of the candidate s oral and pathology examinations, including a review of his capability and general adaptability, the candidate is passed or failed by the entire board of directors

The final action of the board is based on the candidate s ethical and professional record, training and attainments, as well as on the results of his formal examination

When a candidate fails in Part II of the examination, he is not required to repeat Part I but is required to repeat Part II only One reexamination may be taken within three years of the original examination and first failure without formal reapplication papers Request for reopening of the candidate s original application must be filed with a reexamination fee of $25 (See Application and Fees) Application for reexamination in Part II must be made by the candidate prior to February 1 of any year Data regarding additional training or experience and medical school or hospital appointments acquired in the interim must be cited in the letter and verified on a Supplemental Training Form obtained from the office of the secretary of the board

The reexamination fee will be effective only on original applications filed subsequent to the date of this announcement namely, June 1 1949

The candidate may be allowed to reappear at the examination following the one failed by him The board may, at its discretion, deny the candidate the privilege of reexamination Requests for admission to reexamination must be accompanied by statements covering additional training, or opportunities for supervised clinical experience since the previous failure to justify such readmission

Failure to exercise the privilege of reexamination within three years entails the filing of a new application with the usual application and examination fees

After two failures in either Part I or Part II on the first application the candidate may reapply and be readmitted to examinations once only Exceptions to this ruling can be made only by action of the entire board of directors in annual session usually to be based on evidence of additional training and experience sufficient to warrant such action

CASE REPORTS

Case reports are to be sent by the candidate to the secretary as soon as possible after receiving notification of eligibility and not later than the date of the Part I written examination

Twenty-five important obstetrical and gynecological case reports, in condensed form, are required Five cases may concern major illnesses, not necessarily operative These reports must include a variety of material rather than a number of reports of one type Effective Jan 1, 1952 case reports from one residency's service shall not be more than five in number

Men holding full time medical school faculty appointments may submit half their case records from this full time, nonprivate practice, but post-training service (See Requirements.)

The candidate should prepare and maintain in his possession a carbon copy of his case records in case of possible loss in shipping

These reports are not to be copies verbatim from hospital records, but should be in condensed form

Evidence of adequate follow-up examination pertinent to each individual case must be submitted

The candidate should submit *separate verified index lists, in duplicate* for each individual hospital at which operations were performed All of these must be formally signed by the responsible hospital official (preferably the hospital superintendent), attesting in each instance that the candidate was the operator

In the upper left-hand corner of each index sheet there should appear

Candidate's Name, and Name and Address of Hospital

The data for each patient should be tabulated horizontally, reading thus

1 Sequence number of case report (1 to 25)
2 Whether patient was from the candidate's residency service or his own private or ward practice, as follows Res Serv " or "Own Practice *All records failing to have this information will not be considered acceptable*
3 Patient's name or identifying initials age, parity
4 Date of patient's admission and hospital admission number
5 Date of patient's operation
6 Date of patient's discharge
7 Dates of follow up examinations

At the foot of each index sheet should be placed the attested statement of the hospital official, referred to above This statement should read as follows

This is to certify that the above listed case reports have been verified by me from the records of this Hospital and these patients operated upon in this institution by Dr ——————, that the admission number and dates specified are correct This is further to certify that the reports given the following sequence numbers (———— to ———— inclusive) were from the residency service of the aforementioned physician and the reports given the following sequence numbers (——— to ——— inclusive) were from his own practice (ward or private) in this Hospital and that in all instances he was the chief operator

Signature

Official Title

Date

Each case report should be typewritten on standard size paper, 8½ x 11 inches, and these reports then assembled in sequence Covers should not be used for separats reports, as this increases their bulk unduly Reports should be bound loosely together in a light outside cover not larger than 10 x 12 inches, so that they may be opened and held like a book The following items should be observed

I Each case report should be headed by identifying information corresponding with that of the index lists, including sequence number, designation as a "Residency' or 'Own Practice" case, and so on

II The report of the case should begin with

1 Preoperative diagnosis
2 Postoperative diagnosis (based on findings)

III The report should be in condensed form, not reported in detail Follow up findings of not less than six (6) months are *essential* Omissions of follow-up examinations must be explained and justified

IV Obstetrical reports which do not include essential pelvic measurements and note of methods used, will be considered incomplete

V Critical summary or analysis of each report with critical deductions derived from correctness or incorrectness of candidate's procedures and from final results must be a final part of each report Lacking such summary, *reports will be considered incomplete and will not be graded*

GRADUATE TRAINING RESIDENCIES

This board, through the Council on Medical Education and Hospitals of the *American Medical Association*, has approved institutions providing acceptable residencies in obstetrics and gynecology

The American Board of Obstetrics and Gynecology has established the following requirements for its approval of a residency in a hospital department or service

1 It is most desirable that the Chief of the Active Visiting Staff of the Department be certified by the Board, in the interests of the proper teaching of the specialty of obstetrics and gynecology In lieu of such certification the Board will accept individuals of recognized high professional standing in the specialty At least one additional member of the staff shall be similarly qualified

2 Exceptions to the foregoing, in respect to the certified status of Chiefs of Service and others as outlined above, can be made by assent of the Committee on Residency Training for adequate and justifiable reasons As examples of the latter, the degree of F.A C S in obstetrics gynecology may be accepted in lieu of one of the two required certifications if the general reputation of the person concerned is known to the Committee as national or sectional in scope, or a professonal rank without certification might be acceptable

3 In instances where the services of obstetrics gynecology are not combined but are separate in any given hospital, the Chief of each such service seeking approval and at least one of his subordinates must be certified or otherwise qualified as out lined above

If obstetrics and gynecology are not combined in one department, approval can be granted only if arrangements are made for some degree of rotation of residents between both services, provided both services are separately approved

4 If gynecology is classified in the given hospital as a subdivision or subservice of general surgery, approval *cannot* be granted for residency training in gynecology Exceptions have been made if the subdivision of gynecology is headed and staffed by a chief and at least one other certified by this board or otherwise qualified as specialists in obstetrics gynecology, as specified above, thus insuring an acceptable educational program in obstetrics gynecology

5 Effective July 1, 1948, "temporary approvals pending survey" were *discontinued* It is expected that all presently approved hospitals will soon be initially surveyed, if holding temporary approval, or resurveyed and redesignated if holding unconditional approval

6 Departments holding official approvals for residency training are cautioned that their totals of residents appointed must be kept to the number specified in the A M A—American Board approval notification Dilution of training facilities by unauthorized appointment of residents in excess of these numbers may be cause for reinspection and changes in approval status of such hospitals and their special services

7 For further details of requirements and qualifications for approval for residency training, hospital officials should refer to the latest special issues of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION as they appear during each year, dealing with these subjects, *or should apply to the Council on Medical Education and Hospitals of the American Medical Association for bulletins entitled Essentials of Approved Residencies and Fellowships*

8 Application for residency approval must be made in triplicate on special forms provided for this purpose These forms may be obtained from the Secretary of the Council on Medical Education and Hospitals of the American Medical Association, or from the Secretary of the *American Board of Obstetrics and Gynecology* All statements amplifying an application should also be made in triplicate The hospital should keep a duplicate of all papers

9 The formal application, with all papers, for residency training approval should be submitted primarily to the Council on Medical Education and Hospitals of the American Medical Association, 535 North Dearborn Street, Chicago 10, Illinois Action is taken jointly by the Council and this Board after survey by the Council

10 Approvals are granted according to adequacy of the training program and teaching facilities of various institutions on the following several bases (a) one year approval in obstetrics and gynecology (combined) or one year approval in obstetrics and/or in gynecology (separate), correlated basic science instruction being an essential part of the first year, (b) two-year approval in obstetrics and gynecology (combined) or two year approval in obstetrics and/or in gynecology (separate), provided there is opportunity in the latter instances for some degree of rotation between the two services as well as laboratory instruction in basic sciences, (c) three year approval in obstetrics and gynecology (combined) or in obstetrics or in gynecology, provided there is opportunity for one to one and one half years' service in the branch of the specialty opposite to that in which the candidate holds appointment, as well as laboratory instruction in the basic sciences of both branches

Three (3) years approval is available to institutions holding active medical school teaching affiliations Other institutions may acquire three (3) years approval if their educational programs and teaching facilities are adequate for such approval Probably the most desirable type of approval, from the hospital s standpoint is that of two (2) years in obstetrics and gynecology, because of the greater flexibility regarding appointments These two (2) years may be the first two (2) following a trainee s internship or they may be the last two (2) of his formal training following an internship plus one (1) year of acceptable training in the specialty A service with two year approval may also, if it desires, appoint a man for only one (1) year, as for example if he has already had two (2) years of approved training

Many institutions with three year approval appoint a group of men for the first year, promoting only part and releasing some of them at the end of this time Other institutions are accredited for only one (1) year and both will from year to year provide partly trained men for the two year institutions, which may thus complete a candidate s required training

Some institutions may be granted one year approval either because of limited facilities or, in certain instances, because of the preference of the institution which may require that candidates for such positions must show evidence of having completed two (2) years of satisfactory training

No stipulation has been made that an institution holding only one-year training approval must provide this as the first year of a candidate s formal training It may be his second or even his third year, responsibilities being graded accordingly, but if it is his first year laboratory basic science instruction is an essential part.

On the other hand, candidates may be promoted from year to year in one place for their entire service of three (3) years if this institution is so approved and listed

Exchange residencies within the specialty between approved institutions are acceptable and to be encouraged Many authorities believe that training in more than one institution is broadening to the candidate Farming out to unapproved institutions or services is not acceptable unless the work of such services is directly and carefully supervised by the Chiefs of the service in the approved hospital under which the man is actively appointed and working This should be attested by such Chiefs

Exchange residencies into other specialties cannot be permitted to subtract from the minimal required three (3) years of training divided between obstetrics gynecology

As noted elsewhere, two (2) years of post training practice limited to the specialty is necessary before a candidate becomes eligible for certification

This Board has no objection to residency services being arranged by hospitals for periods longer than three (3) years, unless this dilutes the candidate s clinical training opportunities too much during the first three (3) years However the Board does not accept a fourth year, or more of residency training as a substitute for any part of the required two (2) years of post training practice The importance of post-training practice in the specialty is emphasized as an opportunity for maturing of the candidate and for colleague appraisal of a man s ability when working on his own responsibility in his chosen community

Exception to this ruling may be made for men advancing from their training into and planning to remain in full-time teaching positions These men then must complete at least two (2) years in such positions Consequently the only institutions in which men may work as fourth and fifth year residents and obtain credit for this time as "post training practice" are those directly affiliated with approved schools of medicine as teaching hospitals for undergraduate instruction These full time ' men must hold faculty appointments, must have teaching duties with undergraduate students must be given independent authority more than that of residents, and must make a declaration of intention to remain in full time teaching work

11 Lists of officially approved institutions for formal residency training appear regularly in certain issues of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION Detailed information about any of these can be obtained from the Association

12 Any physician formally obligating himself to serve a residency in a Council on Medical Education and Hospitals of the American Medical Association American Board of Obstetrics and Gynecology approved hospital and thereby eliminating other possible candidates from the position, who breaks his contract without justifiable cause, either before beginning his service or during his period of service, except by mutual consent and agreement between the candidate and the hospital, may be barred from the examinations for certification at the discretion of the board

PRECEPTORSHIP TRAINING

It should be recalled by all concerned that credits for graduate training may be obtainable in certain instances for residency or assistantship service in hospitals not officially approved for residency training Each such case must be individually considered, and credits will be largely dependent on the teaching qualifications of those in charge of the service, and the clinical facilities of the hospital in question

As a substitute for part of the required total of formal residency training, service with a qualified obstetrician gynecologist preceptor, preferably one who has been certified by the board, may be acceptable The exact time basis for this has not been specified, and each case must be reviewed and decided individually by the Credentials Committee after the application is submitted in the regular manner The time allowance for this type of training will vary with the amount of work done with the preceptor It is unusual for more than six months' credit to be given for one year of preceptorship training

An acceptable preceptor is a specialist in obstetrics and gynecology of long experience certified by this board His volume of office and hospital practice must be large enough to offer ample opportunity for the candidate's training Preceptorship training should include participation in procedures of office and hospital practice, including operative and obstetric responsibilities, with adequate time devoted to the studies of basic sciences and pathology and the study of current literature pertaining to this specialty The preceptor should supervise closely the candidate s work and keep an informative record of the candidate s performance in order to facilitate the board s efforts in evaluating the adequacy of the candidate's training

Candidates who propose to offer preceptorship training for any part of their necessary credits before this board should request Preceptorship Training forms to be sent them by the office of the board in addition to the application blank These forms are to be filled out by the candidate, executed by the preceptor and returned by him directly to this office, with a covering letter amplifying any of his statements or the data contained in the preceptorship form

The post training practice requirement cannot be considered as being carried on concurrently with preceptorship training It must be dated from the time when a candidate is considered by his preceptor and the board, as having completed his training The candidate need not discontinue or change the status of his assistantship to establish these dates The Credentials Commit tee is not likely to allow more than six months' training credit to be given for each year of preceptorship training as compared with the more intensive formal residency training

CERTIFICATION

Each certificate granted or issued does not of itself confer or purport to confer on any person any degree or legal qualifications privileges or license to practice obstetrics or gynecology, nor does the board intend in any way to interfere with or limit the professional activities of any duly licensed physician Its chief aim is to standardize qualification for specialists in obstetrics and gynecology, and to certify as specialists those who voluntarily appear before the board for such recognition and certification, according to its regulations and requirements

The board does not subscribe to any hospital rule that certification is to be required for medical appointments especially in ranks lower than chief or senior staff of hospitals or associate professorship in schools of medicine, for the obvious reason that such appointments constitute desirable specialist training

Even though certification or its full equivalent may be considered a desirable requisite to appointment in key positions, as on the senior or chief staff, particularly of hospitals expecting to conduct approved services for training of residents it was never intended by this board that certification should be required by any hospital as a prerequisite to appointment especially in such lesser positions

AMERICAN BOARD OF OPHTHALMOLOGY

John H Dunnington, Chairman New York
Derrick T Vail, Vice Chairman, Chicago
William L Benedict Consultant, Rochester Minn
Conrad Berens, Consultant New York
Walter B Lancaster Consultant Boston
Georgiana D Theobold, Consultant Oak Park Ill
Francis H Adler Philadelphia
James H Allen New Orleans
Walter S Atkinson, Watertown N Y
Frederick C Cordes, San Francisco
F Bruce Fralick Ann Arbor
Robert J Masters, Indianapolis
Brittain F Payne, New York
M Hayward Post, St Louis
Phillips Thygeson San Jose Calif
Edwin B Dunphy, Secretary Treasurer Boston
Miss Lea M Stelzer, Registrar 56 Ivie Road Cape Cottage, Maine

Address all communications to the American Board of Ophthalmalogy, Cape Cottage Maine

REQUIREMENTS

All candidates must comply with current board regulations regardless of time of filing application

The secretary is not permitted to make decisions as to requirements These rulings are made only by the Committee on Credentials after reviewing the candidate's formal application

PREREQUISITES

1 High ethical and professional standing

2 Full citizenship in the country where the candidate practices (Limited to countries of North and South America, their possessions and territories)

3 A degree from a medical school of high standing, satisfactory to the board and approved by the Council on Medical Education and Hospitals of the American Medical Association An applicant whose training has been received outside of the United States and Canada must present credentials satisfactory to the board and is required to have the certificate of the National Board of Medical Examiners if he has been in practice less than ten years

4 Completion of an internship of not less than one year in a hospital approved by the same Council

5 Not less than thirty six months (a total of sixty months is required of candidates practicing both ophthalmology and otolaryngology) of combined study, training and practice of ophthalmology in approved medical schools hospitals, clinics, dispensaries laboratories, preceptorships and private practice

GENERAL REQUIREMENTS FOR ALL CANDIDATES

1 *Application* forms must be filled out completely and accurately Letters of endorsement, together with any other required credentials, must be sent to the secretary's office before the deadline date

2 Fee of $100 remitted with application

3 A list of papers or books published

4 Written qualifying test

5 Practical examination

6 Special review of ophthalmic surgery

7 Membership in the American Medical Association or such other societies as are recognized for the purpose by the Council on Medical Education and Hospitals of the American Medical Association

FEES

For written test and original examination, $100 (as mentioned previously)

Repeating Written Qualifying Test, $65
Repeating Practical Examination $65
Single conditions Written or Practical (except surgery), $35
Repeating Practical Surgery, $35
Two or more conditions, $35

Written qualifying test must be taken within three years of date of application Thereafter new application and fee are required

The fees have been carefully computed on a basis of cost of examinations and are used entirely for administrative expenses Examiners serve without compensation other than actual expenses

SPECIAL TRAINING

This shall include

1 Graduate study of the basic medical sciences which are fundamental to the intelligent practice of ophthalmology, particularly anatomy, histology embryology, optics, physiologic optics visual physiology and psychology, pathology, bacteriology, pharmacology disorders of ocular motility and binocular vision, perimetry, and in the skilful adjustment and use of instruments such as the ophthalmoscope retinoscope, slit lamp and microscope Mere factual knowledge is not sufficient, the candidate must have had training in the application of these subjects and in their use in clinical ophthalmology, especially in refraction

2 Active clinical experience in approved hospitals, clinics, dispensaries and private practice Library and laboratory facilities should be utilized for intensive study of cases

The subject matter to be covered under 1 and 2 is outlined in the syllabus prepared by the board

These requirements may be met in various ways

BASIC STUDIES

Anatomy
Embryology and developmental abnormalities
Biochemistry
Pathology
Bacteriology and immunology
Optics and physiologic optics
Ocular physiology
Medical Ophthalmology
Therapeutics and pharmacology
Neuro-ophthalmology

These may be covered by

A *Graduate Study* —By a curricular course in the basic sciences related to ophthalmology in an approved graduate medical school

B *Postgraduate Study* —By courses in individual basic sciences related to ophthalmology as given at various approved institutions The Home Study Course of the American Academy of Ophthalmology and Otolaryngology is recommended

C *Residency* —By advanced study of these subjects during a residency and by correlation of the principles involved with clinical problems

D *Research Fundamental and Clinical* —By the detailed study, under supervision or as assistant to an experienced research worker, of some problem or topic which brings the basic sciences into direct relation with the concrete clinical problem

CLINICAL EXPERIENCE

A By residency in an approved hospital The most desirable of these residencies have regular lectures covering the entire field of clinical ophthalmology and of the basic subjects as applied in clinical practice Many of these have seminars at which residents report cases which they have carefully worked up These are discussed by the other residents and by the staff and the method of presentation as well as the subject matter critically considered

B By residencies in hospitals where regular instruction by lectures and quizzes and seminars is not available The syllabus issued by the board will guide the resident in his selection of topics to be studied

C By fellowships in ophthalmology

D By preceptorship with a well trained and critical ophthal mologist

E After completing a residency it is of great advantage to secure a position in a clinic as fellow or assistant This may require only part time work, but due credit will be given Its value to the student depends on how much study he puts into it and on how competent his seniors are

F Research under competent critical and sympathetic super vision will give first hand insight into (1) the methods whereby old knowledge was and new knowledge is acquired and (2) the pitfalls which accompany attempts to enlarge the sphere of knowledge Only in this way can the candidate evaluate basic facts in the intelligent critical way which is expected of the specialist in practice

G The candidate who cannot secure the type of residency he desires should not despair, for his progress depends far more on how he uses his opportunities than on the opportunities themselves

WRITTEN QUALIFYING TEST

Before being accepted for examination candidates are given a written test to ascertain their qualifications The questions may cover any part of ophthalmology and are especially devoted to the basic studies as listed above The written test will be given in several principal cities at the same time Choice of cities is determined largely by the geographical distribution of candi dates Candidates found acceptable will be notified to appear for a subsequent practical and clinical examination in ophthalmology

EXAMINATIONS

Examinations usually are held annually at or near the time and place of the meeting of the American Medical Association, also at other times and places at the discretion of the board, depending on the number of applications from any region

The board reserves the right to limit the number of candidates to be admitted to any one examination

Candidates must be examined in all subjects listed in the sections titled Basic Studies and Practical and Clinical Exami nation The time spent in preparation will count less than the knowledge and experience acquired as shown on examination

PRACTICAL AND CLINICAL EXAMINATION

The subjects of the practical examination are as follows (1) External Diseases (2) Ophthalmoscopy, (3) Histopathol ogy, (4) Refraction (5) Motility (6) Ophthalmic Surgery, (7) Perimetry

1 *External Diseases of the Eye and Adnexa* —Various methods of examination diagnoses and treatment

2 *Ophthalmoscopy* —Patient will be examined by the candi date and the findings described or drawn A candidate is required to bring his own ophthalmoscope

3 *Pathology* —The candidate will demonstrate familiarity with general clinical pathology as well as the etiology pathology and bacteriology of diseases of the eye He will be asked to examine microscopic slides and to recognize normal and pathologic histology of the eye

4 *Refraction* —A candidate will examine patients and show mastery of various methods and of the principles of refraction and of retinoscopy He should bring his own retinoscope

5 *Motility* —The candidate will demonstrate on patients his familiarity with routine methods of examination and diagnosis

6 *Ophthalmic Surgery* —A candidate will demonstrate his surgical technic on animal eyes He must bring his own equip ment for performing an extracapsular combined extraction of the lens

7 *Perimetry* —The candidate will be given an opportunity to examine patients by use of the arc perimeter the tangent screen and the stereocampimeter He may also be required to interpret charted fields

SPECIAL REVIEW OF SURGICAL CASES

The board now requires of all candidates a list of ophthalmic operations performed within two years prior to examination This list is to be presented with application

The operations should be listed in groups of each type of surgery The numbers of operations in each group must be totalled and the total number of all operations shown This list must contain the following data

1 Date

2 Condition or conditions for which operation was performed Complications during hospitalization

3 Name and character of operation

4 Identification by hospital or clinic number, or the name of a consultant or confrere who was present at the time of operation

Circumstances which prevent any candidate from fulfilling this requirement should be fully explained, with detailed statement of candidate s surgical experience

CERTIFICATION

The decision of the board is final as to the candidate s passing failure or partial failure The final action of the board is based on the candidate s ethical and professional record training and attainments as well as on the results of his formal examinations

REEXAMINATION

Candidates may be reexamined as often as they desire on satisfactory evidence of adequate additional preparation and payment of reexamination fee A minimum of one year must elapse between examinations when a candidate is conditioned *in one or more subjects A minimum of two years additional* preparation is required of candidates who fail in all subjects The board may at its discretion deny the candidate the privilege of reexamination

NO DEGREES OR LEGAL RESTRICTIONS

Each certificate granted or issued does not of itself confer or purport to confer on any person any degree or legal qualifications, privileges or license to practice ophthalmology, nor does the board intend in any way to interfere with or limit the professional activities of any duly licensed physician Its chief aim is to elevate the standards of qualification for specialists in ophthalmology and to certify as specialists doctors of medicine who appear before the board for such recognition and certification according to its requirements and regulations

HAROLD A SOFIELD, Secretary Treasurer 122 S Michigan Ave Chicago 3

RULES AND PROCEDURES

I GENERAL ELIGIBILITY REQUIREMENTS

1 Satisfactory moral and ethical standing in the profession

2 Graduation from a medical school of the United States or Canada recognized at the time of graduation by the Council on Medical Education and Hospitals of the American Medical Association or graduation from a foreign school considered satisfactory by the aforementioned Council

3 Completion of an internship of not less than one year in a hospital approved at that time by the Council on Medical Education and Hospitals of the American Medical Association or, if trained in foreign countries, in institutions considered satisfactory by the American Board of Orthopaedic Surgery

4 Starting in 1952 and continuing subsequently, applicants taking Part I examinations for the first time must have completed not less than one year of resident training in general surgery in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association, or present evidence of comparable training in general surgery considered satisfactory by the American Board of Orthopaedic Surgery The minimum of one year of training in general surgery is in addition to the minimum of one year of internship

5 Completion of formal requirements for Part I or Part II examinations These formal requirements can only be satisfied by training in one or two categories

(*a*) resident orthopaedic training
(*b*) preceptorship training

Applicants may no longer be admitted to examinations, or be certified, on the basis of extensive specialized practice and/or teaching appointments and/or many short unapproved courses

6 Restriction of practice to orthopaedic surgery

II Requirements for Part I Examination

1 Completion of and compliance with aforementioned general eligibility requirements

2 Citizenship in the United States or Canada, or possession of citizenship papers showing intent to become a full citizen

3 Satisfactory completion of a minimum of one year of approved training in orthopaedic surgery under a program of resident orthopaedic training, or completion of a minimum of five years of orthopaedic training under a preceptorship program Starting in 1952 and continuing subsequently, in addition to the aforementioned requirements, applicants taking Part I examinations for the first time will be required to have satisfactorily completed a minimum of two years of approved training in orthopaedic surgery instead of one year previously required Applicants training on preceptorship programs will still be required to have completed a minimum of five years of orthopaedic training

4 Evidence of competence in training

5 Approval for examination by the Committee on Eligibility of The American Board of Orthopaedic Surgery

III Requirements for Part II Examination

1 Successful completion of Part I examination

2 Full citizenship in the United States or Canada

3 License to practice in the United States or Canada

4 Membership in the American or Canadian Medical Association

5 Satisfactory completion of a minimum of three years of approved resident training in orthopaedic surgery, plus a minimum of two subsequent years of practice period for applicants trained under resident orthopaedic training programs

6 Satisfactory completion of a minimum of five years of practice period for applicants trained under preceptorship programs

7 Evidence of competence in practice

8 Approval for examination by the Committee on Eligibility of the American Board of Orthopaedic Surgery

IV Application and Examination Fee Schedule

1 Application for Part I, fee $15, not returnable

2 Examination, Part I, fee $35, payable only if approved for examination Approved candidates failing to appear for scheduled examinations forfeit fees

3 Application for Part II, fee $15, not returnable

4 Examination, Part II, fee $50, payable only if approved for examination Approved candidates failing to appear for scheduled examinations forfeit fees

5 Reexamination, Part I, fee $35, for Part II, fee $50 No application fee is required for reexamination

V Applications

1 Applications for Part I examinations must be received in the office of the secretary of the board before November 30 of the year preceding the examination

2 Applications for Part II examinations must be received in the office of the Secretary of the Board before August 15 of the year preceding the examination

3 Notices of acceptance for admission to the Part I examinations are mailed to eligible candidates during the month of February in the year of the examinations

4 Notices of acceptance for admission to Part II examinations are mailed to eligible candidates during the month of November in the year preceding the examination

5 Questions of eligibility for examinations are decided by the Committee on Eligibility of the board This committee meets twice yearly The secretary is not empowered to rule on questions of eligibility

VI Examinations

1 Part I examinations are held once yearly, usually in April or May, in various centers in the United States

2 Part II examinations are held once yearly, usually in one center, immediately preceding the meeting of The American Academy of Orthopaedic Surgeons

VII Certification

1 Applicants who successfully pass Part I examination will receive no certificate but will be notified by letter by the secretary

2 Applicants who successfully pass Part II examinations receive a Certificate of the Board which states that they have been found qualified to practice the specialty of orthopaedic surgery in those fields in which they have been trained and examined

3 Candidates obtaining certification without training and examination in children's orthopaedic surgery may subsequently add certification in children's orthopaedic surgery by completing a minimum of one year of approved resident orthopaedic training in children's orthopaedic surgery and successfully passing examination in that field A practice period of one year is required following completion of resident training prior to examination for additional certification

VIII Approved Residencies

1 In the United States, resident training must be taken in institutions approved for resident training in orthopaedic surgery by the Council on Medical Education and Hospitals of the American Medical Association All approved institutions are listed at frequent intervals in the Internship and Residency number of The Journal of the American Medical Association Lists may be obtained from the American Medical Association and are not obtainable from the board

2 The integral parts of approved residencies are designated in lists by the following symbols A—Adult Orthopaedic Surgery C—Children's Orthopaedic Surgery, F—Fracture Surgery, and S—Basic Science training Approved lengths of training in institutions is also designated

3 Candidates electing an additional year of training in adult orthopaedic surgery and fracture surgery in lieu of a year in children's orthopaedic surgery may satisfy requirements by continuing their training beyond the designated approved length of time in institutions approved for adult orthopaedic surgery or adult orthopaedic surgery and fractures

4 Credit for resident training is not retroactive Candidates must receive resident training in institutions during periods that such institutions are on the approved list If candidates are in training at institutions at the time that such institutions become approved resident training credit may be granted from the start of the training period provided that the program is judged to have been satisfactory

5 Candidates in resident training, or possessing signed contracts for future resident training in institutions which become disapproved either in whole or part, receive resident training credit for the entire period during which their contracts are in force

6 The term "fellow" is considered synonymous with "resident" when the position occupied and the work performed is equal in all functions Fellowships in institutions having residents, in which training and responsibilities are not equal, are not credited as resident training

7 Institutions approved for resident training in orthopaedic surgery by the Council on Medical Education and Hospitals of the American Medical Association may, with prior acceptance by

the American Board of Orthopaedic Surgery and notification to the Council, utilize the training facilities of institutions not individually approved for resident training by the aforementioned Council, provided that

(a) The training supplements services in the same categories in which the institution responsible for training is approved by the Council

(b) The resident spends at least half of the minimum required time in each category of training in institutions approved by the Council

8 Foreign residencies must satisfy the American Board of Orthopaedic Surgery

9 Application for approval of the training facilities of any institution must be made to the Council on Medical Education and Hospitals of the American Medical Association, and inspection of such facilities is made by representatives of the Council Final approval is a joint function of the Council and the American Board of Orthopaedic Surgery

IX Requirements of Resident Orthopaedic Training

1 Institutions approved for full three year programs including all parts of the training requirements may integrate all parts so that they are given concurrently

2. Institutions now approved for less than three years of orthopaedic resident training should arrange with other approved institutions to provide complete three year programs for all residents It is planned that such desirable complete programs, with their participating institutions, will be listed separately

3 The minimum requirements of orthopaedic resident training are as follows

(a) One year of training in adult orthopaedic surgery

(b) Six months of training in the basic sciences

(c) Six months of training in fracture surgery

(d) One year of training in children's orthopaedic surgery or, if elected, an additional year of training in adult orthopaedic surgery and fracture training in place of training in children's orthopaedic surgery

4 Candidates who elect an additional year of training in adult orthopaedic and fracture surgery instead of a year in children's orthopaedic surgery may satisfy the requirements by taking the additional year of training in adult orthopaedic surgery or six months of adult orthopaedic surgery and six months of fracture surgery, but may not take the entire year of training in fracture surgery

5 Training in adult and children's orthopaedic surgery must include observation and first hand experience in diagnosis, treatment, operative and postoperative care of orthopaedic problems

6 Training in fracture surgery must include observation and first hand experience in diagnosis, treatment, operative and postoperative care of recent and old fractures

7 Training in the basic sciences must instill a sound knowledge of anatomy, pathology, physiology, bacteriology and biochemistry as these basic sciences apply to orthopaedic surgery

8 Candidates may complete the training requirements by training in several approved institutions provided that all the aforementioned minimum requirements are satisfied on approved services

9 No training period of less than six consecutive months in one institution may be credited toward resident training requirements, except a few short courses on the board's approved list and recognized supplementary services of approved institutions

10 Candidates in resident training may not engage in private practice

11 Candidates in resident orthopaedic training must receive their training in institutions and may not receive credit for time spent assisting in private office practice, which is considered as preceptorship training

12 Candidates trained on accelerated programs during the war years are credited with one year of training for each nine months' residency on established accelerated programs

X Requirements of Preceptorship Training

1 The preceptor must possess certification by the American Board of Orthopaedic Surgery

2 The practice of the preceptor must be extensive enough to give the candidate experience in all phases of orthopaedic practice

3 The preceptor must devote special periods of time each week, outside of the routine hours employed in hospitals and office practice, to assist the candidate with organized courses of study similar to those received during resident training

4 If facilities and instruction in the related basic sciences are not available, the candidate must spend a minimum of six months as a student in an institution approved for basic science training in orthopaedic surgery

5 The candidate must train as a full time assistant to the preceptor and may not maintain a separate office or engage in individual practice

6 The minimum training period in orthopaedic surgery under the preceptorship program is five years, after which time the candidate may file application for Part I examinations

7 The minimum practice period required for candidates trained under the preceptorship program is five years, after which time the candidate may file application for Part II examinations This makes a minimum total of ten years from the start of orthopaedic training to eligibility for Part II examinations

8 The practice period may be satisfied in individual private practice or in assistantship or partnership as desired by the candidate

9 Candidates who combine preceptorship training with approved resident training receive credit for the preceptorship portion of their training only if it totals a minimum of two years Two years of preceptorship training is credited as the equivalent of one year of resident credit The practice period requirement is likewise evaluated so that three years of practice are required if the candidate submits two years of preceptorship and two years of resident training, and four years of practice are required if four years of preceptorship and one year of resident training are submitted

XI Sequence of Examinations and Practice Requirements

1 No person may take Part II examinations until after successful completion of Part I examinations

2 Successful completion of Part I examinations in no way obligates the board to declare a candidate eligible for Part II examinations

3 Regardless of how extensive or prolonged a practice a candidate may have had prior to completing the training requirements, such time may not be credited toward practice requirements All practice requirements must be satisfied subsequent to completion of training requirements

4 Candidates may not be admitted to examinations on the basis of prolonged practice but must qualify on the basis of formal training in one of the categories previously detailed

XII Practice requirements

1 Candidates must maintain high ethical and professional standards

2 Candidates must strive to increase their scientific knowledge

3 Candidates must limit their practice to orthopaedic surgery

4 Candidates who have had no approved training in children's orthopaedic surgery must confine their practice to fracture and adult orthopaedic surgery

5 Candidates trained in resident orthopaedic training are required to complete a minimum of two years or orthopaedic practice subsequent to the completion of their formal training before becoming eligible for Part II examinations

6 Candidates in private practice must spend a minimum of fourteen months in one locality immediately prior to application in order that practice may be properly evaluated

7 Candidates employed full time in institutions may satisfy practice requirements by serving a minimum of two years, but minimum requirements may not be satisfied by mixing full time institutional work with preceding or subsequent time in private practice

8 Candidates trained by preceptorship are required to complete a minimum of five years of orthopaedic practice before becoming eligible for Part II examinations The practice period may be independent of the preceptor

XIII METHOD OF EXAMINATION

1 Part I examinations consist of a written examination and oral examinations Material covered includes fundamental surgical principles, elementary fractures and orthopaedic procedures, history taking and physical examinations as well as those parts of anatomy, pathology, physiology and biochemistry related to orthopaedic surgery The oral examinations consist of five parts (*a*) anatomy, (*b*) pathology, (*c*) physiology and biochemistry, (*d*) surgery and (*e*) fractures and orthopaedic surgery

2 Part II examinations consist of a written examination and oral examinations Material covered includes advanced work in all phases of orthopaedic surgery The oral examinations consist of five parts (*a*) anatomy, (*b*) pathology, (*c*) children's orthopaedic surgery, (*d*) fractures and (*e*) adult orthopaedic surgery

3 *Candidates who have not had approved training in children s orthopaedic surgery will not be examined in that branch of orthopaedic surgery*

4 *Candidates are notified by letter as to whether they passed or failed in the examinations No information regarding results is available until such letters are mailed*

5 *Results of integral parts of examinations are not available to either candidates or diplomates of the board*

6 Candidates who have passed Part I examinations are required to take Part II examinations within a ten year subsequent period *If there is a lapse of more than ten years candidates must repeat Part I examinations and must then become eligible by the requirements then in force*

XIV REEXAMINATIONS

1 Applicants who fail to pass Part I or Part II examinations may be reexamined a second or third time in each Part, but must pay the prescribed examination fee each time of reexamination

2 Applicants who fail to appear for second and if necessary, third reexaminations within three years after first failure must submit new applications with the appropriate fees

3 After three successive failures in Part I or Part II examinations, applicants must present evidence of additional orthopaedic training satisfactory to the board before submitting new applications

XV MILITARY SERVICE

1 Medical officers who have elected service in the military forces as their life careers compete for certification on the same basis as do doctors in civilian practice

2 Doctors who serve for a minimum of one year in the military forces during the war years between January 1, 1941 and July 1, 1946, are granted a bonus of one year of practice credit, provided that the same time is not used for resident training credit

3 Applicants who served in military hospitals whose service is judged by the board to have been equal to that of approved resident orthopaedic training, and who were on such service for a minimum of one year between January 1, 1941 and July 1, 1946, may be granted credit for one year of resident orthopaedic training, provided that the same time is not used for practice credit Applicants requesting such credit must submit completed "Record of Professional Assignments booklets with their applications

4 No applicant may be granted more than one year of resident training credit and one year of practice credit for military service during the war years

5 After July 1, 1946, credit for orthopaedic training must have been or must be obtained by assignment as residents in military hospitals on the approved list for resident orthopaedic training, the same as in civilian life

6 Medical officers assigned to civilian institutions on the approved list for resident orthopaedic training receive the same credit as do civilian candidates

7 Medical officers who have elected service in the military forces as their life careers must satisfy the practice requirements by military assignments in which their duties are limited to the practice of orthopaedic surgery

XVI RECORDS OF SURGICAL CASES AND INSPECTIONS

1 Records of a specified number of consecutive surgical cases may be requested by the board in order to evaluate properly the work of an applicant

2 A representative of the board may visit a community in order to evaluate properly the work of an applicant

AMERICAN BOARD OF OTOLARYNGOLOGY

Officers of the Board

LeRoy A Schall, President, Boston
John J Shea, Vice President, Memphis
Dean M Lierle, Secretary-Treasurer, University Hospitals, Iowa City

Senior Counselors

George M Coates, Philadelphia
Ralph A Fenton, Portland, Ore
Harris P Mosher, Marblehead, Mass
W E Sauer, St Louis
Ernest M Seydell, Wichita Kan
Frank R Spencer, Boulder, Colo
Fletcher Woodward, Charlottesville, Va

Board of Directors

Lawrence R Boies, Minneapolis
Louis H Clerf, Philadelphia
Russell M Decker, Pasadena, Calif
Gordon F Harkness, Davenport Iowa
Lyman H Heine, Fremont, Neb
Frederick T Hill, Waterville, Maine
Gordon D Hoople, Syracuse, N Y
Percy E Ireland, Toronto, Canada
Marvin F Jones New York
Francis E Le Jeune, New Orleans
Dean M Lierle, Iowa City
H I Lillie, Rochester, Minn

James H Maxwell, Ann Arbor, Mich
Philip E Meltzer, Boston
Werner Mueler, Boston
C Stewart Nash Rochester, N Y
Arthur W Proetz, St Louis
LeRoy A Schall, Boston
John J Shea, Memphis, Tenn
O E Van Alyea, Chicago

GENERAL REQUIREMENTS

The following general qualifications of candidates for examination are required by the board

1 A candidate must have been a citizen of the United States or the Dominion of Canada for three years or more

- (*a*) A candidate must have been a graduate five years or more of a medical school approved by the Council on Medical Education and Hospitals of the American Medical Association
- (*b*) A candidate must be of known good moral character and be ethical in his professional relationships
- (*c*) A candidate trained in a foreign country must be able to give proof of medical and graduate training comparable to the requirements of the board
- (*d*) A candidate from the United States or the Dominion of Canada must be a member of the American Medical Association or of the Canadian Medical Association respectively or other such medical societies of equal standing as are recognized by the Council on Medical Education and Hospitals of the American Medical Association

2 Candidates from foreign countries, who have received their training in otolaryngology in the United States are eligible for examination at the discretion of the board, providing they show proof that they are permanent residents and citizens of their respective foreign countries and provided they meet the general academic requirements of the board

SPECIAL REQUIREMENTS

1 A candidate must have had a general internship, of at least one year, in a hospital approved by the Council on Medical Educations and Hospitals of the American Medical Association

2 A candidate must be proficient in the applied basic sciences, fundamental to the intelligent practice of otolaryngology These include anatomy of the ear, nose and throat, neck chest, esophagus and nervous system, gross pathology and histopathology, bacteriology, physiology, didactic otolaryngology and the general fundamentals of surgery (This requirement may be fulfilled in a residency or fellowship service or in an approved organized postgraduate course)

3 In addition to the general internship, the required clinical training in otolaryngology may have been acquired in any of the following ways

(a) A three years' residency or fellowship in otolaryngology approved by the Council on Medical Education and Hospitals of the American Medical Association

(b) A four years residency or fellowship in otolaryngology and ophthalmology approved by the Council on Medical Education and Hospitals of the American Medical Association, provided one half of the training has been in otolaryngology

(c) A two years residency or fellowship in otolaryngology or a three years combined residency or fellowship in otolaryngology and ophthalmology approved by the Council on Medical Education and Hospitals of the American Medical Association provided this be preceded by at least one year s residency training in surgery or medicine, or by an additional year in an approved internship

(d) At least one year must be spent in private, group or institutional practice of otolaryngology following the period of special training

4 A candidate may be qualified for examination, at the discretion of the American Board of Otolaryngology, if in addition to the General Requirements and Special Requirements, he has limited his practice to otolaryngology for seven years in association with a hospital staff approved by the Council on Medical Education and Hospitals of the American Medical Association and the board

5 In exceptional circumstances certain candidates who cannot meet all of the above requirements may be accepted for examination on recommendation of the Credentials Committee, substantiated by action of the board

6 A limited certificate in one of the subspecialties of otolaryngology may be issued at the discretion of the board to an exceptionally well qualified individual in the special field in which the certificate is desired

All applicants must comply with current board regulations regardless of the time of filing application

APPLICATION AND FEES

1 Application must be made in duplicate on special blanks procured from the secretary The completed application blanks must be returned to the secretary together with the other required credentials, at least one hundred and twenty days in advance of the examination at which the candidate desires to appear

2 The applications must be accompanied by two small photographs of the candidate, together with verification of the period of enrolment from the institutions where training in otolaryngology was obtained, and the names of two or more otolaryngologists preferably diplomates of the board from the vicinity of the candidate s place of residency, to be used as references

3 The fee for the examination is $100 no part of which is returnable Of this sum $25 must accompany the application No application will be acted on until the $25 application fee is received The balance of the fee—$75—must be paid to the secretary on notification that the candidate has been accepted before an appointment is given for an examination A reexamination fee of $50 is required of candidates conditioned in one or more subjects

4 The fees have been carefully computed on a basis of cost of examinations and are used entirely for administrative expenses Examiners serve without compensation other than actual expense

5 The application remains valid for three years An applicant must appear for examination within this time or forfeit the fee

6 Candidates whose credentials have been found satisfactory and who meet the requirements of the board will be notified ninety days prior to the date of examination The number of candidates who can be admitted to any one examination is limited Due to a large number of applications on file, delay in assignment for examination may be inevitable Appointments will be given in the order applications are accepted and on payment of the balance of the examination fee

7 The board, acting as a committee of the whole, reserves the right to reject an applicant for any reason deemed advisable and without stating the same and the action of the board shall be final

EXAMINATION

Examination will be held at such time and place as the judgment of the board may dictate Advance notice of examinations will be given in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION and the several special journals devoted to otolaryngology So far as is possible these will be held biannually at, or near, the time and place of meeting of the American Medical Association, or special societies and of the American Academy of Ophthalmology and Otolaryngology The examinations cover from two to four days

Scope—This examination encompasses all phases of otolaryngology and peroral endoscopy, including maxillofacial surgery, and surgery of the neck, excluding the thyroid

The type of examination is as follows

1 Clinical covering the actual handling of patients, including history taking, physical and functional examinations, the use of laboratory and x ray findings and a discussion of differential diagnosis

2 Didactic, oral examinations covering all phases of otolaryngology

3 Gross and microscopic pathology

4 A written examination may be included when the board deems this advisable

REEXAMINATION

A candidate who is conditioned in examination may be admitted to a subsequent examination after one year and within the three year period dating from his application on payment of an additional fee of $50 and one hundred and twenty days' notice of intention to appear is required

Candidates who have failed in the examination may be accepted for reexamination on recommendations of the Credentials Committee Satisfactory evidence of further study and progress will be required A new application must be filed The fee for reexamination for such candidates is $100 $25 of which must accompany the application The balance of the fee, $75 will be due on notification of acceptance

CERTIFICATION

1 A certificate granted by the board does not of itself confer or purport to confer any degree or legal qualifications privileges or license to practice otolaryngology nor does the board intend or attempt in any way to interfere with or limit the professional rights and activities of any duly licensed physician Its aim is to improve the standards of practice of otolaryngology and to certify as specialists those who voluntarily comply with its requirements and regulations

2 The final action of the board is based on the candidate's ethical and professional record training and attainments as well as on the results of his formal examinations

AMERICAN BOARD OF PATHOLOGY

ROBERT A MOORE, President, St Louis
JAMES B MCNAUGHT, Vice President, Denver
ROGER BAKER, Birmingham, Ala
R PHILIP CUSTER, Philadelphia
A S GIORDANO, South Bend, Ind
JOSEPH A KASPER, Detroit
JAMES W KERNOHAN, Rochester, Minn
JOHN R SCHENKEN, Omaha
EDWIN W SCHULTZ, Stanford University, Calif
SHIELDS WARREN, Boston
WILLIAM B WARTMAN, Secretary-Treasurer, 303 E Chicago Ave, Chicago

A GENERAL REQUIREMENTS

1 Satisfactory moral and ethical standing in the profession

2 License to practice medicine or a certificate of the National Board of Medical Examiners

3 Membership or associate membership in the American Medical Association or membership in a national society acceptable to the board by citizens of the United States (At present, these include American Association of Pathologists and Bacteriologists, American Society of Clinical Pathologists, American Medical Association, or American Society for Experimental Pathology) For citizens of other countries, membership in a national medical society of that country is required

4 The applicant must devote his time primarily and principally to the practice of pathology

B PROFESSIONAL EDUCATION

1 Graduation from a medical school in the United States approved by the Council on Medical Education and Hospitals of the American Medical Association, or graduation from a medical school in other countries acceptable to the board

C SPECIAL TRAINING AND EXPERIENCE

1 The board admits candidates to examinations who are otherwise eligible and who have had *either* of two following types of training and experience

(*a*) After five years, if four of the five years have been in institutions approved by the Council on Medical Education and Hospitals of the American Medical Association or by the board, or

(*b*) After eleven years if none of the training and experience has been in institutions so approved

2. The specific requirements for those acceptable after five years are as follows

(*a*) Pathologic anatomy only

(1) Four years of supervised study and training in an institution approved for residency training in pathologic anatomy by the Council on Medical Education and Hospitals of the American Medical Association or by the board It is immaterial whether the candidate holds the title of resident or fellow or assistant Candidates may, at their own election, substitute not to exceed twelve months of a straight or rotating clinical internship or a fellowship or instructorship in any of the preclinical departments of a university for one of the four years In addition, time, not to exceed twelve months, spent in a department of pathology of an approved school of medicine after the completion of the second year of undergraduate study may be counted for full credit toward the four years

(2) One additional year which may be a continuation of the preceding or may be independent practice of pathologic anatomy in a hospital approved by the American Medical Association or other institutions acceptable to the board

(*b*) Clinical pathology only

(1) Four years of supervised study and training in an institution approved for residency training in clinical pathology by the Council on Medical Education and Hospitals of the American Medical Association or by the board It is immaterial whether the candidate holds the title of resident or fellow or assistant Candidates may, at their own election, substitute not to exceed twelve months of a straight or rotating clinical internship or a fellowship or instructorship in any of the preclinical departments of a university, for one of the four years *Candidates* holding also a master's or doctorate degree in a special field of clinical pathology (bacteriology serology, chemistry, parasitology or hematology) may obtain time credit *for not* more than twelve to twenty-four months toward the four years for this work, regardless of whether it was taken before or after the medical degree The evaluation of time credit will depend on how much of the broad field of clinical pathology was covered in the graduate work

(2) One additional year which may be a continuation of the preceding or may be independent practice of clinical pathology in a hospital approved by the American Medical Association or other institutions acceptable to the board

(*c*) Pathologic anatomy and clinical pathology

(*1*) Four years of supervised study and training divided as follows

(*a*) Two years of supervised study and training in pathologic anatomy as outlined in the preceding paragraph 2-(*a*)-(1)

(*b*) Two years of supervised study and training in clinical pathology as outlined in the preceding paragraph 2 (*b*) (1) Candidates declare deligible before July 1, 1953 may at their own election substitute one year (twelve months) of a straight or rotating clinical internship for one year of this special training in clinical pathology After July 1, 1953, all candidates applying for both pathologic *anatomy and clinical pathology will be* required to have two years of supervised training in clinical pathology

(2) One additional year which may be a continuation of the preceding or may be independent practice of both pathologic anatomy and clinical pathology in a hospital approved by the American Medical Association or other institutions acceptable to the board After July 1, 1953, candidates who elect to claim credit for one year for a clinical internship must take this fifth year as supervised study and training in clinical pathology in institutions approved for residency training in clinical pathology by the Councl on Medical Education and Hospitals of the American Med cal Association or by the board Candidates declared eligible after July 1, 1953, who do not take a clinical internship, may, after four years of training as outlined in 2-(1)-(*a*) and (*b*), spend the fifth year in independent practice in an institution or laboratory acceptable to the board.

NOTE —As outlined in the preceding paragraphs, the total time requirements of the board are unchanged after July 1, 1953, namely, five years of study or practice after graduation from medical school, with exceptions noted in *sections* 2-(*a*)-(*1*) and 2-(*b*)-(*1*)

3 The specific requirements for those acceptable after eleven years are as follows

(*a*) The practice of pathology under circumstances acceptable to the board for a period of not less than eleven years At the election of the candidates, a period not to exceed one year of straight or rotating clinical internship may be substituted for one of the eleven years For those candidates in this category who have had some special study and training in pathologic anatomy or clinical pathology acceptable under paragraphs 2-(*a*), (*b*) or (*c*), double time credit will be allowed Thus, if a person has two years of acceptable supervised study and training, only seven years of practice are required

D SPECIAL QUALIFICATIONS

1 Prior to Dec 31, 1947, the board at its discretion certified candidates without examination, if the following *conditions were* met as of July 1, 1939

(*a*) That the candidate has been for a period of five years of professional rank in a department of pathology in an approved medical school, or

(*b*) That the candidate *had been practicing* pathology for ten years in a senior *position in* a hospital having an adequate department of pathology, approved by the Council on Medical Education and Hospitals of the American Medical Association or *in an* institution acceptable to the board

CREDIT FOR MILITARY SERVICE

Credit may be allowed for training and experience in pathology in the federal services during the *period July* 1, 1940 to June 30, 1947 This credit for training or experience or both is *given on an* individual basis and will depend on the opportunity the applicant has had, as indicated by his or her medical service record in the specialty of pathology

After July 1, 1947, credit for those military services will be given on the same basis as it is in civilian institutions, except that the rule in the preceding paragraph will not apply to reserve officers who continue on active duty or are called to active duty after that date

SUBSPECIALTIES OF PATHOLOGY
(IN FORCE AFTER JULY 1 1948)

Candidates who have met all general requirements and who have successfully passed the examination in pathologic anatomy and clinical pathology may apply for special designation of a subspecialty of pathologic anatomy or clinical pathology The board, at its discretion, may approve this application and after the candidate has successfully passed a prescribed examination, will issue a certificate designating the subspecialty, reading "Pathologic Anatomy (Neuropathology)," "Clinical Pathology (Clinical Bacteriology)," etc

Candidates who have met all general requirements and who have had five years of special training and experience in a special field of pathology which is acceptable to the board may apply to the board for certification in this special field The board at its discretion, may approve this application, and after the candidate has successfully passed a prescribed examination, will issue a certificate reading 'Neuropathology,' 'Clinical Bacteriology," etc

APPLICATION BLANK AND FEE

Application must be made on the special form which may be procured from the secretary and forwarded with other required credentials and the application fee. An application cannot be given consideration by the board unless it is accompanied by the application fee

The application or examination fee for candidates is $50 If the candidate fails in his examination he will be admitted to a second examination after one year, but not later than three years without additional fee After two reexaminations the applicant must file a new application and pay an additional fee before a fourth examination will be given

The application fee of $50 has been determined after careful consideration and is based on actual estimates of the expenses of examination and administration None of the board members receive any compensation for their services except actual expenses incurred

If the applicant, for any reason, is deemed ineligible for examination by the board, his fee will be returned, however, the application fee is not returnable after the candidate has officially been accepted for examination and notified to report for the examination

EXAMINATIONS

Written and oral examinations will be held at the discretion of the board at or near the time and place of national medical meetings If a number of applications from any region of the country are received, an examination in conjunction with a national medical meeting in that section will be arranged so that the financial outlay of the applicant in meeting the examiners will be as small as possible

The examinations are to be based on the broad principles of pathology with emphasis on diagnosis, interpretation and technic The applicant may apply for certification in either pathologic anatomy or clinical pathology or both

The examinations in pathologic anatomy consist of a written test an oral examination on gross pathology and a practical examination in microscopic pathology The examination in clinical pathology consists of a written test and an oral and practical examination in the six phases of clinical pathology bacteriology hematology, clinical chemistry, parasitology, serology and clinical microscopy

DEFINITIONS

1 Pathologic anatomy is that branch of pathology which deals with the morphologic aspects of disease, recognition being given that that definition covers two phases of pathology

(*a*) The applied phase with special attention to the description and diagnosis of gross and microscopic specimens

(*b*) The academic phases of teaching and general morphologic diagnosis

2 Clinical pathology is that branch of pathology which deals with bacteriology immunology, clinical chemistry, parasitology, hematology endocrinology and clinical microscopy the application of the physical and biologic sciences to the diagnosis, prognosis and treatment of disease

BOARD NOT AN EDUCATIONAL INSTITUTION

The board is in no sense an educational institution and the certificates of the board are not to be considered degrees Therefore, the certificate does not confer on any person legal qualifications privileges, or license to practice medicine or the specialty of pathology The board does not purport in any way to interfere with or limit the professional activities of any licensed physician Its chief aim is to standardize the qualifications for the specialty of pathology and to issue certificates to those voluntarily complying with the requirements of the board

CRITERIA FOR APPROVAL OF INSTITUTIONS FOR TRAINING IN PATHOLOGY

In Sections C-2 a, C-2-b, and C-2-c of the General Requirements it is stated that candidates must have certain periods of supervised study and training The American Board of Pathology, in cooperation with the Council on Medical Education and Hospitals of the American Medical Association, certifies hospitals in the United States as satisfactory for this supervised study and training Lists of these hospitals are published in the Internship and Residency Number of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION each year In addition, the American Board of Pathology recognizes certain hospitals outside the United States and certain laboratories not connected with hospitals in the United States Inquiries concerning these should be directed to the Secretary of the Board

The general criteria for approval of hospitals and laboratories are both qualitative and quantitative On the score of quality, consideration is given to the qualifications of the Director of Laboratories and the associates and assistants the supervision of work of the person in training, the excellence of the educational program, and the exactness and completeness of the laboratory work performed On the score of quantity, consideration is given to the volume and distribution of laboratory work, both in absolute numbers and in relation to the size of the hospital, to the diversity and completeness of tests performed, to the size and equipment of the laboratory, and to the number of professional and nonprofessional personnel in relation to the volume of work

In general the qualitative standards will determine whether or not a hospital or laboratory is approved, and the quantitative standards will determine whether the approval is for 1, 2, 3 or 4 years of credit toward the requirements of the Board

In evaluation of applications the Board takes into consideration the following criteria

1 Director of laboratories or pathologist
   - (*a*) It is required that the responsible head of the laboratory hold the certificate of the American Board of Pathology in the subject for which the hospital is approved, or be eligible for certification, and that he or she spend full time in the hospital Full time is not interpreted in terms of hours, but rather that the director have no obligation outside the one approved hospital except in a university department of pathology where he and the residents have an opportunity to participate in the educational program,
   - (*b*) In special instances, the equivalent of full time by two or more qualified individuals will be accepted and one person need not spend the entire working day in the laboratory,
   - (*c*) In special instances, two or more hospitals will be approved as a unit with a single full time director of laboratories if it is apparent that a satisfactory training program can be conducted,
   - (*d*) In hospitals with over 350 beds, it is expected that the professional staff, in addition to the pathologist, will include one or more persons with special training and qualifications in the subspecialties of clinical pathology

2 Technicians

There are no absolute criteria, but it is expected that the number of technicians will be proportional to the volume of laboratory work and that, insofar as possible, the technicians will hold the certificate of the Registry of Medical Technologists of the American Society of Clinical Pathologists

3 Floor space of laboratory
In general it is believed that the size of the laboratory should be related to the size of the hospital and the volume of laboratory work A minimal ratio is 4 square feet of space in the laboratory, including morgue and autopsy room, for each bed in the hospital

4 Equipment for the laboratory
The variety and completeness of laboratory tests performed depends on the size of the hospital In all hospitals there should be facilities for the more common tests in clinical pathology, for study of surgical specimens, and for performance of autopsies In larger hospitals, the variety of tests performed should be larger and in hospitals with over 500 beds all recognized laboratory procedures should be available for study and treatment of the patients

5 Autopsy percentage
No institution with a percentage of less than 15 will be approved and those institutions with percentages between 15 and 40 will be given special scrutiny

6 Examination of surgical specimens
All surgical specimens should be sent to the laboratory for gross examination, and microscopic examinations should be made unless there are general or special reasons not to do so

7 Indices
There should be indices according to the names of the patients and the diagnoses of all surgical and autopsy material Indices of clinical pathology are left to the discretion of the hospital

8 Museum
There should be available fixed anatomic and pathologic specimens for study by the staff in proportion to the size of the hospital Properly filed and indexed color photographs may in part be substituted for museum specimens

9 Library
A reasonably complete library of modern books and recent unbound and bound journals should be available to the hospital, and the more commonly used books and journals should be on hand in the laboratory

10 Educational program
The work of the person in training should be supervised Conferences, seminars, journal clubs, and demonstrations should be conducted as frequently as the volume of material and the size of the staff justifies A clinicopathologic conference must be held at least every 2 weeks

11 Volume of laboratory work
(*a*) As indicated in the following categories no hospitals with less than 75 autopsies, 1000 surgical specimens and 25,000 tests in clinical pathology annually will be approved (Category D) except as outlined in the following paragraphs It is the belief of the board that less material than this is inadequate for the training of a pathologist
(*b*) In the field of clinical pathology, there should be a reasonable diversification of tests and in each category there should be sufficient absolute volume to provide training and experience There are no absolute criteria, but special scrutiny will be given to a hospital in which there is not a reasonable diversification and variety
(*c*) In the field of pathologic anatomy, a deficiency in either autopsies or surgical specimens may be made up by an excess of the other, if the deficiency does not exceed 20 per cent of the minimum required in the ratio of 1 autopsy to 75 surgical specimens Thus in a hospital approved for one year in pathologic anatomy and clinical pathology, the minimums are 75 autopsies and 1 000 surgical specimens If a hospital has 2,500 surgical specimens, it is acceptable if there are only 60 autopsies

If a hospital has met these minimal qualitative and quantitative standards, it will then, on the basis of the following quantitative standards, be approved for 1, 2, 3 or 4 years of training in pathologic anatomy, or clinical pathology, or both or some special field as shown for the number of residents indicated

CATEGORY A In both pathologic anatomy and clinical pathology for 4 years (as required of all candidates seeking certification in both fields who are examined after July 1, 1952)

Minimum 150 autopsies, 1750 surgical specimens, and 65,000 tests in clinical pathology for 4 residents Additional resident for each 50 autopsies or 500 surgical specimens, or 20,000 tests in clinical pathology

CATEGORY B In both pathologic anatomy and clinical pathology for 3 years This meets all requirements of the board for supervised training until July 1, 1952 Candidates examined after that date who seek certification in both subjects must take an additional year of supervised training in clinical pathology or pathologic anatomy, in another hospital which is approved for the deficiency of training required

Minimum 125 autopsies, 1500 surgical specimens, and 50,000 tests in clinical pathology for 3 residents Additional resident for each 50 autopsies, 500 surgical specimens, or 20,000 tests in clinical pathology

CATEGORY C In both pathologic anatomy and clinical pathology for 2 years Candidates taking two years in these institutions must have an additional year (2 years after July 1, 1952) in an institution in category A, B or D

Minimum 100 autopsies, 1250 surgical specimens, and 40,000 tests in clinical pathology for 2 residents Additional resident for each 50 autopsies, or 500 surgical specimens, or 20,000 tests in clinical pathology

CATEGORY D In both pathologic anatomy and clinical pathology for 1 year Candidates taking training in these institutions must have an additional 2 years (3 years after July 1, 1952) in institutions which are approved for the deficiency of training required

Minimum 75 autopsies, 1000 surgical specimens and 25,000 tests in clinical pathology for 1 resident Additional resident for each 50 autopsies, or 500 surgical specimens, or 20,000 tests in clinical pathology

Category E In pathologic anatomy only, for 3 or more years Candidates taking all training in these institutions will not be eligible for certification in clinical pathology unless an additional year (2 years after July 1, 1952) is taken in clinical pathology in institutions which are approved for the deficiency of training required

Minimum 175 autopsies and 1500 surgical specimens for 3 residents Additional resident for each 50 autopsies or 500 surgical specimens

CATEGORY F In pathologic anatomy only, for 2 years Candidates taking training in these institutions will not be eligible for certification in clinical pathology unless they take one additional year full time in clinical pathology (2 years after July 1, 1952) in institutions which are approved for the deficiency of training required, and will be eligible in pathologic anatomy only if another year is taken in another institution which is approved for one or more years in pathologic anatomy

Minimum 125 autopsies and 1250 surgical specimens for 2 residents Additional resident for each 50 autopsies or 500 surgical specimens

CATEGORY G In pathologic anatomy only, for 1 year Candidates training in these institutions will not be eligible in both pathologic anatomy and clinical pathology unless they take an additional year in pathologic anatomy and an additional year (2 years after July 1, 1952) in institutions which are approved for these periods of training Candidates seeking certification in pathologic anatomy only must study an additional 2 years in institutions which are approved for that period of training.

Minimum 75 autopsies and 1000 surgical specimens for 1 resident Additional resident for each 50 autopsies or 500 surgical specimens

CATEGORY H For postmortem part of pathologic anatomy for 2 years Credit is never allowed for more than 2 years Candidates taking training in these institutions may pursue further training as follows 1 For pathologic anatomy only An additional year in an institution in Category A B, C E, F or G with assignment to surgical pathology principally 2 For pathologic anatomy and clinical pathology An additional year (two years after July 1, 1952) in an institution in Category A, B C, L, M or N with assignment to clinical pathology and ½ year assigned to surgical pathology principally in an institution in Category A, B C, or J

Minimum 125 autopsies for 2 residents An additional resident for each 60 autopsies

Category I For postmortem part of pathologic anatomy for 1 year Candidates taking training in these institutions may pursue further training as follows 1 For pathologic anatomy only An additional two years in an institution in Category A, B, C, E, F or G with general assignments 2 For pathologic anatomy and clinical pathology An additional year (2 years after July 1, 1952) in an institution in Category A B, C, L M or N with assignment to clinical pathology and 1 year to an institution in Category A B, C, E, F or G

Minimum 75 autopsies for 1 resident

Category J Surgical pathology part of pathologic anatomy for 1 year Credit is never allowed for more than 1 year and the director of the laboratory must hold the certificate of the American Board of Pathology in pathologic anatomy or be eligible for certification Candidates training in these institutions may pursue further training as follows 1 For pathologic anatomy only An additional 2 years in an institution in Category H or in an institution of Category A, B or C with assignment to post mortem pathology only 2 For pathologic anatomy and clinical pathology An additional year (2 years after July 1, 1952) in an institution in Category A, B, C, L M or N with assignment to clinical pathology full time and an additional year to an institution in Category A, B D, E, F, G or H with assignment to postmortem pathology full time

Minimum 2000 surgical specimens for 1 resident An additional resident for each 1000 surgical specimens

Category K Special pathology as part of pathologic anatomy Credit for not to exceed ¼ the time credit (1 year if seeking certification in pathologic anatomy only 6 months if seeking both pathologic anatomy and clinical pathology) of candidates applying in pathologic anatomy may be taken in special laboratories with limited activities such as neuropathology, orthopedic pathology ophthalmic pathology, etc The candidate who receives credit in this category may, on request, have the field of special pathology designated on the certificate of the board

Category L Clinical pathology for 3 or more years Candidates taking 3 years of training in these institutions will not be eligible for pathologic anatomy unless they take an additional 2 years in institutions approved for pathologic anatomy

Minimum 100,000 tests in clinical pathology for 3 residents Additional resident for each 50 000 tests

Category M Clinical pathology for 2 years Candidates taking 2 years' training in these institutions must take the same additional training as in Category L to be eligible for pathologic anatomy also To be eligible for clinical pathology only, an additional year of clinical pathology must be taken in an approved institution

Minimum 75 000 tests in clinical pathology for 2 residents An additional resident for each 50 000 tests

Category N Clinical pathology for 1 year Candidates taking training in those institutions must take an additional 2 years in an institution in Category A, B, C L or M assigned to clinical pathology for eligibility in clinical pathology only To be eligible in pathologic anatomy and clinical pathology, an additional 2 years in approved institutions is required

Minimum 50 000 tests in clinical pathology for 1 resident

Category O Special clinical pathology as part of clinical pathology Candidates applying for clinical pathology only may receive credit for not in excess of ¼ of the training period (1 year if seeking certification in clinical pathology only, six months if seeking both pathologic anatomy and clinical pathology) for work in a special field of clinical pathology) for work in a special field of clinical pathology such as bacteriology serology, etc Under these circumstances on request the special field will be designated on the certificate of the board

Category P Research Residence in certain institutions in which full time is devoted to research with a direct application to the practice of pathologic anatomy or clinical pathology may be accepted for credit not to exceed one third the time requirement (20 months if no clinical internship 16 months if a clinical internship was taken) The board encourages research and believes that all candidates should carry on investigation during their training in all institutions Therefore this category is only for those wishing to do full time research

John McK Mitchell, Executive Secretary 6 Cushman Road, Rosemont Pa

APPLICANTS FOR CERTIFICATES

Requirements for Applicants[1]—All candidates for examination for certification must meet the following requirements

1 Graduation from an approved medical school

2 One year of rotating or one year, pediatric or other internship in an approved hospital

3 Two years of specialized residency type training in an approved pediatric center

On May 1 1946, it was ruled that at least one year of the two years of required residency training must be a full time pediatric in patient residency or internship in an approved institution Because of the shortage of residencies, the board at this time voted that temporarily' the second year of required residency training might be met in the ways listed below, although the board recommends that whenever possible candidates complete the two years as regular residents

All applicants admitted to approved graduate or postgraduate courses in pediatrics on or after July 1, 1950 shall receive residency training credit for that number of months actually spent in full time attendance at such courses, in excess of three months and up to a maximum of twelve months No credit shall be granted for part time graduate or postgraduate courses Courses of less than three months are credited only under special circumstances

(*a*) A maximum of three months credit each is allowed for full time residency type training in allied pediatric subjects, such as pediatric allergy, pediatric psychiatry, pediatric pathology, pediatric cardiology and newborn service

(*b*) A maximum of six months credit is allowed for residency training in an approved contagious disease hospital

4 A subsequent term of two years of specialized study or practice or a combination of the two Credit for one year toward this requirement is allowed for military service The maximum credit that any candidate may receive toward the practice requirement for work done prior to the completion of residency training is one year

Attention is invited to the fact that the primary duty of the resident must be the care of patients under supervision if full credit in satisfaction of the residency training requirement is expected Research residencies which involve little or no clinical training are creditable for only three months Research residencies which include significant clinical training may be prorated to a total of six months for a year of service Teaching fellowships may not be offered in lieu of residency appointments

Both research residencies and teaching fellowships are, of course, entirely acceptable in satisfaction of the practice or further study requirement Portions of a research residency not applicable for residency training credit may be carried over for practice credit

Preceptorships are not accepted for credit toward the residency requirement, but are accepted toward the practice requirement

The board defines service in a pediatric center as full time devoted to rounded experience in an approved hospital which includes ward and outpatient service experience with newborn, including prematures and both therapeutic and preventive pediatrics It is expected also, that the service will include adequate graduate training in the basic medical sciences as well as in the clinical laboratory and public health aspects of the specialty The time served in pediatric centers need not be continuous or spent in the same institution

---

[1] To avoid misunderstanding, the board advises all candidates to communicate with the office of the executive secretary before entering on training

3 Floor space of laboratory
In general, it is believed that the size of the laboratory should be related to the size of the hospital and the volume of laboratory work A minimal ratio is 4 square feet of space in the laboratory, including morgue and autopsy room, for each bed in the hospital

4 Equipment for the laboratory
The variety and completeness of laboratory tests performed depends on the size of the hospital In all hospitals there should be facilities for the more common tests in clinical pathology, for study of surgical specimens, and for performance of autopsies In larger hospitals the variety of tests performed should be larger and in hospitals with over 500 beds all recognized laboratory procedures should be available for study and treatment of the patients

5 Autopsy percentage
No institution with a percentage of less than 15 will be approved, and those institutions with percentages between 15 and 40 will be given special scrutiny

6 Examination of surgical specimens
All surgical specimens should be sent to the laboratory for gross examination, and microscopic examinations should be made unless there are general or special reasons not to do so

7 Indices
There should be indices according to the names of the patients and the diagnoses of all surgical and autopsy material Indices of clinical pathology are left to the discretion of the hospital

8 Museum
There should be available fixed anatomic and pathologic specimens for study by the staff in proportion to the size of the hospital Properly filed and indexed color photographs may in part be substituted for museum specimens

9 Library
A reasonably complete library of modern books and recent unbound and bound journals should be available to the hospital and the more commonly used books and journals should be on hand in the laboratory

10 Educational program
The work of the person in training should be supervised Conferences, seminars, journal clubs, and demonstrations should be conducted as frequently as the volume of material and the size of the staff justifies A clinicopathologic conference must be held at least every 2 weeks

11 Volume of laboratory work
(*a*) As indicated in the following categories, no hospitals with less than 75 autopsies, 1000 surgical specimens and 25,000 tests in clinical pathology annually will be approved (Category D) except as outlined in the following paragraphs It is the belief of the board that less material than this is inadequate for the training of a pathologist

(*b*) In the field of clinical pathology, there should be a reasonable diversification of tests and in each category there should be sufficient absolute volume to provide training and experience There are no absolute criteria, but special scrutiny will be given to a hospital in which there is not a reasonable diversification and variety

(*c*) In the field of pathologic anatomy, a deficiency in either autopsies or surgical specimens may be made up by an excess of the other, if the deficiency does not exceed 20 per cent of the minimum required in the ratio of 1 autopsy to 75 surgical specimens Thus in a hospital approved for one year in pathologic anatomy and clinical pathology, the minimums are 75 autopsies and 1,000 surgical specimens If a hospital has 2 500 surgical specimens, it is acceptable if there are only 60 autopsies

If a hospital has met these minimal qualitative and quantitative standards, it will then, on the basis of the following quantitative standards, be approved for 1, 2, 3 or 4 years of training in pathologic anatomy, or clinical pathology, or both or some special field as shown for the number of residents indicated

CATEGORY A In both pathologic anatomy and clinical pathology for 4 years (as required of all candidates seeking certification in both fields who are examined after July 1, 1952)

Minimum 150 autopsies, 1750 surgical specimens, and 65,000 tests in clinical pathology for 4 residents Additional resident for each 50 autopsies or 500 surgical specimens, or 20,000 tests in clinical pathology

CATEGORY B In both pathologic anatomy and clinical pathology for 3 years This meets all requirements of the board for supervised training until July 1, 1952 Candidates examined after that date who seek certification in both subjects must take an additional year of supervised training in clinical pathology or pathologic anatomy, in another hospital, which is approved for the deficiency of training required

Minimum 125 autopsies 1500 surgical specimens, and 50,000 tests in clinical pathology for 3 residents Additional resident for each 50 autopsies, 500 surgical specimens, or 20,000 tests in clinical pathology

CATEGORY C In both pathologic anatomy and clinical pathology for 2 years Candidates taking two years in these institutions must have an additional year (2 years after July 1, 1952) in an institution in category A, B or D

Minimum 100 autopsies 1250 surgical specimens, and 40,000 tests in clinical pathology for 2 residents Additional resident for each 50 autopsies, or 500 surgical specimens, or 20,000 tests in clinical pathology

CATEGORY D In both pathologic anatomy and clinical pathology for 1 year Candidates taking training in these institutions must have an additional 2 years (3 years after July 1, 1952) in institutions which are approved for the deficiency of training required

Minimum 75 autopsies, 1000 surgical specimens and 25,000 tests in clinical pathology for 1 resident Additional resident for each 50 autopsies, or 500 surgical specimens, or 20,000 tests in clinical pathology

Category E In pathologic anatomy only, for 3 or more years Candidates taking all training in these institutions will not be eligible for certification in clinical pathology unless an additional year (2 years after July 1, 1952) is taken in clinical pathology in institutions which are approved for the deficiency of training required

Minimum 175 autopsies and 1500 surgical specimens for 3 residents Additional resident for each 50 autopsies or 500 surgical specimens

CATEGORY F In pathologic anatomy only, for 2 years Candidates taking training in these institutions will not be eligible for certification in clinical pathology unless they take one additional year full time in clinical pathology (2 years after July 1 1952) in institutions which are approved for the deficiency of training required and will be eligible in pathologic anatomy only if another year is taken in another institution which is approved for one or more years in pathologic anatomy

Minimum 125 autopsies and 1250 surgical specimens for 2 residents Additional resident for each 50 autopsies or 500 surgical specimens

CATEGORY G In pathologic anatomy only for 1 year Candidates training in these institutions will not be eligible in both pathologic anatomy and clinical pathology unless they take an additional year in pathologic anatomy and an additional year (2 years after July 1, 1952) in institutions which are approved for these periods of training Candidates seeking certification in pathologic anatomy only must study an additional 2 years in institutions which are approved for that period of training

Minimum 75 autopsies and 1000 surgical specimens for 1 resident Additional resident for each 50 autopsies or 500 surgical specimens

CATEGORY H For postmortem part of pathologic anatomy for 2 years Credit is never allowed for more than 2 years Candidates taking training in these institutions may pursue further training as follows 1 For pathologic anatomy only An additional year in an institution in Category A B, C, E, F or G with assignment to surgical pathology principally 2 For pathologic anatomy and clinical pathology An additional year (two years after July 1, 1952) in an institution in Category A B C, L, M or N with assignment to clinical pathology and ½ year assigned to surgical pathology principally in an institution in Category A, B C, or J

Minimum 125 autopsies for 2 residents An additional resident for each 60 autopsies

CATEGORY I For postmortem part of pathologic anatomy for 1 year Candidates taking training in these institutions may pursue further training as follows 1 For pathologic anatomy only An additional two years in an institution in Category A, B, C, E F or G with general assignments 2 For pathologic anatomy and clinical pathology An additional year (2 years after July 1, 1952) in an institution in Category A B, C L M or N with assignment to clinical pathology and 1 year to an institution in Category A, B, C, E, F or G

Minimum 75 autopsies for 1 resident

CATEGORY J Surgical pathology part of pathologic anatomy for 1 year Credit is never allowed for more than 1 year and the director of the laboratory must hold the certificate of the American Board of Pathology in pathologic anatomy or be eligible for certification Candidates training in these institutions may pursue further training as follows 1 For pathologic anatomy only An additional 2 years in an institution in Category H or in an institution of Category A B or C with assignment to postmortem pathology only 2 For pathologic anatomy and clinical pathology An additional year (2 years after July 1, 1952) in an institution in Category A, B, C, L, M or N with assignment to clinical pathology full time, and an additional year to an institution in Category A, B D E, F, G or H with assignment to postmortem pathology full time

Minimum 2000 surgical specimens for 1 resident An additional resident for each 1000 surgical specimens

Category K Special pathology as part of pathologic anatomy Credit for not to exceed ¼ the time credit (1 year if seeking certification in pathologic anatomy only 6 months if seeking both pathologic anatomy and clinical pathology) of candidates applying in pathologic anatomy may be taken in special laboratories with limited activities such as neuropathology, orthopedic pathology ophthalmic pathology, etc The candidate who receives credit in this category may, on request have the field of special pathology designated on the certificate of the board

CATEGORY L Clinical pathology for 3 or more years Candidates taking 3 years of training in these institutions will not be eligible for pathologic anatomy unless they take an additional 2 years in institutions approved for pathologic anatomy

Minimum 100 000 tests in clinical pathology for 3 residents Additional resident for each 50 000 tests

CATEGORY M Clinical pathology for 2 years Candidates taking 2 years training in these institutions must take the same additional training as in Category L to be eligible for pathologic anatomy also To be eligible for clinical pathology only, an additional year of clinical pathology must be taken in an approved institution

Minimum 75 000 tests in clinical pathology for 2 residents An additional resident for each 50 000 tests

CATEGORY N Clinical pathology for 1 year Candidates taking training in those institutions must take an additional 2 years in an institution in Category A, B, C, L or M assigned to clinical pathology for eligibility in clinical pathology only To be eligible in pathologic anatomy and clinical pathology, an additional 2 years in approved institutions is required

Minimum 50 000 tests in clinical pathology for 1 resident

CATEGORY O Special clinical pathology as part of clinical pathology Candidates applying for clinical pathology only may receive credit for not in excess of ¼ of the training period (1 year if seeking certification in clinical pathology only, six months if seeking both pathologic anatomy and clinical pathology) for work in a special field of clinical pathology) for work in a special field of clinical pathology, such as bacteriology serology, etc Under these circumstances on request the special field will be designated on the certificate of the board

CATEGORY P Research Residence in certain institutions in which full time is devoted to research with a direct application to the practice of pathologic anatomy or clinical pathology may be accepted for credit not to exceed one third the time requirement (20 months if no clinical internship 16 months if a clinical internship was taken) The board encourages research and believes that all candidates should carry on investigation during their training in all institutions Therefore this category is only for those wishing to do full time research

APPLICANTS FOR CERTIFICATES

Requirements for Applicants[1]—All candidates for examination for certification must meet the following requirements

1 Graduation from an approved medical school

2 One year of rotating or one year, pediatric or other internship in an approved hospital

3 Two years of specialized residency type training in an approved pediatric center

On May 1, 1946 it was ruled that at least one year of the two years of required residency training must be a full time pediatric in patient residency or internship in an approved institution Because of the shortage of residencies, the board at this time voted that temporarily the second year of required residency training might be met in the ways listed below, although the board recommends that whenever possible candidates complete the two years as regular residents

All applicants admitted to approved graduate or postgraduate courses in pediatrics on or after July 1, 1950 shall receive residency training credit for that number of months actually spent in full time attendance at such courses in excess of three months and up to a maximum of twelve months No credit shall be granted for part time graduate or postgraduate courses Courses of less than three months are credited only under special circumstances

(*a*) A maximum of three months credit each is allowed for full time residency type training in allied pediatric subjects, such as pediatric allergy, pediatric psychiatry, pediatric pathology, pediatric cardiology and newborn service

(*b*) A maximum of six months credit is allowed for residency training in an approved contagious disease hospital

4 A subsequent term of two years of specialized study or practice or a combination of the two Credit for one year toward this requirement is allowed for military service The maximum credit that any candidate may receive toward the practice requirement for work done prior to the completion of residency training is one year

Attention is invited to the fact that the primary duty of the resident must be the care of patients under supervision if full credit in satisfaction of the residency training requirement is expected Research residencies which involve little or no clinical training are creditable for only three months Research residencies which include significant clinical training may be prorated to a total of six months for a year of service Teaching fellowships may not be offered in lieu of residency appointments

Both research residencies and teaching fellowships are, of course, entirely acceptable in satisfaction of the practice or further study requirement Portions of a research residency not applicable for residency training credit may be carried over for practice credit

Preceptorships are not accepted for credit toward the residency requirement, but are accepted toward the practice requirement

The board defines service in a pediatric center as full time devoted to rounded experience in an approved hospital which includes ward and outpatient service experience with newborn including prematures, and both therapeutic and preventive pediatrics It is expected also, that the service will include adequate graduate training in the basic medical sciences as well as in the clinical laboratory and public health aspects of the specialty The time served in pediatric centers need not be continuous or spent in the same institution

---

[1] To avoid misunderstanding, the board advises all candidates to communicate with the office of the executive secretary before entering on training

EXAMINATIONS

Examinations will be held at or near the time and place of meetings of the American Academy of Pediatrics, and at other times and places at the discretion of the board, depending on the number of applicants from any region of the country It is proposed to arrange examinations in different cities so that as little financial burden as possible will be placed on the applicants in meeting the examiners

The purpose of these examinations is to determine the applicant's competency to practice pediatrics This board feels that the best impression of an applicant's ability can be obtained by oral examination, although a written test is also given It precedes the oral examination by an unfixed interval The written examination is given locally under a monitor Case reports are not required The board feels that the clinical and abstract aspects of growth and development are fundamental parts of pediatric training

The application fee is $100

The full fee must be remitted with the application Refund will be made only if the applicant is refused an examination

Applicants who failed an examination become eligible for a second examination after a year has elapsed After a second failure another examination will be permitted in one year The fee for the second and third examination is $50 each

Before becoming eligible for a fourth examination a candidate must serve one year in a full time medical in patient residency in an approved institution He must then reapply as a new candidate and pay a new fee

No financial recompense of any kind is made to any members of the board except to cover traveling expenses to board meetings and examinations

Application must be made on special blanks which may be secured from the executive secretary These should be sent to the executive secretary well in advance of the date on which the candidate expects to be examined At date of publication, lists are filed approximately one year ahead No application will be accepted more than a year in advance of eligibility date

Letters from two competent pediatricians recommending each applicant must be sent to the executive secretary of the board These letters should not accompany the application, but should be sent directly to the executive secretary No member of the board, or official examiner, may recommend any applicant

A list of papers or books published must be sent in with the application blanks

Certificates granted are in no sense degrees, nor do they purport to confer on any person any legal qualification, privilege or license to practice pediatrics Neither does the board intend in any way to limit the activities of any licensed physicians It is merely attempting to standardize qualifications and to issue certificates to those who voluntarily comply with the requirements

INFORMATION ON CERTIFICATION IN ALLERGY BY THE AMERICAN BOARD OF PEDIATRICS

The American Board of Pediatrics, Inc , has established certification in allergy as a subspecialty of pediatrics

Certification in pediatrics by the American Board of Pediatrics is a prerequisite for certification in allergy Those who already hold certificates of the American Board of Pediatrics and who wish to be certified in allergy must make formal application to the executive secretary of the American Board of Pediatrics Those who are not yet certified in pediatrics and who desire certification in allergy as well should indicate this in their application to the board as examination in both subjects may be held at the same time

The application fee for certification in allergy will be $25 in addition to the application fee for pediatric certification

An Advisory Committee of Allergy has been appointed to act with the American Board of Pediatrics in all matters pertaining to the selection and examination of applicants for subspecialty certification This committee is identical with the Advisory Committee on Allergy of the American Board of Internal Medicine

The present members of the committee are

Robert A Cooke, Chairman, 60 East 58th St , New York
Harry L Alexander, St Louis
Leslie N Gay, Baltimore
W C Spain New York
Francis M Rackemann, Boston
Oscar M Schloss, 125 E 72d St , New York (pediatric representative)

The Advisory Committee on Allergy has outlined the requirements for applicants who desire examinations in the subspecialty of allergy as follows

1 Two years, full time, in a satisfactory allergy clinic and its hospital (including training, in both allergy and pediatrics), or

2 One year, full time, in the allergy clinic and its hospital, and two additional years of full attendance on such an allergy clinic and its activities or

3 Five years, full attendance, on such an allergy clinic and its activities or

4 Special training under qualified preceptors, solely or in combination with aforementioned types of training, and such other training as might be felt adequate to prepare an individual for the practice of allergy

The candidate must expect a searching examination in both the theory and practice of allergy This means that they must come prepared to do physical examinations on selected patients take histories do actual skin tests if called upon to do so and interpret them They must be prepared to discuss all details in diagnosis and treatment on the patients that have been assigned to them In addition, they may be called upon to discuss any theoretical question that the examiners may choose to bring up

It is further the opinion of the committee that clinics for such training should fulfil the following qualifications

1 They should be in hospitals that have been accepted by the Council on Medical Education and Hospitals of the American Medical Association and by the American Board of Pediatrics for training and certification in pediatrics and for residencies in pediatrics or medicine

2 The director of the Allergy Clinic shall be a diplomate certified in allergy by the American Board of Internal Medicine, or the American Board of Pediatrics

When accepted the diplomate will receive from the American Board of Pediatrics a certificate in allergy and will be listed as a *specialist in allergy*

Prospective applicants for certification in the subspecialty of allergy may apply to the executive secretary of the American Board of Pediatrics

AMERICAN BOARD OF PHYSICAL MEDICINE AND REHABILITATION

Walter J Zeiter, Chairman, Cleveland
William H Schmidt, Vice Chairman, Philadelphia
William Bierman, New York
Donald A Covalt, New York
Earl C Elkins, Rochester, Minn
Kristian G Hansson New York
O Leonard Huddleston, Santa Monica, Calif
A B C Knudson, Washington, D C
Richard Kovacs, New York
Arthur L Watkins, Boston
Robert L Bennett, Secretary Treasurer, 30 North Michigan Ave , Chicago 2

QUALIFICATIONS FOR ELIGIBILITY TO CERTIFICATON

Each applicant for admission to the examination shall be required to present evidence that he has met the following standards

GENERAL QUALIFICATIONS

A Satisfactory moral and ethical standing in the profession

B Membership in the American Medical Association or membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association (Exceptions to the foregoing qualifications shall be made by the American Board of Physical Medicine and Rehabilitation for good and sufficient reasons)

PROFESSIONAL QUALIFICATIONS

A Graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association

B Completion of an internship, preferably of the general rotating type, of not less than one year in a hospital approved by the same council

SPECIAL TRAINING

A A period of study after the internship of not less than three years in clinics, dispensaries, hospitals or laboratories recognized by the same Council and by the American Board of Physical Medicine and Rehabilitation as competent to provide a satisfactory training in physical medicine

B This period of specialized preparation shall include (*a*) graduate training in anatomy (including kinesiology and functional anatomy), physics (including radiation physics, electronics and medical instrumentation), physiology, pathology and other basic sciences which are necessary to the proper understanding of physical medicine, (*b*) an active experience of not less than two years in hospitals, clinics, dispensaries and diagnostic laboratories recognized by the Council and the American Board of Physical Medicine and Rehabilitation (*c*) the written and oral examinations, given by the American Board of Physical Medicine and Rehabilitation, shall include questions concerning the basic sciences, clinical practice and laboratory and public health problems as related to physical medicine

C An additional period of not less than two years of study and/or practice in physical medicine

METHOD OF EXAMINATION

Physical Medicine includes the diagnosis and treatment of disease by means of physical agents These physical agents include heat, water, electricity, ultraviolet and infra-red radiation and mechanical devices and agents (such as massage and therapeutic exercise)

Physical Medicine has been termed medical applied biophysics As now practiced the special field of physical medicine includes (1) the employment of physical agents in diagnosis (as in electrical tests for reaction of degeneration or in the cold pressor test), (2) the employment of physical agents in treatment (3) occupational therapy and (4) the physical rehabilitation of convalescent and disabled patients

The physician who specializes in physical medicine must have a thorough knowledge of the basic sciences as related to these subjects as well as clinical practice in the various phases of physical medicine

Written and oral examinations will be given which will assure the board that the applicant is thoroughly grounded in

A The basic sciences including

(*a*) Anatomy (including kinesiology and functional anatomy) Because of the importance of proper knowledge of the function of muscles in conjunction with the administration of therapeutic exercise and physical reconditioning of convalescent and disabled patients the applicant will be carefully examined concerning his knowledge in this field.

(*b*) Physics (including radiation physics electronics and instrumentation) Because physical medicine deals largely with the employment of physical agents in diagnosis and treatment, the applicant will be expected to be well informed concerning the fundamentals of medical physics He will be expected to be familiar with such subjects as the physics of heat, ultraviolet and infra red radiation and electricity (including the physics of low voltage currents and high frequency currents as employed in medicine) Because of the newer developments in medical electronics and medical instrumentation the applicant will be examined concerning these subjects

(*c*) Physiology The applicant will need to know the fundamentals of physiology especially the physiology of movement and the physiologic effects of the various physical agents employed in medicine

(*d*) Pathology A basic knowledge of pathology as related to physical medicine will be required and questions dealing with this subject will be included in the examination

(*e*) Other fundamental sciences The applicant will be examined concerning his knowledge of such subjects as biochemistry and bacteriology as related to physical medicine

B The clinical aspects of physical medicine including

(*a*) Thermotherapy The various clinical applications of heat and cold both locally and generally should be thoroughly familiar to the applicant

(*b*) Hydrotherapy The methods of employing hydrotherapeutic devices and procedures will be covered in the examination

(*c*) Electrotherapy Questions concerning clinical, diagnostic and therapeutic uses of the constant current, interrupted currents, sinusoidal and high frequency currents will be included in the examination

(*d*) Radiation therapy The applicant will be examined especially concerning the diagnostic and therapeutic uses of ultra violet and infra red radiation (Applicants will not be required to answer questions concerning the therapeutic applications of roentgen rays and radium which are not included in the field of physical medicine but in the field of radiology)

(*e*) Kinesitherapy Questions concerning the clinical uses of therapeutic exercise and massage will be included in the examination

(*f*) Occupational therapy The applicant will be expected to answer questions concerning the indications for, and clinical application of, various types of occupational therapy

(*g*) Physical rehabilitation Because of the importance of the understanding of the philosophy of convalescent reconditioning and rehabilitation of the seriously disabled person, the applicant will be expected to have a thorough knowledge of the modern developments in these phases of physical medicine

APPLICATION

The application form shall contain a record of the candidate s premedical and medical training as well as of internships, graduate study, hospital or dispensary staff appointments, teaching positions, membership in medical societies, medical papers published, and the names of three well known physicians to whom the board may write for professional and character references

The application shall also be accompanied by one recent signed photograph of the candidate mounted on the application and the registration and examination fee of $50, which fee will cover both the written and oral examinations (In case of rejection of application, this fee will be refunded with the exception of $10, which will be considered as a registration fee) An additional fee of $25 will be required when the certificate is issued

AMERICAN BOARD OF PLASTIC SURGERY

Louis T Byars, Chairman, St. Louis
William G Hamm, Vice Chairman, Atlanta, Ga
William Milton Adams, Memphis, Tenn
Gustave Aufricht, New York
Albert D Davis, San Francisco
S Milton Dupertuis, Pittsburgh
Frederick A Figi, Rochester, Minn
Paul W Greeley, Chicago
John W Kemper, Ann Arbor, Mich
William F MacFee, New York
James T Mills, Dallas, Texas
A Neal Owens, New Orleans
Wallace H Steffensen, Grand Rapids, Mich
Clarence R Straatsma, New York
Bradford Cannon, Secretary-Treasurer, 330 Dartmouth St, Boston 16
Estelle E Hillerick, Corresponding Secretary, 4647 Pershing Ave St Louis 8

REQUIREMENTS

GENERAL QUALIFICATIONS

1 Moral and ethical standing in the profession satisfactory to the board

The board, believing that the practice of 'fee splitting' is pernicious, leading as it does to a traffic in human life, will reserve the right to inquire particularly into any candidate's practice in regard to this question

2 Those whose activities are limited to the practice of plastic surgery

3 This board will accept as applicants for examination only those who are full citizens of the United States or Canada Notarized statements not original citizenship papers, attesting

C. M. E. Medical College 32779

to the fact of full citizenship in the United States or Canada must be furnished by foreign born applicants when the application is filed Such candidates must have at least two years of practice in plastic surgery in North America after completing the training required by the board

The board considers the requirements outline below to be minimal in attaining its purposes and encourages candidates to take advantage of broadening experience in other fields

Candidates must fulfill the requirements which are in force on the date of their examination

PROFESSIONAL REQUIREMENTS FOR QUALIFICATION

1 Graduation from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association, or graduation from a foreign school considered acceptable by this board

2 Completion of an internship of not less than one year in a hospital approved by the same Council, or what would constitute in the opinion of the board the equivalent of such training

3 Two years of postgraduate work in general surgery beyond the intern year as a resident or an assistant resident in an approved hospital, or a period of training gained elsewhere judged by the board to be the equivalent

4 Training in general plastic surgery in an acceptable residency[1] or preceptorship for an additional period of not less than two years, also be taken in an approved hospital,[1] or under auspices satisfactory to this board

For the time being, it is felt that too few residencies in plastic surgery exist to meet the training needs In certain instances the board will accept in lieu of the two required years training in an accepted approved residency, training in a preceptorship under a fully qualified plastic surgeon, when such preceptorship is properly organized and supervised to give the trainee adequate experience and training in plastic surgery of a well rounded nature Certain established preceptorships are given full approval New preceptorships will be given tentative approval in advance on presentation to the board by the preceptor of a well rounded plan of training In such instances the trainee will be required to keep a detailed record of his experience presenting this to the board at intervals of six months If the preceptorship is found to be adequate in scope, it will be transferred to the fully approved list

5 During these years of training following the internship year, a candidate must hold positions of increasing responsibility for the care and management of patients with surgical conditions When a candidate receives his training in more than one institution, it is equally imperative that he hold positions of increasing responsibility He must have sufficient operative experience to acquire surgical skill and judgment through the performance of surgical operations with a high degree of responsibility, but under circumstances providing adequate opportunity for consultation and advice

6 An additional period of not less than two years of practice in plastic surgery If a candidate elects to spend one or two additional years in approved training in plastic surgery, one year of such training will be credited toward the required two years of private practice if it can be demonstrated that the candidate held a position of increasing responsibility It is imperative that one year be in actual private practice in such instances

The above training may be taken as a resident in surgery and in plastic surgery in an approved hospital, or under a preceptorship offering equivalent training By the latter statement it is meant that one may secure the necessary and specified training as an assistant to an accredited surgeon providing suitable facilities for the education of the candidate are offered

The period of special training should emphasize the relation of the basic sciences—anatomy, pathology, physiology, biochemistry and bacteriology—to the application of surgical principles which are fundamental in all branches of surgery, and especially to plastic surgery In addition, the candidate must understand and be trained in the following subjects the care of emergencies, shock, hemorrhage, blood replacement, electrolyte and fluid balance, choice of anesthetics, chemotherapy, acidosis and alkalosis, narcotics and hypnotics and wound healing

IMPORTANT NOTE—The added requirement adopted by the board in July 1949, and which appeared in the Educational Number of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, September 3, 1949, top of page 81, stating that "After Jan 1, 1953, certification by the American Board of Surgery will be a prerequisite for eligibility for examination by the American Board of Plastic Surgery, has been revoked Certification by the American Board of Surgery is not necessary for those seeking certification by the American Board of Plastic Surgery

Because of vagaries of training, such as changes from one specialty to another, interims of military duty and other service to the country, the aptitude and skill of candidates, the board may, at its discretion, review and make recommendations for or against certification of certain applicants outside of the listed qualifications and requirements

The board reserves the privilege of requesting lists of operations done solely by the candidate for one or more years, or of requesting special and extra examinations, written, oral or practical, and of requesting any specific data concerning the candidate that may be deemed advisable before making final decision for certification

Eligibility rulings or an evaluation of a candidate's qualifications or training cannot be made by the secretary or by any one member of the board Official evaluations of qualifications are made only by the Committee on Credentials and Requirements, or by the entire board where necessary, after a review of the candidate's formal application for such rulings The applicant must allow at least four weeks for such requests to make the rounds of the committee

TRAINING FACILITIES

The American Board of Plastic Surgery, in cooperation with the Council on Medical Education and Hospitals of the American Medical Association and the American College of Surgeons, evaluates training facilities in institutions providing acceptable residencies in plastic surgery Neither the board nor its individual members can be responsible for the placing of applicants for training The board will give no independent approval and will keep no independent list of approved residencies or preceptorships The board will consider those residencies approved by the Council on Medical Education and Hospitals of the American Medical Association as acceptable facilities for training in plastic surgery

It should be kept in mind by all that the primary interest of the board is to encourage well rounded training in plastic surgery with the aim of producing plastic surgeons capable of doing good work in the wide variety of cases which may come under their care The standards set up by the board, both for preliminary general surgery and for specialized plastic surgery training, are established in an effort to further this aim The quality of the training received should be reflected in the candidate's ability to achieve good results in his practice and the examinations of the board are an attempt to judge the ability of the candidate in the specialty of plastic surgery

SUGGESTIONS FOR TRAINING IN PLASTIC SURGERY

A residency in plastic surgery is one in which a hospital appointment for training in plastic surgery is given the trainee In a preceptorship in plastic surgery no such appointment is given

While the board permits flexibility in training, approved residencies and preceptorships should be under fully qualified plastic surgeons Those trained in preceptorships will be judged by the candidate's ability to make the most of his training and to show adequate ability in all phases of the subject

There must be teaching in either a residency or a preceptorship—instruction in the basic sciences and in the basic principles of plastic surgery—if not in actual courses, then by conferences, ward rounds, lectures by men on the service or other services, or by visiting doctors

A resident or assistant resident in plastic surgery should have a full time appointment from an A M A Council approved hospital or hospitals A preceptee does not have such an appointment A residency should preferably be in connection with a teaching hospital having medical school affiliations or be under the Dean's Committee of Veterans Administration hospitals An acceptable residency is one that is approved by the Council on Medical Education and Hospitals of the American Medical Association

---

[1] An acceptable residency is one which has been approved by the Council on Medical Education and Hospitals of the American Medical Association

Before training in plastic surgery is begun, the plastic surgeon in charge of the residency or preceptorship should ascertain that the trainee's preliminary training in general surgery meets the requirements of the board, that is two years of residency training in general surgery after the internship year

The training in plastic surgery (at least two years) whether in a residency or a preceptorship, should cover a wide field of plastic surgery, both as to type and anatomical distribution There should be available sufficient material of a diversified nature so that the trainee will be able to pass the examinations of the board after the period of training and the two additional years of private practice If the available material on one service is inadequate, the deficiency should be made up by affiliation with another plastic surgeon on another service so that a broad experience will be obtained in plastic surgery The trainee should be provided an opportunity to operate under the direct supervision of the plastic surgeon in charge, and with increasing ability to be given an opportunity to operate independently on suitable cases under more remote supervision

It would be well for a preceptor to report annually to the board the name and qualifications of any preceptee under his supervision, as well as the work done by the preceptee The preceptee should report to the board every six months the number and type of operations performed both under supervision and independently, giving details of supplementary activities of his training

MILITARY CREDIT

Credit for military service is given on an individual basis, each case being considered on its own merits and the amount of credit allowed is determined by the board when the information is submitted with the application

CASE REPORTS

On approval by the board of a candidate's application for certification, each candidate is required to submit to the board thirty five or more case reports illustrative of his independent work in the field of general plastic surgery These case reports shall conform to conditions which the board may from time to time specify and the case reports must be approved by the board before the candidate is admitted to examination

The thirty five case reports must be of a diversified nature and must be submitted to the office of the board, together with photographs The group must include a variety of material from the entire body rather than a number of cases of one type, and should carry the candidate's personal deductions, conclusions and comments and should be sufficiently detailed to show if the conclusions drawn indicate a grasp of the subject and if the results justify the procedure

Each case report should be typewritten on paper approximately 8½ x 11, separately numbered and paged with the candidate's name on each page Each report should be individually assembled and held by removable fasteners and should have a cover sheet with the candidate's name, the number of the case, hospital number, diagnosis and a brief summary of the case (not over 100 lines) The case reports, photographs and other data are to be filed with the permanent records of the board

Cases should be chosen from the private practice of the candidate or from the hospital or clinic service The initials, color, age and occupation of each patient should be stated, as should the name of the hospital where treated and dates of admission, operation and discharge The important details of family history, if relevant, and of the previous history should be given The history of the condition for which the patient consulted candidate should be stated clearly and concisely, indicating previous treatment, if any, and the mental, social or economic factors involved The physical examination of the patient with special reference to the existing deformities should be carefully described All laboratory and other special examinations, such as roentgenograms which were made, should be reported, with a statement of what was determined by them The indications for operation and for the type of operation employed should be given, and the preliminary treatment and the type of anesthesia used should be stated A full description of the operative technic with methods of hemostasis, suture and drainage, if any, and the name of the assistant should be given The late and early postoperative course and results should be described Photographs of conditions and drawings of operative technic, illustrative of each case should be included and securely attached to each case report, with the name of the candidate and the number of the case indicated Before and after photographs should be shown, and all photographs should be made by a sharp focus lens from untouched negatives with identical lighting conditions, exposure and developing, and should show conditions before and after operation with clear detail

If the case reports, and lists of operation when requested, are approved, the candidate will receive subsequent information regarding taking the examinations The board at its discretion may request certification of case reports by the hospital where the operations were performed The following form should accompany the case reports I hereby certify that the planning and essential surgical procedures described herein were carried out by me as an independent operator'

A candidate should remember that these case reports are documentary evidence of his ability and that the material in them and the manner of presentation are important evidences of his ability

EXAMINATIONS

The qualifying examinations are divided into two parts, the written examination, and the oral and practical examinations

The examinations are given twice yearly, in the spring and fall The spring examination is given immediately preceding, during or following the annual meeting of the American Association of Plastic Surgeons (usually in May), and the fall examination is given immediately preceding, during, or following the annual meeting of the American Society of Plastic and Reconstructive Surgery (usually in October) Candidates are required to go to the designated center for the qualifying examination, which lasts three days These centers will be the city in which the meetings of these two organizations are held if the proper clinic and hospital facilities are available, otherwise in some nearby city where such material is available Arrangements for all examinations are made by the Examintion Committee

The written examination will consume all of the first day and half of the second day The oral and practical examination will consume the afternoon of the second day and all of the third day The subjects of the written examination are (1) theory and practice of plastic surgery, (2) applied anatomy, applied physiology, (3) pathology, bacteriology, clinical laboratory methods, pharmacology, (4) reaction of tissue to injury, surgical accidents, anesthesia

A general oral examination pertaining to plastic surgery will be given In the practical part of the examination, the examiners will present a group of patients for examination by the candidates, and the candidates will be quizzed on methods of procedure—diagnosis, treatment, technic, and so on Slides of preoperative conditions will be shown on a screen and the candidate asked to make a quick diagnosis of the items and tabulate in the order of their importance and methods of treatment Microscopic slides of the average pathological tissue falling within the province of the plastic surgeon will be given the candidates on which they will be asked to write a description and diagnosis

Either prior to or following the examination, the candidate will be visited at his place of practice by a member or members of the board to observe him operate and to examine a number of his pre and postoperative cases

To be considered as passing, the candidate will be required to receive a grade of at least 65 per cent in each portion of the written examination and an average of 75 per cent on the entire written and oral examination

REEXAMINATIONS

Candidates who have failed in any portion of the examination may be admitted to another examination after one year, or within three years, except in such cases as the board may for good and sufficient reason deny a candidate the privilege of reexamination The candidate must give sixty days notice requesting a reexamination and pay a fee of $25 00 for the written reexamination and $25 00 for the oral and practical examination The examiners conducting the first examination will not be eligible to conduct the reexamination

FEES

The fee for application and examination is $150 Of this sum, $25 must accompany the application and the remaining $125 must be paid when the candidate is notified of acceptance for examination There will be no refunds This fee may be increased at the discretion of the board The board is a nonprofit organization and the fees of candidates are used solely for defraying the actual expenses of the board The members of the board serve without remuneration Because of the limited number of surgeons certified by this board it is necessary for a while to request a voluntary annual prorata contribution from diplomates after the first year's certification to defray expenses of the board

CERTIFICATOIN

After a candidate has met the requirements for eligibility and passed the examinations of the board, a certificate attesting his qualifications in plastic surgery will be issued to him by the board, signed by its officers, and having the seal of the board affixed thereto It shall be the prerogative of the board to determine the fitness professionally and ethically of any candidate for its certificate, and the action or decision of the board regarding the certification of any candidate shall be final

The board is in no sense an educational institution and the certificates of the board are not to be considered as degrees Therefore the certificate does not confer on any person legal qualifications, privileges, or license to practice medicine or the specialty of plastic surgery The board does not purport in any way to interfere with or limit the professional activities of any licensed physician nor does it desire to interfere with any practitioners of medicine in any of their regular or legitimate activities

The American Board of Plastic Surgery has never been concerned with measures that might gain special privileges or recognition for its certificants in the practice of plastic surgery It is neither the intent nor has it been the purpose of the board to define requirements for membership on the staffs of hospitals The prime object of the board is to pass judgment on the education and training of broadly competent and responsible plastic surgeons—not who shall or shall not perform plastic surgical operations The board specifically disclaims interest in or recognition of differential emoluments that may be based on certification

AMERICAN BOARD OF PREVENTIVE MEDICINE AND PUBLIC HEALTH

Walter L Bierring, Chairman, Des Moines Iowa
Felix J Underwood, Vice Chairman, Jackson, Miss
Gaylord W Anderson, Minneapolis
J H Baillie, Toronto, Canada
Floyd C Beelman, Topeka, Kan

CONSULTANTS

Col Don Longfellow (Army)
Capt Robert W Babione (Navy)
Col Fratis L Duff, (Air Force)
Edwin F Daily (Children's Bureau)
Eugene A Gillis (Public Health Service)
George R Callender (Veterans Administration)
Basil MacLean, Rochester, N Y

GENERAL QUALIFICATIONS

1 Good moral character and high ethical and professional standing

2 Graduation from a medical school in the United States or Canada approved by the Council on Medical Education and Hospitals of the American Medical Association, or from a foreign medical school satisfactory to the board

3 An internship of at least one year in a hospital approved by the Council on Medical Education and Hospitals of the American Medical Association or in a foreign hospital satisfactory to the board

4 Licensure to practice medicine in the United States or the Dominion of Canada

5 Special training in preventive medicine or public health which shall include

- (a) A period after internship of not less than six years of special training, teaching or practice in preventive medicine and public health which must include (b) and (c) Credit for training and experience in preventive medicine and public health while on military duty will be considered on an individual basis depending on type of service
- (b) Successful completion of at least one academic year of graduate study leading to the degree of Master of Public Health or an equivalent degree or diploma or an equivalent satisfactory to the board
- (c) Residency[1] (after internship) of at least two years of field experience in general public health practice which included planned instruction, observation and active participation in a comprehensive, organized public health program, one year of which may be an approved clinical residency in a field directly related to public health

6 Limitation of practice to full time teaching or practice of preventive medicine or public health as a specialty

7 Membership in appropriate medical and specialty associations The American Medical Association, the American Public Health Association

APPLICATIONS

Each application for examination must be made on the prescribed form (which may be obtained from the secretary) and be accompanied by the required documentation, and must be filed with the secretary, ordinarily not less than ninety days prior to the date of the examination The application must be accompanied by an application fee and two recent, clear, unmounted, autographed photographs of the applicant, one of which should be attached to the application and the other unattached

FEES

The fee for application and examination is $90, payable as indicated below, additional fees are payable for reexamination

Application fee, $15 No application will be considered unless accompanied by the application fee The application fee is not refundable

Certification fee, $75 This fee is payable when the candidate is notified of acceptance for examination or reexamination, and, if paid prior thereto, is not refundable after such notification has been given No member of the board is authorized to give informal opinions as to the eligibility of the candidates The determination of eligibility will be made only by the board after receiving full application information Each candidate must comply with board regulations in effect at the time the examination is taken, and also those in effect at the time the certificate (if any) is issued, regardless of when the original application was filed An applicant declared ineligible for admission to examination may refile or reopen his application on the basis of new or additional information within two years of the filing date of his original application without payment of an additional application fee Applicants declared eligible but who fail to exercise the examination privilege within three years of the filing of the application are required to file a new application and to pay a new application fee

---

[1] Approval of residency training is in the process of development by the Council on Medical Education and Hospitals of the American Medical Association in cooperation with the American Public Health Association Until such time as an adequate program of residency is developed field training will be evaluated on an individual basis Information as to approved residencies may be obtained from the Council on Medical Education and Hospitals or from the secretary of the board

EXAMINATIONS

Examinations will be held from time to time and in various places depending on the need as indicated by applications received It is expected that examinations will be held primarily in connection with the meetings of the American Public Health Association For the convenience of military personnel assigned overseas the board will try to provide for special individual examinations at times when such officers are temporarily returned to the United States The examination consists of two parts

Part one is a comprehensive written examination designed to test the knowledge of the applicant in the general field of preventive medicine and public health

Part two is an oral or practical examination which will usually be held on the day following the written examination An endeavor will be made to adapt the details of the oral examination to each candidate s experience and practice The examiners will report on each candidate to the assembled board, by which the results of the examination will be considered

REEXAMINATION

Candidates failing the first examination taken may, upon timely request, be admitted to a second examination within eighteen months following the examination failed, upon payment of an additional fee of $15 If the candidate fails the second examination, a period of eleven months must elapse before admission to a third examination A fee of $25 is required for admission to the third examination Candidates failing three examinations will not be admitted to any subsequent examinations unless the board so directs

CERTIFICATION

On satisfactory completion of the examination and proof to the satisfaction of the board that the applicant is eligible for certification, a certificate will be issued to the effect that the person named has been found to be possessed of special knowledge in preventive medicine and public health The certificate will be signed by the officers of the board and shall have its seal affixed Each certificate remains the property of the board, but the person to whom it is issued shall be entitled to its possession unless and until it is revoked Any certificate issued by the board may be revoked if evidence, satisfactory to the board is presented that the applicant was not eligible to receive it at the time of examination or issuance, or that he misstated, misrepresented or concealed any pertinent fact, or that his license to practice medicine has been suspended or revoked, or that he has ceased to be engaged in the teaching or practice of preventive medicine or public health as a specialty The issuance of a certificate to any person does not constitute such person a member of the board

AMERICAN BOARD OF PROCTOLOGY

Curtice Rosser, President, Dallas, Tex.
George H Thiele, Vice President, Kansas City, Mo
Garnet W Ault, Washington, D C
Harry E Bacon, Philadelphia
Walter A Fansler, Minneapolis
Louis J Hirschman, Detroit
Louis E Moon, Omaha.
Marion G Pruitt, Atlanta, Ga
R A Scarborough San Francisco
Louis A Buie, Secretary, 102-110 Second Ave, S W, Rochester, Minn

TYPES OF CERTIFICATION

An application for certification is a voluntary act. Two types of certification will be offered until Jan 1, 1955 Certificates will be issued (1) to those who fulfil requirements for certification as specialists in the diagnosis and treatment of anorectal diseases exclusive of those conditions which require surgical operation within the abdomen and those which require radical operation for malignant diseases of the rectum, and (2) to those who fulfil requirements for certification as specialists in the diagnosis and treatment of anorectal and colonic diseases It is important to repeat that the essential difference between the two types of certification is that diplomates of the first type will not be certified to administer treatment which requires surgical operation within the abdominal cavity nor to perform radical operations for malignant diseases of the rectum, while diplomates of the second type will be certified to administer such treatment or perform such operations After Dec. 31, 1954, the first type of certification will be discontinued

QUALIFICATIONS

This board does not intend to interfere with any practitioner of medicine in his legitimate activities but wishes only to certify, in so far as possible, to the public that physicians who claim to be specialists in proctology possess proper qualifications Suitable evidence of such qualifications can be obtained only if a physician can satisfy this board concerning his training and can thereafter pass examinations required for certification

Article VIII of the by-laws of the American Board of Proctology, which follows, is quoted verbatim, in order that there will be no doubt in the minds of applicants whether their qualifications meet the standards of the board

ARTICLE VIII APPLICATION FOR CERTIFICATES

Section 1 Each application for a certificate shall be filed with the secretary on the prescribed form and shall be accompanied by the designated fee It shall also be accompanied by an unmounted autographed recent photograph of the applicant and by names of two proctologists acceptable to, but not members of the board, who may be referred to for information in regard to the applicant

Section 2 General qualifications which the applicant must possess

(*a*) High ethical and professional standing
(*b*) Authorization to practice medicine in the country, state, territory or province of his residence
(*c*) Membership in the American Medical Association or the corresponding medical association of the country in which he resides
(*d*) One year of internship in a hospital acceptable to the Council on Medical Education and Hospitals of the American Medical Association, following completion of a four year course in a Class A medical school

Section 3 Special qualifications for applicants who desire certification in anorectal surgery only (this type of certification does not include operations within the abdominal cavity or radical surgical operations for malignant disease of the rectum and will be discontinued after Dec 31, 1954)

(*a*) A period of three years graduate training, after internship, in clinics, dispensaries, hospitals or laboratories approved by the Council on Medical Education and Hospitals of the American Medical Association and the American Board of Proctology as competent to provide satisfactory training in proctology and the principles of general surgery This specialized training shall include graduate training in the basic sciences according to the standards prescribed by the Council on Medical Education and Hospitals of the American Medical Association and by this board In individual instances credit may be granted for work done in preceptorships approved by this board and also for military service
(*b*) An additional period of not less than two years of training or practice limited to proctology
(*c*) Evaluation of examinations which shall include the basic medical sciences and the clinical, laboratory and public health aspects of proctology

Section 4 Special qualifications for applicants who desire certification in both anorectal and colonic surgery

(*a*) A period of five years' graduate training after one year of internship Three years of this period shall have been spent in training in general surgery and the basic sciences in clinics, dispensaries, hospitals and laboratories approved by the Council on Medical Education and Hospitals of the American Medical Association and the American Board of Proctology Two years additional training as a full time resident in proctology shall be acquired by the applicant in proctology In individual instances, credit may be granted for work done in general surgery or proctology in preceptorships approved by this board, and also for military service (*b*) This training shall be evaluated further by examination which shall include the basic medical sciences as well as the clinical, laboratory and public health aspects of abdominal, intestinal, rectal and anal surgery

Section 5 Those applicants who have been graduated from a Class A medical school for more than ten years and who wish certification in anorectal surgery only shall be required to submit to the American Board of Proctology satisfactory evidence of training and experience in proctology, together with evidence of superior achievement in the ethical practice of this specialty They shall furthermore be required to pass suitable examinations in the subject and to submit, if thought advisable by the board, hospital case reports or demonstrate their competency to representatives of the board This method of certification shall terminate Sept 3, 1951

MILITARY CREDIT

Physicians who were on active duty in the armed forces for one year or more and who entered the service prior to Aug 15, 1945, will be given one year of credit The board may allot additional credit if the candidate furnishes evidence of suitable surgical service under acceptable supervision No credit in excess of two years will be allowed

APPLICANTS TRAINED IN FOREIGN COUNTRIES

Applicants must hold a license to practice medicine or surgery in the country in which they reside or hold citizenship, and they must have fulfilled all other requirements

GENERAL REQUIREMENTS

1 All candidates shall comply with current regulations of the board regardless of the time of filing applications The secretary is not permitted to make decisions as to requirements These rulings are made by the Committee on Standards and Requirements or by the board after reviewing the candidates' formal applications

2 All candidates shall have limited their practice to proctology

3 Application forms shall be filled out completely and accurately It is to the advantage of the applicant to supply letters of endorsement

4 A fee shall be remitted in the following manner Twenty-five dollars with the application blank and when the candidate is notified that he is acceptable for examination, he shall remit the examination fee, which is $150 for candidates in proctology and $100 for candidates in anorectal surgery

5 All candidates shall appear personally before the board

6 All candidates shall submit to the required examinations

7 Applicants may be requested to deliver to the board a record of all patients hospitalized during the year prior to the date of submission of his application Each record shall be endorsed by an appropriate official of the hospital and must include dates of admission and discharge from the hospital, the diagnosis, treatment and result

8 Candidates shall submit a bibliography of papers and books published

EXAMINATIONS

Part I shall consist of written and oral examinations covering the theory and practice of proctologic surgery, applied anatomy and physiology, pathology, bacteriology, clinical laboratory methods, and allied subjects

Part II shall consist of a clinical examination including (1) examination of patients, (2) gross and microscopic pathology and (3) roentgenologic interpretation

The examinations will be held at times and places which will be determined by the board and will be announced in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION All applications must reach the office of the secretary at least sixty days prior to the time set for the examination and all candidates who are eligible will be notified at an appropriate time

GRADES AND REEXAMINATIONS

An average of 75 per cent is the minimum grade which will be acceptable to the board for certification of a candidate

If a candidate should fail in Part I, he will be required to wait one year before he may be reexamined

If a candidate should pass Part I and fail Part II, he must wait a year before being allowed a reexamination in Part II

If a candidate should fail the reexamination in Part I or Part II, he will be required to submit a petition to the board With such a petition, the candidate must submit satisfactory evidence of further substantial preparation The board may approve of another reexamination or it may deny such privilege

A fee of $50 will be charged for the second reexamination in Part I or Part II

CERTIFICATION

A certificate which attests to the candidate's qualifications will be awarded to those who have met the requirements for eligibility and have passed the examinations with a grade of 75 per cent or better

Each diplomate shall be required to pay a fee of $10 annually to the board for a period of ten years following the year of his certification

The certificate granted by the board does not confer on any physician legal qualification, privilege or license to practice proctology Neither does it limit the activities of any licensed physician It attempts to standardize qualifications and to issue certificates to those who comply voluntarily with the requirements Probably the greatest value of the certificate lies in the fact that it provides the medical and lay public a partial measure whereby they may select physicians who are well qualified in this specialty

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY

S BERNARD WORTIS, President, New York
KENNETH E APPEL, Vice President, Philadelphia
BERNARD J ALPERS, Philadelphia
PERCIVAL BAILEY, Chicago
KARL M BOWMAN, San Francisco
RUSSELL N DEJONG, Ann Arbor, Mich.
ROLAND P MACKAY, Chicago
FREDERICK P MOERSCH, Rochester, Minn.
GEORGE N RAINES, Washington, D C
GEORGE H STEVENSON, London, Ontario
PAUL I YAKOVLEV, Middleton Conn
FRANCIS J BRACELAND, Secretary-Treasurer, Institute of Living, 200 Retreat Ave, Hartford 2, Conn
DAVID A BOYD JR., Acting Secretary Treasurer, 102 110 Second Ave, S, Rochester, Minn

APPLICATION FOR CERTIFICATES

An application, in order to be considered at any meeting of the board, must be in the hands of the secretary of the board not less than ninety days before the date of such meeting. A proper application form may be obtained from the secretary Application may be made for certification in psychiatry or in neurology or in both fields Applications will be formally considered only when made on the official application blank in such form as may be adopted from time to time by the board and when accompanied by an application fee in such amount as may be fixed by the board

The secretary of the board, on receipt of an application, shall forthwith make inquiries from those to whom the candidate refers and from such other persons as the secretary may deem desirable and shall verify the candidate s record from the biographical records of the American Medical Association, after which he shall forward the application to the Committee on Credentials This committee shall consider the application and other information available and notify the secretary whether the application is accepted The certification of a candidate in either psychiatry or neurology, or both shall be approved by a majority of the members of the entire board at a meeting held for such certification

FORM OF CERTIFICATION

There shall be separate certification in psychiatry and in neurology and two certifications or a combined certification for those qualified in both fields The certifications shall be in such form as is approved by the Board of Directors

GENERAL REQUIREMENTS FOR APPLICANTS

Each applicant for a certificate must establish that

(*a*) He is a physician duly licensed by law to practice medicine

(*b*) He is of acceptable ethical and professional standing (*c*) He is now a member of the American Medical Association or a member of such medical societies as are recognized for purposes of certification by the Council on Medical Education and Hospitals of the American Medical Association Exceptions to the foregoing may be made at the discretion of the board for good and sufficient reasons

(*d*) He has received adequate training in psychiatry or neurology, or both, as a specialty

CLASSES OF APPLICANTS

Class A—Applicants who graduate from an approved medical school before the foundation of the board (1934) will not be held to the strict interpretation of the published requirements in formal graduate training Under such circumstances the board will consider the training and experience of the applicant and decide whether or not he will be admitted to the examination

Class B—Applicants who graduated from an approved medical school after 1934 shall fulfil the following requirements

PROFESSIONAL EDUCATION

1 Graduation from a medical school in the United States or Canada approved by the Council on Medical Education and Hospitals of the American Medical Association In the case of an applicant whose training has been received outside the United States and Canada, such training must be satisfactory to the aforementioned Council

2 Completion of a year s internship approved by the same Council in general medicine, general surgery, pediatrics or a rotating internship

3 The nine month wartime internships will be accepted as an equivalent of one year

SPECIALIZED TRAINING

Admission to the examination for certification in psychiatry or neurology requires a total of five calendar years of training and experience, three years of which must be specialized training obtained in approved training centers plus two years of experience Admission to the examination for certification in both psychiatry and neurology requires a total of six calendar years of training and experience, five years of which must be specialized training obtained in approved training centers, plus one year of experience The specialized training may be subdivided into two and one half years each in psychiatry and neurology or three years in one subject and two years in the other The required years of experience should be spent in clinical practice with major responsibility for the care of patients

This training for psychiatrists should include clinical work with psychoneurotic and psychotic patients, combined with the study of basic psychiatric sciences medical and social psychology, psychopathology psychotherapy and the physiological therapies, including a basic knowledge of the form, function and pertinent pathology of the nervous system This training should be supervised and guided by teachers competent to develop skill and understanding in the utilization of such basic knowledge in dealing with patients Mere factual knowledge is not sufficient This training period should include instruction in the psychiatric aspects of general medical and surgical conditions and the behavior disorders of children and adolescents sufficient to develop practical ability to direct the treatment of such conditions It should also include collaborative work with social workers, clinical psychologists, courts and other social agencies The training program of the candidate for certification in psychiatry should include sufficient training in neurology to enable him to recognize and to evaluate the evidences of organic neurological disease

The training for neurologists should be based on clinical work with adults and children with neurological disorders including the neurological complications of medical and surgical conditions This shall be combined with study of basic neurological sciences neuroanatomy neurophysiology neuropathology and neuroroentgenology This training should be supervised and guided by teachers competent to develop skill and understanding in the utilization of such basic knowledge in dealing with patients Mere factual knowledge is not sufficient. This training should include sufficient training in psychiatry to enable the candidate to recognize and to evaluate the common psychiatric reactions.

The board offers the foregoing two paragraphs as an outline of desirable training If however, the candidate has evidence of equivalent qualifications of training and experience not in the pattern here formulated, this experience with appropriate documentary support may be included in his application for evaluation and possible approval by the board

Candidates seeking certification in both neurology and psychiatry or supplementary certification in one after being certified in the other must submit evidence satisfactory to the board of an additional two years of full time basic training in the supplementary specialty

Thus, no candidate is eligible for examination by the board until he has completed at least five years of special training and experience in neurology or psychiatry for a single certificate or at least six years of special training and experience in neurology and psychiatry for certification in both neurology and psychiatry

The board will give not more than six months of credit for not less than six months of training in an approved training center for internal medicine or pediatrics in lieu of six months of experience to candidates for the certificate in psychiatry or neurology, but not to candidates for certification in both psychiatry and neurology

The board will give credit for one year of training in child psychiatry provided it is the third year of the required three years of special training required by the board and providing it is taken in a center approved by this board for training in child psychiatry

The lists of training programs approved by this board and by the Council on Medical Education and Hospitals of the American Medical Association may be found in the current issue of the Educational and Internship and Residency numbers of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

The secretary may at his discretion admit to examination candidates who lack not more than two months of the time requirement for certification with the understanding that the certificate will in no case be issued until satisfactory written evidence of completion of this requirement is submitted to the board

TRAINING IN THE ARMED FORCES

Credit will be granted for one year of wartime military service in the Army, Navy, Public Health Service and Veterans Administration Wartime to this board means Dec. 7, 1941 to Feb 15, 1946 Further credit for specialized training will be granted only if the candidate has received training in an institution recognized by the Council on Medical Education and Hospitals of the American Medical Association and approved by this board Time beyond one year spent in the above government agencies may be credited to experience providing the candidate has been regularly assigned to a service in neurology or psychiatry

EXAMINATIONS

Date and places of examinations are set by the board at its discretion and shall be announced in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION in the *American Journal of Psychiatry*, in the *Journal of Nervous and Mental Diseases* and in the *Archives of Neurology and Psychiatry*

The examinations are designed to test the competence of the candidates The board requires some proficiency in neurology on the part of those it certifies in psychiatry, and vice versa, but examines the candidate in accordance with the certificate he seeks The examinations will be of such type that no adequately trained person will fail and yet they will be sufficiently searching so that the specialist in fact may be separated from the specialist in name The practical examination will include the examination of patients under the supervision of the examiner The manner of examining patients and the reasoning and deductions therefrom, will constitute an important part of the examination Oral and practical examinations will be given in the basic sciences with special regard to their clinical implications Written examinations may be given at the discretion of the board The examination for certification in psychiatry will differ from the examination for certification in neurology

PAYMENT OF FEES

The candidate on filing his application shall accompany it with an application fee of $25 which is not returnable If a preliminary written examination has been decreed, an additional $25 fee will be required at the time of the applicant s acceptance. When notified by the secretary that he is eligible for the oral and practical examination, the candidate shall send to the secretary an examination fee of $50 A candidate who has been certified in either psychiatry or neurology and who has been admitted to supplementary examination for the other certificate shall pay an additional examination fee of $50

A candidate who has failed in one examination is eligible for reexamination within one year on payment of a reexamination fee of $25 After the year has elapsed he must submit a new application and pay new application and examination fees If he fails the reexamination, he may, after two years have elapsed, submit a new application and $25 fee, present evidence of further training and pay an examination fee of $50

A candidate who fails in one or two subjects is eligible for reexamination in those subjects within one year on payment of a reexamination fee of $25 After the year has elapsed he must submit a new application and pay new application and examination fees and repeat the entire examination If he fails the reexamination, he may apply again for the complete examination after two years on submission of evidence of further training and on payment of an application fee of $25 If admitted to the examination, he must pay a new examination fee of $50

Any candidate who finds himself unable to attend an examination to which he has been admitted and does not notify the *secretary at least six weeks before the date of the examination* will forfeit half of his examination fee Any candidate who fails to appear for examination within a period of three years following the date of notification of eligibility for examination shall be required to submit a new application and pay the attendant fee If a candidate dies before his certificate is issued, all fees will be returned to his estate

AMERICAN BOARD OF RADIOLOGY

I H Lockwood, President, Kansas City, Mo
Douglas Quick, Vice President, New York
Ralph S Bromer, Bryn Mawr, Pa
Ray A Carter, Los Angeles
D S Childs, Syracuse, N Y
A H Dowdy, Los Angeles
Ross Golden, New York
E L Jenkinson, Chicago
H Dabney Kerr, Iowa City
F W O'Brien, Boston
J W Pierson, Baltimore
U V Portmann, Cleveland
Leo G Rigler, Minneapolis
B P Widmann, Philadelphia
B R Kirklin Secretary Treasurer, 102-110 Second Avenue S W, Rochester, Minn

CERTIFICATES

A certificate will be issued to each candidate who meets the requirements of the board, to the effect that the holder of the certificate has had adequate training in radiology and has successfully fulfilled the requirements of the board

A certificate granted by this board does not of itself confer or purport to confer, any degree, or legal qualifications, privileges or license to practice radiology Certificates of the board shall be issued on one of two forms

1 A certificate to the effect that the applicant has been found qualified to practice radiology in all its branches

2 A certificate to the effect that the applicant has been found qualified to practice radiology in one or more of the following special fields (*a*) roentgenology, (*b*) diagnostic roentgenology, (*c*) therapeutic radiology

3 A certificate to the effect that the applicant has been found qualified to practice radiological physics in all of its branches

4 A certificate to the effect that the applicant has been found qualified to practice radiological physics in one or more of the following special fields, (*a*) x-ray and radium physics, (*b*) medical nuclear physics

DEFINITIONS

For the purposes of this board, the following definitions are adopted

1 Radiology is that branch of medicine which deals with the diagnostic and therapeutic application of radiant energy including roentgen rays and radium

2 Roentgenology is that branch of radiology which deals with diagnostic and therapeutic application of roentgen rays

3 Diagnostic roentgenology is that branch of radiology which deals with the diagnostic application of roentgen rays

4 Therapeutic radiology is that branch of radiology which deals with the therapeutic application of roentgen rays, radium and radioactive isotopes

5 Radiological physics is that branch of physics which deals with the medical application of roentgen rays and the radiations from radioisotopes, nuclear reactions and particle accelerators.

6 X-ray and radium physics is that branch of radiological physics which deals with roentgen rays and radium

7 Medical nuclear physics is that branch of radiological physics which deals with radioisotopes, nuclear reactions and particle accelerators

GENERAL REQUIREMENTS

Each applicant for admission to the examination for a certificate in radiology shall be required to present evidence that he has met the following standards

GENERAL QUALIFICATIONS

1 Satisfactory moral and ethical standing in the profession

2 A license to practice medicine in the state or county in which he resides

3 Membership in the American Medical Association, or membership in such Canadian or other medical societies as are recognized for this purpose by the Council on Medical Education and Hospitals of the American Medical Association Except as herein provided, membership in other societies shall not be required

4 That the applicant holds himself out to be a specialist in radiology or one of its branches as defined under "definitions," and that he devotes his time primarily and principally (at least 75 per cent) to the practice of radiology or one of its branches

5 That he is a citizen of the United States or Canada Candidates from other countries must be permanent residents of that country and native citizens thereof

GENERAL PROFESSIONAL EDUCATION

1 Graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association If the applicant is a resident of the United States or one of its possessions and is a graduate of a medical school outside the United States or Canada, he must have a certificate of the National Board of Medical Examiners

2 Completion of an internship of not less than one year in a hospital approved by the same Council

SPECIAL TRAINING

1 After completion of the internship there shall be a period of special training in radiology of not less than three years in clinics, hospitals or dispensaries recognized and approved by the American Board of Radiology and the Council on Medical Education and Hospitals of the American Medical Association as competent to provide a satisfactory training in radiology This period of specialized training shall include

(*a*) Graduate training in pathology, radiation physics and radiobiology A period of six months full time training in pathologic anatomy is recommended but where this is not possible to arrange, the student during his three year training period may, by attending pathologic conferences, postmortem examinations and studying removed tissues receive adequate training in pathology It is recommended that radiation physics be taught by a combination of didactic lectures, practical examples and direct clinical demonstrations

(*b*) An active experience (residency) of not less than twenty four months in an institution, the radiologic department of which is recognized and approved by the American Board of Radiology and the Council on Medical Education and Hospitals of the American Medical Association as capable of providing satisfactory training

(*c*) Examination in the basic sciences of radiology as well as the clinical aspects thereof These examinations should be given by the student's instructors in order to allow those responsible for his training to certify to the board that he is adequately prepared

APPLICATION

The board desires to appraise the candidate's educational opportunities (premedical, medical and radiologic), the ability of his instructors, his hospital and teaching positions, his original investigations, his contributions to radiologic literature, his membership in medical societies and his local and general reputation

For this purpose, application must be made on a special blank which may be obtained from the secretary No application will be considered unless made on the regular application blank This application shall be forwarded with the required data, two unmounted photographs and the fee of $75 at least two months before the date of the examination

FEE

A fee of $75 must accompany each application blank This fee will not be returned, and no application will be considered until the fee is received This fee has been carefully computed and is used entirely for administrative purposes Members of the board and special examiners do not receive any compensation except for actual expenses connected with holding the examinations As the number of candidates decreases, it may become necessary to raise the fee

EXAMINATIONS

Each year the board will hold an examination in conjunction with the annual meeting of the American Medical Association, and, when sufficient applications are on file, a second examination will be held in conjunction with the annual meeting of the American Roentgen Ray Society and/or the Radiological Society of North America

For the present, examinations consist of practical and oral examinations, although written examinations may be added later The examinations are designed to test the candidate's fitness to practice radiology or one of its branches as a specialty The board will endeavor to adapt this examination to the candidate's experience and years of practice It will try especially to ascertain the breadth of his clinical experience, his knowledge of the basic sciences of radiology, and likewise his knowledge of the recent literature on radiology, and his general qualifications as a specialist in this branch of medicine

The examination consists of tests in film interpretation and an oral examination in pathology, physiology, radiophysics and radiobiology, as well as the clinical application of roentgen rays radium and radioactive isotopes The applicant is also examined in 'professional adaptability,' in an attempt to ascertain his attitude toward his fellow practitioners and his patients

Whenever an applicant fails to pass the examination the board, if requested, will make suggestions as to suitable courses of instruction for the purpose of overcoming his deficiencies

REEXAMINATIONS

If the candidate fails in the first examination he will be admitted to a second examination after one year has elapsed but not more than three years He must give ninety days' notice of his intention to appear for reexamination and pay an additional fee of $35 If a candidate who has failed does not appear for reexamination before the expiration of three years, he will be required to make a new application and pay an additional fee of $75

A candidate having failed twice may, after one year has elapsed, file a new application which must be accompanied by the fee of $75

AMERICAN BOARD OF SURGERY

Warren H Cole, Chairman, Chicago
Calvin M Smyth, Vice Chairman, Philadelphia
Lawrence Chaffin, Los Angeles
Clarence E Gardner Jr Durham, N C
Peter Heinbecker, St Louis
Thomas H Lanman, Boston
Leland S McKittrick, Boston
Robert M Moore, Galveston, Texas
John H Mulholland, New York
John D Stewart, Buffalo, N Y
John M Waugh Rochester, Minn
J Stewart Rodman, Secretary-Treasurer 225 S Fifteenth Street, Philadelphia

GENERAL QUALIFICATIONS

1 Moral and ethical standing in the profession satisfactory to the board

The board, believing that the practice of "fee splitting" is pernicious, leading as it does to a traffic in human life, will reserve the right to inquire particularly into any candidate's practice in regard to this question

2 Those whose activities are limited to the practice of surgery This includes diagnosis, preoperative and postoperative care It does not include obstetrics without surgical complications, or the general practice of medicine

PROFESSIONAL STANDING

1 Graduation from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association, or graduation from a foreign school considered acceptable by the board

2 Completion of an internship (straight or rotating) of not less than one year in a hospital approved by the same Council, or its equivalent in the opinion of the board, such as a year of study devoted to a single branch of medicine

SPECIAL TRAINING

The board considers the requirements outlined to be minimal in attaining its purpose, and encourages candidates to take advantage of broadening experience in other fields

Group I In addition to one year of internship or its equivalent, a candidate must have a minimum of four years of training in surgery in an institution or institutions acceptable to the board Three of these years must be spent in an approved residency or clinical fellowship One year may be spent in a surgical specialty, or experimental surgery or research, or work of such a character that the relation of the basic sciences of anatomy, physiology, pathology, bacteriology, biophysics and biochemistry to surgery is emphasized If the second year of a two year internship is surgical and is an integral part of a four-year graded training program, it will be acceptable to the board

During these four years of training a candidate must

1 Hold positions of increasing responsibility for the care and management of patients with surgical conditions

2 Have sufficient operative experience to acquire surgical skill and judgment through the performance of surgical operations with a high degree of responsibility but under circumstances providing adequate opportunity for consultation and advice

Group II The board realizes that there is not as yet an adequate number of four year graded residencies (Group I) to meet the needs of the country for qualified surgeons Therefore, the board will continue to recognize three years [1] of residency training in an institution or institutions acceptable to the board followed by two years of study or practice of surgery, during which time sufficient operative experience to meet the board's requirements must be obtained The latter two years must be taken under the supervision of a surgeon certified by or acceptable to the board, and carrying on his practice in hospitals approved as meeting the minimum hospital requirements of the American College of Surgeons Not more than two of the five years required by Group II applicants may be spent in the subspecialties of surgery

BASIC SCIENCES

The board does not insist that any special length of time be spent in the basic sciences, but knowledge of these sciences as applied to clinical surgery will be required in the examination In both groups I and II, as much as one year's credit, however, will be given to recognized graduate school courses in these basic sciences if such courses are an integral part of an acceptable university medical school, but only in Group II is this applicable to the three years of residency required The board will not, however, give credit for any post graduate course of less than six months duration

At the completion of training, the board will request responsible representatives of the institutions in which the candidate has had the major portion of his training to attest to his character and professional competency, and to recommend that he be admitted to its examinations This requirement is applicable to candidates in both groups

Approval will be given for experience obtained in institutions having training programs of less than three years only when such a program is affiliated with and forms an integral part of an approved graded residency

---

[1] When a candidate receives his training in more than one institution, it is imperative that he hold positions of increasing responsibility

MILITARY CREDIT

Candidates who were on active duty in the armed forces for one to two years and who entered these services prior to V-J Day (Aug 15 1945) will be given one year military credit Subsequent to Feb 15, 1946, credit for military service will be given on the same basis as in civilian training as described elsewhere Credit for military service may be applied to the residency requirements as outlined for Group II candidates, but military credit is not allowed for Group I candidates

REQUIREMENTS FOR FOREIGN BORN AND FOREIGN TRAINED APPLICANTS

Full citizenship status is required of residents of the United States United States citizens who are residents of other countries, and citizens of other countries must have completed at least the three year residency training requirements in a hospital in the United States In addition they are required to hold a license to practice surgery in the country in which they are resident or hold citizenship

APPLICATIONS

Prospective candidates considering themselves eligible for examination should submit a letter to the board's office outlining briefly, in concise and chronological order, their qualified training since graduation from medical school If the prospective candidate's letter appears to meet the minimum requirements, an application form will be mailed to the candidate for completion The processing of the completed application by the board's office and the Examination Committee requires a minimum of three months The candidate will then be notified by the secretary as to his acceptability for examination, his deferment or ineligibility

The eligibility of candidates whose training in some respects does not conform to requirements published above will require the action of the Examination Committee which may postpone the candidate's notification of acceptability Every candidate's final acceptability for examination is based not only on the evaluation of his training qualifications, but on recommendation by the board's advisors as to his professional ability as a surgeon, his ethical standing in the community and the strict limitation of his work to surgery

THE FOUNDERS GROUP

The Founders Group, to which were admitted those who had already amply demonstrated their fitness as trained specialists in surgery was closed in January 1940

EXAMINATIONS

The qualifying examination will be divided into Part I (written) and Part II (clinical, bedside and laboratory) In both of these parts, as previously stated, a knowledge of the practical application of the sciences fundamental to surgery will be required

Part I This examination will be given simultaneously in as many centers throughout the country as the board may determine suitable for the purpose, and is held twice a year, in the spring and fall All applications must be on file in the board's office at least three months in advance of the examination Candidates who are declared eligible are given ample notice as to the center to which they have been assigned for examination

The examination in Part I is written and covers a one day period There shall be two sessions of three hours each The examination concerns itself primarily with general surgical problems and in addition the application of the basic sciences of surgery to these problems

Part II The board may, at its discretion, require that a satisfactory operative report be filed before a candidate is eligible for Part II Such a report shall be made by a member of the Board Founders Group, or one certified by examination, designated to be present during a major operating procedure performed by the candidate

Part II of the examination shall be oral and practical and cover a one day period the schedule being arranged somewhat as follows

9 A M-1 P M—Clinical surgery (diagnosis, management and the application of physiology, biochemistry and bacteriology, as the case being examined on may offer an opportunity for doing so Roentgenographic interpretation will also be included)

2 5 P M—Applied Anatomy and Surgical Pathology

The board expects that every candidate shall be well prepared in applied anatomy and in surgical pathology In the latter subject more stress is laid on the diagnosis of gross specimens than on the recognition of microscopic pathology

Examinations in Part II are conducted in certain centers of the country selected by the board It is the board's desire to arrange these centers so as to geographically meet the needs of the candidates, on condition that suitable examination facilities can be provided Examinations in Part II are conducted by members of the board living in the region of the country in which they are held, together with selected members of the Founders Group resident in the centers chosen

GRADES

A candidate must receive an average of 75 per cent for each part to be entitled to the board's certificate

A candidate who fails in his examination in Part I shall have his papers reviewed by the Examination Committee

REEXAMINATIONS

Part I Candidates who fail Part I are required to wait one year before becoming eligible for reexamination

Part II Candidates who fail Part II in its entirety and those who fail in the single subject of clinical surgery are required to wait one year before establishing eligibility for reexamination Those who fail either anatomy or pathology are required to wait six months The board expects that during this period the candidate will make a reasonable effort to prepare himself in the subject or subjects in which he has failed

Should a candidate fail one examination in parts I and II further examination privileges will be decided in each individual instance by the Examination Committee, but only after the candidate has submitted satisfactory evidence of further substantial preparation The board may, for good and sufficient reason deny a candidate the privilege of further reexamination

FEES

The fee for the examination is $100, payable as follows $10 registration fee, $30 for Part I and $60 for Part II

Candidates shall be required to pay a fee of $30 for reexamination in Part I and $60 for reexamination in Part II

This board is a nonprofit organization All fees will be used, after a reasonable amount is set aside for necessary expenses, to aid in improving existing opportunities for the training of the surgeon The members of the board serve without remuneration

CERTIFICATION

After meeting the requirements for eligibility and passing the examination a certificate attesting to a candidate's qualifications in surgery will be issued by the board, signed by its officers

The board has discharged its responsibilities by conducting examinations and has issued certificates of qualification to those surgeons who have met certain clearly specified educational requirements and have successfully passed its examinations. In discharging its responsibilities, the primary purpose of the board has been to establish and maintain desirable standards in the education and training of the young surgeon

The American Board of Surgery has never been concerned with measures that might gain special privileges or recognition for its certificants in the practice of surgery It is neither the intent nor has it been the purpose of the board to define requirements for membership on the staffs of hospitals The prime object of the board is to pass judgment on the education and training of broadly competent and responsible surgeons not who shall or shall not perform surgical operations The board specifically disclaims interest in or recognition of differential emoluments that may be based on certification

BOARD OF THORACIC SURGERY

(An Affiliate of the American Board of Surgery)

CARL EGGERS Chairman, New York
CAMERON HAIGHT, Vice Chairman, Ann Arbor Mich
WILLIAM E ADAMS, Chicago
FRANK E BERRY, New York
BRIAN B BLADES, Washington D C
THOMAS H BURFORD, St Louis
MICHAEL E DEBAKEY Houston, Tex
EMILE HOLMAN, San Francisco
GEORGE H HUMPHREYS New York
RICHARD HARWOOD SWEET, Boston
WILLIAM M TUTTLE, Secretary Treasurer, 1151 Taylor Avenue Detroit 2 Mich

FUNCTIONS OF THE BOARD

1 To select Founder Members This group is composed of surgeons who have made meritorious contributions to thoracic surgery, as follows

(*a*) Active and senior members of the American Association for Thoracic Surgery, who have been certified by the American Board of Surgery, are eligible for consideration as Founder Members

(*b*) Other surgical members of the American Association for Thoracic Surgery will have their records reviewed by the board and may be recommended for Founder Membership with or without application

(*c*) Other surgeons, certified by the American Board of Surgery, who on application, and after review of their qualifications, are found to meet the requirements of the thoracic board

The Founders Group is now closed

2. To conduct examinations of satisfactory candidates who seek certification by the board

3 To improve the opportunities for the training of thoracic surgeons

4 To set up principles of education to guide young surgeons who desire to prepare themselves for proficiency in thoracic surgery

5 To issue certificates of qualification to all those meeting the board s requirements

REQUIREMENTS

1 Certification by the American Board of Surgery

2 Two years' training in thoracic surgery approved by the Board of Thoracic Surgery, or meritorious contributions to thoracic surgery One of these two years may be spent during the four years of training in surgery required by the American Board of Surgery

3 Written, oral and practical examination

DEFINITION

To qualify for the examination in thoracic surgery, the candidate shall have had two years of training in an active well integrated thoracic surgical clinic or clinics, or the equivalent amount of thoracic surgical training, on a mixed service consisting of thoracic and nonthoracic surgical cases Adequate training in both the tuberculous and nontuberculous aspects of thoracic surgery is expected In order to obtain this objective combined residencies between institutions of different types may be advantageous It is also required that the candidate be familiar with the basic sciences as related to thoracic surgery Under exceptional circumstances certain surgeons may, by virtue of recognized proficiency in the surgical treatment of thoracic diseases, qualify for the examination at the discretion of the board

APPLICATIONS

Prospective candidates desiring to apply for examination should consider whether they are able to meet the minimum requirements of the board They should then submit a letter to the secretary s office, outlining briefly their training and experience in thoracic surgery and ask for an application form An application form will not be sent unless evidence is submitted in a letter indicating that the prospective applicant appears to meet the minimum requirements

EXAMINATIONS

The Board of Thoracic Surgery will be governed in general by the rules laid down by the American Board of Surgery pertaining to examination as well as reexaminations

Rules may be changed however at the discretion of the Board of Thoracic Surgery

FEES

Founders Group To those who will be admitted to this group, a certificate will be issued The fee will be $50

Group to be certified by examination For the special examination in thoracic surgery and the issuing of a certificate the fee will be $100 Fifteen dollars of this fee is to accompany the application and will be considered as a registration fee It is nonreturnable to the applicant in case he is disapproved for examination

Reexamination The fee for reexamination will be $25

AMERICAN BOARD OF UROLOGY

Gilbert J Thomas, President, Beverly Hills Calif
George F Cahill, Vice President, New York
Charles C Higgins, Cleveland
Grayson Carroll St Louis Mo
A I Dodson, Richmond, Va

Thomas D Moore, Memphis, Tenn
Roger Graves, Boston
Harry Culver Secretary-Treasurer, Chicago
Office of the Secretary-Treasurer 30 Westwood Road Minneapolis 16

EMERITUS MEMBERS

William F Braasch, Rochester, Minn
Herman L Kretschmer, Chicago
T Leon Howard, Denver
Clarence G Bandler, New York
George Gilbert Smith, Brookline, Mass

APPLICATION BLANK REQUIREMENTS FOR ALL APPLICANTS

Application for certification must be made on a special form This will be provided by the secretary and must be returned to him accompanied by other required data and credentials, and by $50 of the examination fee

Requirements for Applicants —Each applicant, before he shall become eligible to take the examination for certification in urology, must

A Have graduated from a medical school of the United States or Canada recognized by the Council on Medical Education and Hospitals of the American Medical Association and must have completed an internship of not less than one year in a hospital approved by the same council (The former requirement is not applicable to a candidate who graduated from an institution now extinct, or whose graduation occurred before the American Medical Association had prepared a list of accredited medical schools) All graduates of foreign medical schools must obtain a license to practice in the state or province in which they reside, the certificate of the National Board of Medical Examiners and/or the certificate of graduation from a medical school recognized by the Council on Medical Education and Hospitals of the American Medical Association as capable of providing training comparable with that recognized in a ' Class A" medical school

B Establish in a manner satisfactory to this board that he is a physician duly licensed by law to practice medicine, that he is of high ethical and professional standing and that he has received adequate special training in urology

The board is attempting to increase and to standardize the facilities for urological training in teaching institutions, so that the expression special training in urology may be interpreted to include

1 A period of study after the internship of not less than three years in clinics, dispensaries, hospitals or laboratories recognized by the Council on Medical Education and Hospitals of the American Medical Association as competent to provide a satisfactory training in the special field of urology

The training requirements after the internship may be fulfilled in one of the following ways

(*a*) A three year residency in urology

When a resident obtains a senior rating or is in his final year of training, he should be in charge of the examination and treatment (surgical or otherwise) of an ample number of patients under the supervision of the senior consultant or attending urologist who must be a certificatee of the American Board of Urology

(*b*) A second year of rotating internship or a one year residency preferably in general surgery followed by a two year urologic residency which should have the same status as the last two years of a three year urologic residency

(c) Preceptorship

This type of training may be accepted but it is not encouraged

This and other variations from training described above, must be supported by evidence that the candidate has had training comparable with one of the two preceding types of residencies

2 An additional period of not less than two years in the practice of urology in the city from which he makes application

These special requirements conform with the suggestions made by the Council on Medical Education and Hospitals of the American Medical Association

After June 30, 1955, training requirements, after the internship, may be fulfilled in one of the following ways

1 One year general surgery Three years formal training in urology

2 Two years of general surgery Two years formal training in urology

3 One year of general surgery One year review of basic sciences or some special research Two years of formal training in urology

4 One year general surgery Two years of formal training in urology One year of credit for two years in a preceptorship, to be approved by the Credentials Committee and the board

C Make application to the American Board of Urology, whose duty it shall be to investigate the applicant s credentials and make a survey of his character

D Assure the board that he is engaged in the practice of urology and that he intends to continue to be so engaged

E Membership in the American Medical Association or comparable national medical association is recommended

FEE

The examination fee is $150 (This fee will be increased when the expense of the examinations and other activities of the board demand) Fifty dollars must accompany the application If, on investigation, an applicant is found lacking in any of the requirements stated above, he will be notified that he is ineligible for examination One hundred dollars must be paid when the applicant is accepted as a candidate for certification Neither fee shall be returnable in any event

If a candidate fails he will be permitted a second examination after one year or within three years, without additional fee, but he must give sixty days' notice of his intention to appear for reexamination After an applicant has failed twice, he must file a new application and pay a second fee

REQUIREMENTS FOR CERTIFICATION

According to the by laws of the American Board of Urology, applications received from applicants for certification shall be examined by the Credentials Committee and reviewed by the board When additional data are required to complete the application, these will be requested by the secretary

The requirements for certification include preparation of reports of twenty-five representative (not necessarily consecutive) major urological cases from private cases which must contain all items essential for diagnosis therapy, prognosis, results of treatment and so on, oral-clinical examinations written examinations and personal appearance before the board

In specific instances, the board may waive any part of these requirements, with the exception of the item of personal appearance

Each candidate will receive a notice of the time and place of the examinations, and an appointment for his personal appearance before the board

EXAMINATIONS AND REPORTS OF CASE HISTORIES

The board will hold one examination per year This may be held in association with the annual meetings of the American Urological Association or the American Medical Association, when this is practicable, or at other times and places that the board may select, or deem expedient

The written examinations are designed to test the candidate's preparation in, and his knowledge of the whole field of urology, including the fundamental subjects pathology, anatomy, physiology, embryology, bacteriology, physiological chemistry and endocrinology These may be given at the time of the oral-clinical examination or may be held on certain dates simultaneously in different parts of the country at places convenient for candidates The examination in pathology will consist of the identification of gross specimens and of sections of tissue observed through the microscope The examination in anatomy, physiology, embryology, bacteriology, physiological chemistry and endocrinology will be a test of the candidate's working knowledge of these subjects as they are related to the practice of urology

The oral-clinical examination will consist of discussions of common urological conditions The subjects forming the basis of this examination are urography, diseases of the genital organs including the prostate, diseases of the urinary bladder and diseases of the ureters and kidneys The examination may deal directly with data found in the reports of case histories that the candidates have submitted It will ascertain the candidate s familiarity with recent literature, the breadth of his clinical experience and his general qualifications for practice in the specialty of urology

The professional adaptability of each candidate will be investigated in an attempt to determine his ethical conduct and his attitude toward his patients and fellow practitioners

The reports of twenty five major urological cases must be representative cases from private practice The reports must be typewritten on 8½ by 11 paper and in duplicate, but need not be on any special form

Complete index lists must accompany the reports If they are obtained from more than one hospital they must be consecutive and a separate index list of each group should be provided These lists must state the operator s name at the head of each page, the name of the patient, the hospital and admission number and the dates of operation Statements from the superintendents of the hospitals attesting that the candidate was the operator *must be included* With the twenty five case reports there must also be an index, in consecutive order, of all major and minor urological surgery done during the last two years of practice The lists should be filed in the secretary s office for verification purposes

The data should be placed under proper headings and the arrangement of these should conform to the sequence of events incidental to the patient's admission to the hospital or clinic, the examinations made and treatment prescribed

Sufficient data should appear in these so that the examiner will know that a proper history was taken and that a thorough examination, including a complete physical survey, was made

The board requires that all of the essential points of the history and examination, as well as a complete description of the surgical procedure, shall be given Emphasis should be placed on the following items preoperative diagnosis, clinical and pathological diagnosis, laboratory data, including cultures of urine and chemical analysis of calculi, summary of postoperative course with special reference to morbidity, clinical findings at time of discharge from the hospital and subsequent follow up reports

A final short paragraph *must be prepared* for each case This must include the candidate's interpretation of the history in terms of pathology the basis for the diagnosis, the facts that determined the treatment prescribed, whether surgical or otherwise, the course of treatment to be pursued following discharge from the hospital or clinic, a critical discussion of the knowledge gained from the proper handling of the case, or from the errors made (if any) in the diagnosis and method of treatment

Each candidate must assume personal responsibility for the data in his case reports including autopsy findings and interpretation of urograms

A candidate must remember that these case reports are documentary evidence of his ability and that the material in them and the manner of presentation are important evidences of his competence as a urologist

The deadline for the receipt of case histories each year is September 1

Satisfactory case reports must be submitted before a candidate will be permitted to continue with other parts of his examination If case reports are pronounced unsatisfactory by more than one examiner, the candidate will be informed of this and requested to prepare others

LIMITATIONS OF FUNCTIONS OF THE BOARD

The conferring of degrees, 'Doctor of Medicine" or "Bachelor of Medicine" remains with the universities, where it belongs This board makes no attempt to control the practice of urology by license, or legal regulation and in no way interferes with or limits the professional activities of any duly licensed physician

ANNUAL REPORT ON INTERNSHIPS AND RESIDENCIES

The Council on Medical Education and Hospitals presents in this issue its twenty-fifth Annual Report on Internships and Residencies This report summarizes data on approved programs in 844 hospitals conducting intern training and in 1,120 hospitals offering residency training in the specialties The report with lists of approved hospitals is appearing at this time rather than in the spring as in years past to provide more current information to prospective applicants at the time they are seeking appointments

Two innovations have been made this year in the lists of approved internships and residencies In addition to the geographical list of hospitals approved for intern training, the Internship and Residency Number this year presents a classification of internships by type of service rotating, mixed, straight or special The residency section has also been enlarged to include a geographical list of hospitals approved for residency training together with a résume of the specialties for which each hospital is approved These changes have been made to provide more ready reference to and additional information about the internship and residency programs approved by the Council

The Council now approves residencies in 28 specialties and subspecialties In internal medicine approval is extended jointly by the Council, the American Board of Internal Medicine, and the American College of Physicians, in general surgery, programs are approved by the Council, the American Board of Surgery, and the American College of Surgeons In both of these major specialties, a Conference Committee on Graduate Training has been established with representatives from the three organizations concerned, to cooperate in a joint program for evaluation and approval of residency training in these specialties

Data submitted by hospitals conducting residency training reveals that there has been a marked increase during the past year in the number of residency positions that were unfilled In the annual report for 1950 there were 1,179 positions reported vacant This year the number of vacancies rose to 4,869 That this trend will be continued is considered inevitable in view of an anticipated decrease in the number of available applicants and the continued need for physicians by the military services

The Council expresses its appreciation for the wholehearted support received from hospitals conducting graduate training programs for providing the statistical information and other data on which the report is based The Council also acknowledges the essential contributions made by many other groups and organizations in carrying out the approval program and in making the annual report possible The Council has enjoyed particularly the cooperation of the specialty boards, the American College of Physicians, the American College of Surgeons, medical schools, and medical departments of the federal services

ANTIBIOTIC ANTAGONISM

The introduction of a wide variety of active chemotherapeutic agents has led to the use of combinations of two or more of these agents in the hope of securing additive or even synergistic effects Clinically effective combinations include dihydrostreptomycin and aureomycin in brucellosis and paraaminosalicylic acid and dihydrostreptomycin in tuberculosis Such combinations not only may offer an increased antibacterial effect but also may delay the appearance of drug-resistant organisms

Recently considerable experimental evidence has been presented to indicate that under certain circumstances antimicrobial agents may, when combined actually have an antagonistic action Thus Lankford and Lacy[1] studied the in vitro bacteriostatic action of aureomycin-penicillin and aureomycin-streptomycin mixtures on staphylococci and concluded that synergistic, additive, indifferent or antagonistic effects could be obtained, depending on the relative concentration of the two drugs Spicer[2] also demonstrated in vitro an interfering effect between certain antibiotics and concluded that, if an antibiotic to which a bacterial strain is only moderately sensitive is combined with one of high activity, the action of the latter may be impeded A more searching study of antagonisms has been undertaken by Jawetz and his associates at the University of California[3] These investigators have shown that under certain conditions aureomycin terramycin, chloramphenicol, and sulfadiazine are antagonistic toward penicillin, both decreasing its early bactericidal action in vitro and interfering with its therapeutic effect in experimental infections in mice Antagonism could not be demonstrated, however, if the concentration of the interfering drug was either too low to affect the test organism or sufficiently high to be strongly bactericidal, if penicillin was present for more than a few minutes prior to the addition of the interfering drug, or if excessive doses of penicillin were used Furthermore, they found that the effect was unilateral, penicillin failing to antagonize the action of the other four antibacterial agents These investigators suggest that antagonism is due to the fact that the interfering drugs modify the characteristics of the bacterial population so as to make it less sensitive to penicillin action Since penicillin is active only against actively growing micro-organisms, it is readily conceivable that bacteriostatic concentrations of these antimicrobial agents would lessen the effectiveness of penicillin On the other hand, a synergistic effect could be anticipated if agents such as bacitracin or streptomycin, which are active against nonproliferating organisms, were combined with penicillin While no evidence of the phenomenon of antibiotic antagonism has as yet been reported in the treatment of human infections, Jawetz and his associates express the hope that awareness of its possible occurrence will induce physicians to observe more carefully patients receiving combinations of chemotherapeutic agents

THE MATCHING PLAN FOR THE APPOINTMENT OF INTERNS

The Council on Medical Education and Hospitals in its Annual Report in this issue calls attention to the matching plan for the appointment of interns, which has been adopted as the official method for making intern appointments for the year 1952-1953 The plan is sponsored by the National Interassociation Committee on Internships This committee is comprised of representatives from the Council, the Association of American Medical Colleges, the American Hospital Association, the Catholic Hospital Association, the Protestant Hospital Association, and liaison representatives from the Medical Departments of those federal services that conduct intern training programs

After the successful results of a trial run last year, the plan has been put into effect for appointments to internships beginning in 1952 Essentially, it is a method by which the student's hospital preference and the hospital's rating of the applicant are matched through a central office Participation in the plan is on a voluntary basis, both for the hospital and the student It is anticipated, however, that both the large majority of hospitals approved for intern training and nearly all students applying for appointment will participate this year Agreements are entered into by both the hospital and the student committing them to the acceptance of the results of the matching procedure, if they enter the program

The matching plan assures the applicant of the opportunity for making an unhurried decision as to the hospitals of his choice and will eliminate for the hospital the last-minute confusion in clarifying the status of its applicants It provides a fair and impartial method for the appointment of interns and should be given wholehearted support by all hospitals approved for intern training

ADVISORY COMMITTEE ON INTERNSHIPS

Two recent developments regarding intern training are of direct interest to all hospitals conducting internship programs In its report in this issue, the Council states that, in the future, approval for intern training will be granted annually, and will include the number and types of internships for which the hospital is approved To implement the policy for this year, the Council had announced on June 30 a quota basis for the appointment of interns Although the latter program was subsequently deferred, the Council has strongly urged all hospitals to cooperate on a voluntary basis in appointing interns for next year in accordance with the provisions of the quota plan In the report announcement is also made of the appointment of an Advisory Committee on Internships, with representatives from the profession, from medical education, from the major clinical divisions, and from the field of hospital administration This committee is studying the whole question of intern training in its broadest aspects

The revisions in the Council's previous policy of internship approval and the establishment of a formal committee to make a full study of the internship program point up the fact that the internship today is in a state of flux and that intern training is in need of reclarification and redefinition as to its purpose and content That there will be significant changes in the present concept of the internship during the next few years seems certain

PHYSICIAN'S HANDBOOK

The Connecticut State Department of Health has made available to the physicians of the state a Physician's Handbook, which contains in convenient form information that every physician should know relative to the requirements of the state laws and the sanitary code regulations Reportable diseases are listed Information is given concerning their periods of incubation and their periods of communicability, and suggestions are made as to minimum control measures Legal requirements are set forth dealing with the commitment of the mentally ill, the reporting of births and deaths, the necessity of prenatal and premarital examinations, and other duties imposed by law on physicians This handbook also lists the services that are made available by the state department of health Physicians in Connecticut should find this handbook of great value Medical associations in at least two states, Indiana and Wisconsin, devote annually special issues of their journals to discussions of the requirements imposed by law on physicians This is a service that can be commended

THE PRESIDENT'S PAGE

A MONTHLY MESSAGE

In my travels as President of the American Medical Association, I have been telling and retelling the A M A story—not only to physicians but to persons I have met on trains and planes to newspaper reporters and to radio announcers Our Association has a proud history, and it daily performs vital services for physicians and for the public This story needs to be told, because the public and many physicians as well, have little understanding of what the A M A is and does

One of my favorite topics of conversation is the work of our Association in evaluating drugs and therapeutic and diagnostic devices Before the turn of the century many worthless drugs and secret remedies were promoted with false or exorbitant claims Since uniform standards for drugs were lacking and regulatory laws were inadequate the physician often had difficulty in selecting remedies on which he could rely To provide physicians with much-needed information on drugs, the A M A in 1905 set up a Council on Pharmacy and Chemistry

The general purpose of the Council was and is, to evaluate drugs to and report to the profession on their reliability, proven therapeutic value, and limitations As might be expected, the ethical pharmaceutical companies welcomed the new Council's scrutiny of their products and praised the A M A for this drug evaluation service The not-so-ethical firms were equally loud in their denunciation The new Council however, proceeded with its work in such a careful and scrupulously fair manner that within a few years Council acceptance was much sought after by the majority of manufacturers

The Council still follows the method of procedure it adopted in the beginning A firm wishing Council acceptance of a product must submit specimens of the drug for laboratory examination, evidence in support of proposed claims and certain other technical information

The Council office submits all this information together with data from its own files to a member of the Council or a consultant who is an authority in the field of the particular product He prepares a report on the drug sometimes with the assistance of a staff consultant This report together with the firm's presentation, is included in the biweekly Council Bulletin, which goes to all 18 members Each of them individually considers the evidence and sends to the Council Secretary his comments and any additional information he may have on the product A symposium of members opinions is then carried in the next Bulletin, at which time they ballot on the product A three-fourths majority vote is necessary for acceptance, or the Council may vote to withhold acceptance pending a change in advertising receipt of additional information or for other reasons

The manufacturer is informed immediately of the Council s vote If the product is acceptable, he may then use the Council s Seal of Acceptance in his advertising following certain specified rules for its use In case of rejection, the manufacturer may request reevaluation of the product at a later time

Once a drug is accepted a monograph describing its actions and uses is published in The Journal and is later included in "New and Nonofficial Remedies, ' the Council s annual authoritative book on drugs Acceptance reports are also carried in many leading pharmaceutical publications

Because of these widely-published reports and because The Journal and many other scientific journals advertise only Council-accepted drugs, the A M A Council on Pharmacy and Chemistry wields powerful voluntary influence in encouraging the ethical promotion of drugs While the Council itself does not conduct active campaigns against all worthless drugs, it does investigate many and issues public reports exposing their fraudulent or valueless nature

The Council established a Committee on Research which has played a valuable role in coordinating many special drug research projects It also supervises the granting of certain A M A funds for research

The pioneer Council on Pharmacy and Chemistry served as a pattern for the establishment in 1925 of the A M A Council on Physical Therapy later to become the Council on Physical Medicine and Rehabilitation This Council evaluates therapeutic and diagnostic devices following much the same procedure for acceptance or rejection as the Council on Pharmacy and Chemistry

Because of the increasing importance of the field of physical medicine and rehabilitation, the Council will, within the next few months, set up a physical laboratory at A M A headquarters for improved testing of devices It has also recently added a full-time physician-Secretary to an executive staff composed of a noted physicist and a physician who will direct the new laboratory

In addition to evaluating therapeutic and diagnostic devices, the Council (1) encourages the development of facilities for training more physiatrists occupational therapists, and physical therapists, (2) evaluates clinical methods employed in rehabilitation centers and health resorts, and (3) promotes research in biophysics as related to therapeutic and diagnostic devices

The physicians who serve as members of these two Councils give freely of their time and effort We of the profession owe a debt of gratitude to these men who so truly live up to the motto of the Council on Pharmacy and Chemistry, "Not for Ourselves but for Medicine

One way in which we can further their good work guard the welfare of our own patients, and support ethical manufacturers—all at the same time— is to use Council-accepted products in our practices

If we receive no more from our A M A dues than this service in evaluating drugs and devices, with its regulatory effect in both fields we would be getting an excellent return

John W Cline, M D, San Francisco

ORGANIZATION SECTION

INTERNSHIP APPOINTMENTS

The Council on Medical Education and Hospitals has approved the official Co operative Plan of Internship Appointments sponsored by the National Interassociation Committee on Internships A schedule of dates in 1951 and 1952 for first year internships for 1952 1953 is published below for the information of students and hospitals participating in the plan

1 Sept 15, 1951 Hospitals and federal services participating return signed agreements and details on internships offered

2 Oct 15, 1951 Directory of internships offered by participating hospitals and federal services distributed

3 Nov 1, 1951 Seniors return agreements to participate

4 Nov 1, 1951 through Jan 7, 1952 Period for students to make application for internships to hospitals and for medical schools to send to hospitals letters of recommendation and credentials for their seniors The student should file a copy of his application with the dean s office, as well as one directly with the hospital The office of the dean will send his copy of the student application along with credentials and letters to the hospital before Jan 8, 1952

5 Jan 7, 1952 Closing date for senior to mail to the central office his confidential rank order list of the internships for which he has applied The list should be submitted as early as the senior has definitely made up his mind about his exact rank order of the hospitals to which he is applying

6 Jan 15, 1952 through Feb 1, 1952 Student is sent for verification a confirmation copy of his confidential rank order list of internships for which he has applied

7 Feb 1, 1952 Each hospital and federal service is sent an alphabetical list of students who report having applied for each type of internship offered

8 Feb 15, 1952 Closing date for hospital or federal service to return its list with each student rated (Early return of these forms is desirable)

9 March 14 1952 The results of the plan are sent to hospitals and federal services and students

10 March 14 31 1952 Appointments are confirmed by students with hospitals or federal services

11 March 18, 1952 Should any participating student not be matched by the plan, he will be informed of internship vacancies, and hospitals and federal services will be sent a list of available students Individual negotiation will then be in order between the hospitals or federal services and these students

MODEL COMMUNITY SURVEY ON CHRONIC ILLNESS

The Commission on Chronic Illness has just published a Model Community Survey to serve as a guide for individual communities taking inventory of existing facilities and services in connection with a chronic disease program Communities all over the nation are taking steps to solve the growing problem of how best to provide for long term patients Many have already made thorough studies of the local problems and are planning programs based on the facts revealed The 81 page survey publication includes a comprehensive outline of programs, services and facilities that might be surveyed—the types of health and welfare activities that some day could be molded into one co operative community chronic illness program

Copies of this survey may be obtained from the Commission on Chronic Illness, 535 N Dearborn St, Chicago 10, for $1 The Commission, now an independent national agency, was founded by the American Hospital Association, American Medical Association, American Public Health Association, and American Public Welfare Association The present chairman of the Commission is Leonard W Mayo, New York

PRESENT CONGRATULATIONS TO NATIONAL BROADCASTING COMPANY

On Sunday, September 23, during a broadcast on a nation wide network of the National Broadcasting Company the network was formally presented with a resolution of congratulations on the 25th anniversary year of the National Broadcasting Company The resolutions passed by the House of Delegates at the Annual Meeting of the Association in Atlantic City, in June 1951, were presented by Dr W W Bauer Director of the Bureau of Health Education The citation was accepted for the network by Niles Trammell, chairman of the board of the National Broadcasting Company

The action of the House of Delegates was prompted by the long record of cooperation in health education by radio between the National Broadcasting Company and the American Medical Association, beginning with weekly health talks in 1933 and including such dramatized series as Doctors at Work, Doctors at War,' Doctors at Home,' 'Medicine in the News" and other annual series carried from 1935 through 1949 During the past two years the network has also contributed facilities for special documentary programs on industrial health school health, atomic medicine, and diabetes

The occasion of the presentation was another documentary broadcast on Sunday, September 23, from 10 30 to 11 p m Eastern Daylight Time Entitled Worthy of His Hire, the program was prepared in cooperation with the President s Committee for Employment of the Handicapped affiliated with the United States Department of Labor It was a plea for understanding of and employment of handicapped workers

FEDERAL MEDICAL LEGISLATION

Armed Forces Reserve

Representative Brooks of Louisiana introduced H R 5277, *relating to the reserve components of the Armed Forces of the United States*

After weeks of hearings, the House Armed Services Committee has written this bill, which seeks to amend the laws pertaining to the reserve components of the military services The 74 page bill attempts to equalize the obligations placed on reservists by providing that after three years of satisfactory service in the Ready Reserve a reservist would be placed in a Standby status on application and protected against further obligation to serve unless a national emergency is declared by Congress A total of eight years of combined Ready and Standby Reserve service is demanded of all eligible persons Looking toward the inauguration of a universal military training program, this means that, after six months of basic training, men would be required to serve for a minimum of three years in the Ready Reserve during which time the President could order them into active service in an emergency After the third year in the Ready Reserve if application for release is made, persons would be transferred to the Standby Reserve where only Congress after declaring a national emergency, could order them involuntarily into service for the remaining five years of their total eight year term The Secretary of Defense is required to designate an assistant secretary whose principal responsibility shall be all reserve affairs of the department The bill also provides that there shall be no discrimination between and among members of the regular and reserve components in the administration of laws applicable to both regulars and reserves

This bill brings up to-date the provisions of H R 4667 and H R 4860, by the same author and on the same subject

---

The summary of federal legislation was prepared by the Washington Office of the American Medical Association

MEDICAL NEWS

CALIFORNIA

Lane Medical Lectures —These lectures on proteins and enzymes will be delivered by Kaj Ulrik Linderstrøm Lang Ph D director of the Carlsberg Laboratory Copenhagen Denmark at 8 15 p m in Lane Hall, Stanford University School of Medicine San Francisco The schedule is as follows

Oct 2 Micromethods in Biological Research
Oct 4 Distribution of Enzymes in Tissues and Cells
Oct 8 Initial Stages in the Breakdown of Proteins
Oct 10 Enzymatic Breakdown of Ovalbumin
Oct 12 Synthesis of Proteins in Vivo

Annual Medical Surgical Institute —The San Joaquin Valley Regional Medical and Surgical Institute of the California Medical Association will hold its second annual session Oct 4-5 at the Hotel Californian in Fresno This is one of the five regional conventions sponsored by the California Medical Association in its postgraduate program Speakers are as follows

Paul A Gliebe San Francisco Differentiation of Organic and Functional Complaints
Marcus Krupp San Francisco Essential Office Laboratory Procedures
Hilliard J Katz, San Francisco Current Concepts in Diagnosis and Treatment of Rheumatic States
Edwin J Wylie San Francisco Obliterative Diseases of Blood Vessels
Lewis F Ellmore Los Angeles Treatment of Burns
Orville F Grimes San Francisco Injuries of the Abdominal Viscera
Lewis F Morrison San Francisco Common Infections of the Ear Nose and Throat
Edmund W Overstreet San Francisco Recent Developments in Office Gynecologic Treatment
Donald R Smith San Francisco Differential Diagnosis of Urological Signs and Symptoms

ILLINOIS

Annual Health Resort Lecture Series —The second annual North Shore Health Resort lecture series on emotional reactions to stress will be given at the health resort the first Wednesday of each month from October through June (second Wednesday in January) All physicians are invited The program through December is as follows

Oct 3 Lewis L Robbins Topeka Kan Failure and Frustration
Nov 7 Francis J Gerty Chicago Acute Illnesses
Dec 5 Vladimir G Urse Chicago Chronic Illnesses

General Practice Course —The Illinois Academy of General Practice and the five medical schools in Chicago are sponsoring a postgraduate course beginning Oct 10 and continuing through Nov 14 resuming Jan 9 and running through April 23 The lectures will be for two periods of two hours per week Registration closes Oct 1 The fee for members of the academy is $35 for nonmembers $75 The lectures will be held in Chicago Belleville Herrin, Alton Danville Peoria Bloomington Joliet and Rockford The curriculum will include gastroenterology chest diseases and urology, surgery pediatrics gynecology obstetrics and endocrinology medicine and dermatology eye ear nose and throat For information address Dr A I Doktorsky chairman Education Committee Illinois Academy of General Practice 7107 S Jeffery Ave Chicago

Chicago

Narcotic Violation —Dr Gilbert H Wynekoop 4900 Sheridan Rd was convicted in the United States District Court at Chicago of violation of the federal narcotic law and on Aug 14 was sentenced to a term of two years

Grants for Research —Seven grants totaling $15 100 have been awarded by the Hematology Research Foundation 72 E 11th St for investigations in leukemia and other blood diseases Michael Reese Hospital scientists received grants totaling $8 100 Stritch School of Medicine of Loyola University was given $1 500 Dr Steven O Schwartz of the Hektoen Institute for Medical Research of the Cook County Hospital $2 000 Mount Sinai Hospital $1 500 and Lenox Hill Hospital New York $2 000

Percy Research Foundation —The Nelson M Percy Research Foundation honoring the chief of staff of Augustana Hospital has been created by the hospital directors and by colleagues of Dr Percy who has been associated with the hospital throughout his 50 years of practice He is also senior attending surgeon at St Mary of Nazareth Hospital and is professor emeritus of clinical surgery at the University of Illinois

KANSAS

Appoint Acting Dean —Dr Edward H Hashinger professor of medicine and gerontology was appointed acting dean of the University of Kansas School of Medicine Kansas City, effective Sept 1 succeeding Dr Franklin D Murphy who resigned as dean to become chancellor of the university After returning from military service in World War I Dr Hashinger was appointed to the faculty of the school of medicine in 1921 During World War II he organized the 77th evacuation hospital unit and served as its executive officer and medical chief through the campaigns in North Africa and Italy He was then assigned as chief of the medical service at Crile General Hospital (U S Army) Cleveland

KENTUCKY

Centennial Meeting of State Society —The Kentucky State Medical Association will hold its centennial meeting in Columbia Auditorium Louisville Oct 2 4 The scientific program is made up entirely of Kentucky born or Kentucky educated physicians who have distinguished themselves beyond the borders of the state Out-of state speakers include the following

Reuben B Chrisman Jr Miami Fla Doctors Are Citizens Too
W Gayle Crutchfield Charlottesville Va Unilateral Upper Extremity Pain
Drew W Luten St Louis Physiological Considerations in Treatment of Congestive Heart Failure
Otho C Hudson Hempstead L I N Y Treatment of Fracture of Neck of Femur
Leonard D Heaton San Francisco Recent Observations on Frostbite
Fred P Helm Austin Texas Infant Mortality as Related to the Three Leading Causes of Death
William R Wilson New Haven Conn Coeliac Disease
Hugh G Jeter Oklahoma City Why Anemia?
Elbert DeCoursey Washington D C Human Injury from Atomic Explosion
Harry Beckman Milwaukee Not in the Thing Itself
Henry H Turner Oklahoma City Hypogonadism and Infertility in the Male
Henry W Cave New York Acute Surgical Abdomen
Daniel C Elkin Emory Ga Diagnosis and Treatment of Aneurysms and Arteriovenous Fistulas
Robert P Kelley Emory Ga Injuries of the Ankle
Dwight M Kuhns Washington D C Tropical Diseases in New Guinea the Philippines Japan and Korea During and Following World War II
Arthur W Allen Boston Ulcer and Cancer of the Stomach
Russell L. Cecil New York Cortisone and Corticotropin in Treatment of Chronic Arthritis
Earl E Gambill Rochester Minn Relapsing Pancreatitis
Julian Johnson Philadelphia Present Status of Cardiac Surgery
Robert P Ball Baton Rouge La Angiography
Arthur L. Juers Miami Fla Deafness Its Present-day Management

Dr John W Cline San Francisco President of the American Medical Association will give the principal address at the president s luncheon Wednesday at the Brown Hotel on Problems Confronting Medicine in the Immediate Future " The University of Louisville School of Medicine is holding five class reunions (1901 1911 1921 1931 and 1941) during the centennial These classes will be recognized at the meeting In addition to scientific and commercial exhibits there will be historial exhibits portraying one hundred years of medical developments and progress

---

Physicians are invited to send to this department items of news of general interest for example those relating to society activities new hospitals education and public health. Programs should be received at least three weeks before the date of meeting

MARYLAND

Postgraduate Lectures in Basic Sciences —The Postgraduate Committee of the University of Maryland School of Medicine announces a lecture course in basic sciences as they apply to the practice of medicine to be offered beginning Oct 3 Emphasis will be primarily on developments in the various basic sciences during the past 10 years Thirty-two two hour meetings will be held on Wednesdays at 4 p m except during university holidays, in Bressler Lecture Hall Each meeting will consist of a lecture on the topic of the day followed by a period devoted to questions and comments by the members of the group Lectures will be in the fields of physiology histology, pharmacology, biochemistry, neuroanatomy, and immunology Gross anatomy and pathology are not included, since these subjects are already covered by courses now being offered at the university Tuition is $50 Information may be obtained from the Office of the Postgraduate Committee, 6th floor Bressler Building, 29 South Greene St, Baltimore

MASSACHUSETTS

Seminar in Pediatric Neuropsychiatry —A postgraduate seminar *in neuropsychiatric disorders of childhood and youth will* be held at the Research Laboratory of the Walter E Fernald School in Waverly from 6 to 7 30 p m and 8 to 9 30 p m, on 10 successive Tuesdays beginning Oct 2 The seminar which covers psychoses, mental deficiency emotional disorders and cerebral palsy is open to physicians especially psychiatrists interested in child psychiatry and pediatricians It is also open to the auxiliary branches of pediatric neuropsychiatry workers in the field of psychology sociology social work and special education

MISSOURI

Anniversary of Tuberculosis Hospital.—The 50th anniversary celebration of the founding of Mount St Rose Sanatorium, St Louis, will be observed Oct 6 7 The hospital is reportedly the first institution of its kind established in the Middlewest for the exclusive care of tuberculous patients Facilities of the hospital will be shown to the public and exhibits will trace the hospital s history since its founding The St Louis Tuberculosis and Health Society will assist in the observance and will have a mobile x-ray unit on the grounds The Greater St Louis Community Chest is also participating in the anniversary In 1928 the sanatorium became affiliated with the St Louis University

NEW JERSEY

Clinic for Amputee Children —A seminar on the causes and rehabilitation of congenital amputations will be held at the Kessler Institute for Rehabilitation Pleasant Valley Way, West Orange, on Oct 17 beginning at 9 a m It is being held in conjunction with the semiannual free clinic for amputee children Dr Harrold A Murray of Newark will serve as moderator Among the speakers will be Dr Douglas P Murphy, Philadelphia, and Leslie C Dunn, Sc D, New York The afternoon program will be devoted to the individual examination of children by Dr Henry H Kessler, medical director of the institute Parents will be oriented to the problems of congenital defects and given specific instructions for the care of the amputee child at home Physicians may refer child amputees to the clinic by writing to the medical director of the institute The seminar is open to pediatricians, obstetricians, gynecologists, orthopedic surgeons, and technical personnel in rehabilitation and limb manufacturing There is no charge

NEW YORK

Appoint Safety Consultant —Mr Joseph M Goewey has been appointed as safety consultant, a new position in the New York State Department of Mental Hygiene The position entails responsibility for developing an advisory service relating to institution safety at the state mental hospitals and state schools Mr Goewey has been acting supervisor of the upstate safety division, State Insurance Fund for 15 years

Hutchings Memorial Lecturer.—The third annual Hutchings Memorial Lecture will be delivered Oct 1 at Syracuse University by Dr Robert A Cleghorn, associate professor of psychiatry at McGill University Faculty of Medicine Montreal, Canada on *The Interaction of Physiological and Psychological Processes in Adaptation* ' The Hutchings memorial lectures are sponsored by a memorial trust fund committee, together with the Onondaga County Medical Society, Syracuse Academy of Medicine, and Syracuse University College of Medicine

New York City

Tumor Conferences.—These conferences are being presented by Harlem Hospital beginning in October and extending through May The schedule is as follows

Oct 17 Cushman D Haagensen Cancer of the Breast
Nov 21 Bentley P Colcock Boston Thyroids
Dec 19 Joe V Meigs Boston Cancer of the Cervix
Jan 16 Sidney Farber Boston Recent Research in the Chemotherapy of Cancer
Feb 20 Ira T Nathanson Boston Relation of Hormones to the Therapy of Cancer
March 19 Joseph E Rall Rochester Minn Radioactive Iodine in the Study *and Treatment of Carcinoma of the Thyroid.*
April 16 Arthur Purdy Stout Tumor of the Pleura
May 21 Isidore Snapper Multiple Myeloma

Postgraduate Lecture —The Unity Hospital staff of Brooklyn will hear a lecture Oct 4 at 10 30 a m at the hospital on "The Management of Infertility," to be given by Dr Charles M McLane of Cornell University Medical College This instruction is provided by the Medical Society of the State of New York in cooperation with the New York State Department of Health

TENNESSEE

Postgraduate Course in Electrocardiography —This course presented by the Memphis Heart Association and open to all physicians in Memphis, Shelby County, and nearby territory, will be given on successive Tuesdays Oct 2 through Nov 29 at the University Center in Memphis from 7 30 to 9 30 p m Tuition *except for residents and interns, is $15*

Dr Alden Succeeds Dr Harrison as Department Head —Roland H Alden, Ph.D, formerly head of the department of microscopic anatomy, has been named chief of the division of anatomy at the University of Tennessee Medical Units in Memphis He succeeds Frank Harrison, Ph D, who has resigned to join the faculty of the Southwestern Medical School of the University of Texas, Dallas, but will continue as professor of anatomy until December Dr Alden has been on the faculty of the university since 1942 and has been professor and head of the department of microscopic anatomy since 1949 Dr Harrison joined the university staff as an instructor in anatomy in 1938

VIRGINIA

Annual State Medical Meeting —*The Medical Society* of Virginia will hold its annual meeting at *the Cavalier Hotel* in Virginia Beach Oct 7-10 under the presidency of Dr C Lydon Harrell, Norfolk Guest speakers include the following

Winthrop M Phelps, Baltimore General Management of the *Cerebral* Palsy Problem
Representative Hugh D Scott Philadelphia.
Theodore E Woodward Baltimore Bacterial Diseases.
John E Howard Baltimore Diagnosis and Treatment of Spontaneous Hypoglycemia

A panel discussion Monday at 4 p m on 'You and Your *Medical Associa* A M.A" will be presented by the American *Medical Associa* tion Dr Walter B Martin, member of the Board of Trustees will preside Speakers will be Drs Henry B Mulholland, Char lottesville, member of the Council on Medical Service *Louis* H Bauer, Hempstead, N Y., President-elect, and John T T Hundley, Lynchburg, president-elect of the *Medical* Society of Virginia Scientific and technical exhibits will be shown The Woman's Auxiliary will meet in conjunction with the associa tion

WEST VIRGINIA

Heart Association Meeting —The annual meeting of the West Virginia Heart Association will be held at the Hotel Morgan Morgantown on Oct 5 at 2 30 p m The scientific session will be opened by Dr Louis N Katz, Chicago president of the American Heart Association, who will speak on the dynamics of pulmonary embolism Dr Robert Taylor Cleveland will speak on electrolyte and fluid balance New officers will be elected following the scientific session The annual dinner will be at 7 p m

Warning Against Confidence Man —The Chamber of Commerce of Weirton reported to the West Virginia State Medical Association that a man using the name of H H Griffith has been representing himself as a salesman of medical books of the Pitman Publishing Company of Providence R I He is reported also to have used the name Griffith Publishing Company Those physicians in West Virginia who took advantage of his offer have had their checks cashed but have not received the merchandise Griffith is about 60 years of age, weighs about 185 pounds and is 5 feet 7 inches tall He has gray hair a florid complexion and has one upper tooth missing He has a pleasant manner a knowledge of medical terms and current events and is a good conversationalist He claims to be the father of a World War II aviator who was a companion of Ernie Pyle and who was killed on a raid over Tokyo The Pitman Publishing Company of New York (not Providence) has notified the Weirton Chamber of Commerce that it does not have a representative by the name of H H Griffith and further, that it does not publish medical books with the exception of a textbook on medical photography

GENERAL

Academy of Ophthalmology and Otolaryngology —The American Academy of Ophthalmology and Otolaryngology will hold its annual meeting at the Palmer House Chicago Oct 14 19 under the presidency of Dr Derrick Vail Chicago At the opening joint session of the specialties Dr Shields Warren Boston has been invited to speak on The Pathologic Pattern of Atomic Injuries " and Dr Champ Lyons Birmingham Ala , on Isotopes in Medicine Invited speakers giving papers before the sections include the following

Count Hermenegildo Arruga Barcelona Spain guest of honor *Consideration on Surgical Treatment of Retinal Detachment*
W Morton Grant Boston Clinical Tonography
Gilbert Roy Owen Los Angeles The Key Area in the Chronic Mastoid
Harley E. Cluxton Jr Chicago New Concepts in the Use of Corticotropin in Ophthalmology and Otolaryngology

The Jackson Memorial Lecture will be given Thursday morning by Dr John H Dunnington New York on Ocular Wound Healing In the afternoon Dr Jerome A Hilger St Paul will deliver the Wherry Memorial Lecture on The Autonomic Nervous System At the annual banquet Wednesday at 7 p m Dr Victor Johnson director of the Mayo Foundation Rochester Minn will speak on Problems in Graduate Medical Education Numerous alumni dinners are scheduled as well as special scientific programs

Life Insurance Research Grants —Applications for 1952 grants in aid of research on cardiovascular problems will be received by the Life Insurance Medical Research Fund up to Nov 15 Support is available for physiological biochemical and other basic research which bears on cardiovascular problems as well as for clinical investigation in this field It is expected that about $600 000 will be awarded in these grants Preference will be given to candidates who wish to work in the broad field of cardiovascular function or disease and to candidates who wish to work in institutions other than those in which they have obtained most of their experience A doctor s degree (M D or Ph D) or the equivalent is required The annual stipend varies as a rule being between $3 000 and $4 000 with larger amounts in special cases About 15 new postdoctoral fellowships will be available New grants and fellowships will become available on July 1 1952 A number of predoctoral fellowships for basic training in research will also be awarded Further information and application blanks may be secured from the Scientific Director Life Insurance Medical Research Fund 2 East 103rd St New York 29

Midwest Meeting of Physicians.—The Midwest Regional Meeting of the American College of Physicians will be held in the Arthur Johnson Auditorium of Ohio State University in Columbus Oct 13 Those speaking by invitation include the following

Herman K Hellerstein Cleveland Cardiac Complications During Surgical Operations and Their Control
William H Reeder Jr Albany Ga Pulmonary Infiltration with Eosinophilia
Royal Rotter Madison Wis. A Comparison of the Anticoagulants Dicumarol® (Bishydroxycoumarin) Compound No 63 and Tromexan® (Ethyl Biscoumacetate)
Erwin Levin Chicago A Simple Measure of Gastric Secretion in Man and Its Clinical Implications.
Malcolm M Hargraves Rochester Minn Lupus Erythematosus Clinicians Problem
Gordon S Stewart Oak Park Ill Ability of the Parathyroid Glands to Regulate Serum Calcium in the Absence of the Kidneys
Carl Davis Jr Chicago Problems of Transplantation of the Kidney in the Dog.

Portable Television Station —A complete portable television station began a 10 week air tour of Europe Aug 29 as part of Video Medico, the medical flying caravan Arranged by E R Squibb & Sons International Corporation and operated by Radio Corporation of America engineers, special electronic equipment will bring surgical and clinical demonstrations by television to an estimated 40,000 physicians and members of allied professions in Copenhagen, Stockholm Brussels, Catania, Turin Rome and Milan The tour in Europe has been arranged with the cooperation of the second International Poliomyelitis Conference (Copenhagen), the fifth general assembly of the World Medical Association (Stockholm) and Laboratories Labaz and Laboratori Palma, Squibb licensees in Belgium and Italy, respectively The scientific team that will handle the television programs in cooperation with local doctors will include seven RCA engineers and Leonard J Piccoli Ph D director of professional *services of the Squibb overseas laboratories Squibb and RCA* Victor last year conducted a similar tour through South America demonstrating the new teaching medium before 16 000 members of four leading Latin American medical groups

Pathologists' Meetings.—The annual meetings of the College of American Pathologists and the American Society of Clinical Pathologists will be held at the Drake Hotel Chicago Oct 15 19 The first day will be devoted to college activities, the second day to joint undertakings and the remainder of the week to the society s program The college will hold three panel discussions Oct 15 They are as follows

Blue Cross and Blue Shield Donald H Kaump Detroit moderator and John L Lattimore Topeka Kan Frederic E Elliott New York, Leo H Garland San Francisco Frank R Bradley St Louis Henry S Ruth Philadelphia and Mr Frank E Smith Chicago
Liaison Relationships in Organized Medicine Theodore J Curphey Hempstead N Y moderator and Ernest B Howard Chicago Leroy E. Burney Indianapolis E Dwight Barnett Detroit Herbert R Brown Rochester N Y and Maxwell J Fein New York
Handling of Medical Legal Unknowns Samuel A Levinson Chicago moderator and Russell S Fisher Baltimore Geoffrey T Mann Richmond Va Georg K Neumann Ph D Indianapolis Clarence W Muehlberger Ph D East Lansing Mich Joseph B Nicol M S Pittsburgh and J W Holloway Jr LL B Chicago

Scientific symposiums will be presented jointly by the two societies on Tuesday The first of these deals with parasitology and will be presented through Dr Emma S Moss, New Orleans In the afternoon a symposium on azotemia will be given, Robert P MacFate Ph D Chicago introducing the subject Detlev W Bronk Ph D president of Johns Hopkins University Baltimore will give the address at the joint banquet of the college and the society Tuesday evening Dr Tracy B Mallory, Boston, will present the Ward Burdick Award contribution of the American Society of Clinical Pathologists Wednesday morning on the clinico pathologic conference in the evolution of medical practice Thursday morning a symposium on electrolytes will be presented with Dr Benjamin B Wells, Little Rock, Ark , as moderator Participants will be Drs Carroll F Shukers Owen W Beard and Philip J Almaden all of Little Rock

Cancer Society Nomenclature Manual.—In an attempt to clarify and standardize the complicated terminology of cancer, the American Cancer Society has issued a new book titled ' Manual of Tumor Nomenclature and Coding" It will be distributed to cancer clinics and registries hospitals health departments medical schools research centers and to individual pathologists, surgeons, and statisticians Widespread use of the new tumor code is expected since it will be used in conjunction with the American Medical Association's Standard Nomenclature of Diseases and Operations and the World Health Organization s International Statistical Classification of Diseases, Injuries and Causes of Death" Employment of the code will result in more comprehensive statistical records since it classifies both benign and malignant tumors according to histological origin Heretofore most cancer death and incidence records have indicated only the site of tumors Work on the manual has been in progress since 1948 under the direction of an American Cancer Society statistics committee, Dr W Thurber Fales director of statistics for the City Health Department, Baltimore, chairman

Prevalence of Poliomyelitis—According to the National Office of Vital Statistics the following number of reported cases of poliomyelitis occurred in the United States in the weeks ended as indicated

DEATHS

Kretschmer, Herman Louis ⊕ a former President and Treasurer of the American Medical Association, died at his home in Chicago, September 23, aged 72, of acute ventricular failure Dr Kretschmer was born in Chicago on April 22, 1879 He received the degree of doctor of medicine from Northwestern University Medical School in 1904 and graduated from the university school of pharmacy in 1900 He became clinical professor of surgery at Rush Medical College, urologist at Presbyterian Hospital, consulting urologist to the Children's Memorial Hospital and was on the staff of the Veterans Administration Hospital in Hines, Ill In September, 1945, Dr Kretschmer became clinical professor of urology at the University of Illinois College of Medicine, serving until September, 1947, when he became clinical professor of urology, emeritus He had resigned as attending genitourinary surgeon to the Alexian Brothers Hospital in 1926 He served as chairman (1923 1924) and secretary (1920 1923) of the Section on Urology of the American Medical Association president of the American Urological Association the American Association of Genito Urinary Surgeons and the Clinical Society of Genito Urinary Surgeons His leadership was also recognized by membership in the International Society of Urology and his election to corresponding membership in the German and Hungarian urologic associations He was one of the organizers of the American Board of Urology in September, 1934, and had served continuously as its president until 1945 He was a fellow of the American College of Surgeons and was an honorary life member of the Toledo Academy of Medicine He was president of the Chicago Medical Society in 1931 and served for years as a member of its council He was president in 1948 of the Interstate Post Graduate Medical Association of North America and member of the board of governors of the Institute of Medicine, of which he had been president He was a member of the Western Surgical Association, Association for the Study of Internal Secretions, American Radium Society American Social Hygiene Association, American Association for the Advancement of Science, Association of Military Surgeons of the United States, and the Society of Medical History of Chicago In 1942 Dr Kretschmer was presented an award of merit from Northwestern University in recognition of worthy achievement that had reflected on Northwestern, and two years later was granted an honorary doctor of science degree He was a captain in the medical corps of the U S Army during World War I, and at the time of his death was a member of the board of honorary consultants of the Army Medical Library He was a member of the National Research Council and as chairman of the subcommittee on urology was responsible for the manual of war surgery on urology In 1930 he delivered the Mayo Foundation Lecture on urology at Rochester, Minn, the Lower Lecture before the Academy of Medicine of Cleveland in November 1944, the Belfield Memorial Lecture of the Chicago Urological Society in October, 1950, and the fourth Peter T Bohan Lecture at the University of Kansas Medical School in November, 1950 He was a member of the board of trustees of the Chicago Latin School and of the Harris Schools, serving as president of the latter In 1944 Dr Kretschmer received the honorary degree of doctor of science from Marquette University School of Medicine in Milwaukee and in 1949 was awarded the Cross of the Chevalier of the Legion of Honor of France in behalf of his contributions to medicine and his efforts in having the Pasteur monument placed in Convalescent Park, Chicago, opposite the Cook County Hospital He was author of many scientific articles and in 1945 was elected chairman of the board of editors of the *Journal of Urology*

HERMAN LOUIS KRETSCHMER, M D, 1879-1951

Kelly, William Webber ⊕ Green Bay, Wis, born Dec 7, 1876, University of Bishop College Faculty of Medicine, Montreal, Canada, 1903, past president of the state board of health and the Brown County Medical Society, served as president of the city board of education and as director and physician of the Green Bay Packers football team, fellow of the American College of Surgeons, affiliated with St. Mary's, St. Vincent's and Bellin Memorial hospitals, formerly a member of the board of visitors and the board of regents of the University of Wisconsin in Madison, died Aug 3, aged 74 of coronary thrombosis

Bass, Albert Leonard, Louisville, Ky, University of Louisville Medical Department, 1912, specialist certified by the American Board of Otolaryngology, member of the American Medical Association and American Academy of Ophthalmology and Otolaryngology, fellow of the American College of Surgeons, served during World War I, formerly on the faculty of his alma mater, affiliated with Louisville General, Children s, Kosair Crippled Children, St Anthony's, and Kentucky Baptist hospitals and Norton Memorial and St. Joseph infirmaries died July 18 aged 64

Lee, James Francis ⊕ Mount Vernon, Ohio, Starling Medical College, Columbus, 1897 died June 29, aged 74, of coronary occlusion and pneumonia

Null, Harry Olen, Chattanooga, Tenn, Chattanooga Medical College, 1907, also a pharmacist for many years county physician, affiliated with Erlanger Hospital, died June 23, aged 85

Seid, Reuben, Chicago, University of Illinois College of Medicine, Chicago, 1927, member of the American Medical Association died July 8 aged 53 of coronary occlusion

CORRECTION

Dr Orenstein Not Dead—The obituary notice of Dr Archie Orenstein of Hilo, Hawaii, published in THE JOURNAL, Sept. 1, p 75, was in error It was Dr Orenstein's son, Morton T Orenstein, who was killed in an airplane crash

---

⊕ Indicates Fellow of the American Medical Association

GOVERNMENT SERVICES

CIVIL DEFENSE ADMINISTRATION

FCDA Policy on Construction of Hospitals.—FCDA has announced that its policy on hospital construction will be as follows

1 To encourage the location of new hospital facilities outside or on the periphery of the designated critical target areas, or if within such designated critical target areas, in positions appropriately removed from concentrations of other elements that constitute profitable enemy targets in order to minimize expenditures for shelters and other protective features required in target areas

2 To foster when the proper authorities determine that new hospital facilities are required in a critical target area the incorporation of essential shelters and other protective features in such facilities FCDA may contribute to the cost of such shelters and protective facilities

3 To encourage the construction of essential shelters and protective facilities in existing hospitals in critical target areas, and to make contributions toward the cost of shelters and other protective features

DEPARTMENT OF DEFENSE

Induction of Medical Officers for August and September Postponed.—The planned induction of 333 Priority I medical officers originally scheduled for August and once delayed temporarily, has again been delayed at the request of the Department of Defense In addition, the scheduled induction of 152 Priority I medical officers for September also has been temporarily postponed

The Department of Defense emphasized that the request was based entirely on a sustained volunteer rate of doctors applying for Reserve Commissions in the Armed Forces and does not represent a reduction in requirement for medical officers

Future induction of Priority I medical officers is dependent on the volunteer rate If the number of doctors applying for reserve commissions in the Armed Forces is not sufficient to fill requirements, it will be necessary to make up the shortage by induction

Priority I doctors are those who received their medical education at government expense, or were deferred from service during World War II to attend medical school, and who have served less than 90 days in the Armed Forces, the Coast Guard, or the United States Public Health Service

PUBLIC HEALTH SERVICE

Ultrasonics in Sewage Disposal.—Sound waves may be a means of reducing water pollution, according to Mark D Hollis, assistant Surgeon General of the Public Health Service The possibility was reported by Walter Lyon, a Public Health Service engineer, in the *Sewage and Industrial Wastes Journal* of September, 1951 His report on experiments conducted at Johns Hopkins University states that high frequency sound vibrations, beyond human audibility appear to speed up the process of settling solids out of sewage Practical application of the phenomenon will depend upon further technical development, Mr Lyon said

Hospital Construction.—By June 30 1951, the Public Health Service approved 1,580 applications for the construction of hospitals, health centers, and other related facilities under the Hill Burton Hospital Survey and Construction Act. The estimated cost of these projects is almost $1,186 000,000, of which the Federal share is over $424,000,000 Hospital beds provided by construction projects approved by June 30 will total nearly 76,000 Approximately 60% of the projects are for completely new facilities additions or alterations to existing facilities comprise the remaining 40% There were 709 new hospitals among the new construction projects and 235 health centers and other related hospital facilities

The majority of new projects are for health centers and for hospitals with less than 100 beds in communities with less than 5,000 population, while most of the alterations and additions to existing facilities are for hospitals with 100 or more beds in larger cities

Microbiological Research Program.—The Microbiological Institute of the National Institutes of Health, has awarded 102 research grants amounting to $1,088,952 for study of the therapy, epidemiology, and microbiology of a variety of diseases including tuberculosis, encephalitis, leprosy, amebiasis schistosomiasis malaria, Q fever, meningitis, and fungus diseases Other studies will be made on basic problems of the growth mechanism and action of bacteria and viruses

U S. ATOMIC ENERGY COMMISSION

AEC to Resume Operations at Nevada Test Site.—The Atomic Energy Commission will resume test operations in the near future at its Nevada test site near Las Vegas, according to Carroll L. Tyler, manager of the Commission's Santa Fe operations office Mr Tyler further said

> The Atomic Energy Commission has authorized a program of experimental detonations of both ordinary high explosives and nuclear explosives to begin in the near future The site will be used periodically Individual experiments and series of tests will be conducted as required. All tests will be under controlled conditions As was demonstrated during the test program in Nevada earlier this year there will be adequate safety provision
>
> Off-site radiation above normal levels which resulted from the previous Nevada tests was far below the levels which could be harmful to humans animals or crops. Similar radiation levels which are slightly above normal may be anticipated following some experiments. This will occur not only in Nevada but also in other sections of the country All necessary precautions including radiological surveys and patrolling of the surrounding territory will be undertaken to insure that safe conditions are maintained

MISCELLANEOUS

To Lecture in Pakistan.—The state department announced that Dr Ulysses Grant Dailey, Chicago, has been selected to tour Pakistan for three months, giving lectures and holding clinics for the surgical profession and for medical students there Dr Dailey is former chief of the surgical department at Provident Hospital, and is now consultant to the department He is an assistant editor of the *Journal of the International College of Surgeons* and is a fellow of both the International College of Surgeons and the American College of Surgeons A graduate of Northwestern University, he taught anatomy at Northwestern for a number of years and did postgraduate work in Paris, Berlin and Vienna He plans to leave Oct 1 and return Feb 1 concentrating his activities in Karachi and Lahore in western Pakistan, and Dacca in eastern Pakistan

Children's Bureau.—Approximately 215 000 children received diagnostic service or treatment under state crippled children's programs during 1950, an increase of 35,000, or 18%, over the 1949 record This record included the largest number of children (40,000) ever hospitalized by state crippled children's agencies in these federally-aided programs conducted under the Social Security Act The average length of hospital stay was 36 days per child as against 53 days in the year 1943, which had the peak record The shorter hospital stay required was attributed to earlier detection and treatment, use of antibiotics, and increased knowledge of treatment for crippling conditions

FOREIGN LETTERS

DENMARK

Danish Vital Statistics.—The Danish Ministry of Health has published some vital statistics for 1949 and 1950 The "normal incidence, based on the records of previous years of certain diseases is given in parentheses In 1950, there were only 17 cases of typhoid (40) and only 42 cases of paratyphoid (120) Epidemic encephalitis decreased to 13 (30), and diphtheria to 61 (1,350), a decline foreshadowing the complete extinction of this disease in the near future Puerperal fever decreased to 65 (240), and congenital syphilis to 24 (40) These figures are to some extent counterbalanced by the following figures In 1950, acute poliomyelitis with paralysis increased to 316 (50), measles to 63,745 (2,700) pertussis up to 18,133 (14,800), and influenza up to 255,630 (151,000) In the same year lobar pneumonia was practically doubled, with 7 457 cases (3,700) Gonorrhea increased only slightly, but acquired syphilis increased to 743 (515) Delirium tremens, with 23 cases, was more than doubled (10)

The general mortality in 1950 was 9 2 per 1 000 inhabitants compared with 8 9 in 1949 There was an improvement in infant mortality, which was 31 per 1,000 live births in 1950, compared with 34 in 1949 During the last 12 years infant mortality in Denmark has been halved, a remarkable achievement which may be still further improved on in 1951, to judge by the data already available for the first part of this year Copenhagen is ahead of the rest of Denmark in this respect and has always been so A classification of the deaths in 1949 and 1950, respectively according to the diseases causing them, shows remarkable fluctuations Thus in 1949 there were as many as 137 deaths from pertussis, whereas in 1950 there were only 17 Deaths from pulmonary tuberculosis decreased from 672 in 1949 to 528 in 1950 and death from other forms of tuberculosis decreased from 111 to 76 As was to be expected, the deaths from cancer were approximately equal (6,634 in 1949 and 6,654 in 1950) The reduction in the number of suicides from 1,051 to 998 may possibly reflect improved treatment in cases of poisoning Deaths from diseases of the nervous system and heart rose between 1949 and 1950 There is now one physician to every 960 inhabitants in Denmark

New Danish Publications—Reference has already been made in these columns to the *Index Medicus Danicus*, published by the well known Ejnar Munksgaard firm The same publishers have also begun to issue two new quarterlies of interest to both doctors and book lovers The first is *Centaurus International Magazine of the History of Science and Medicine* The chief editor, Jean Anker, head of the University Library in Copenhagen, is assisted by A G Drachmann, E Gotfredsen (professor of the history of medicine at the University of Copenhagen) and M Pihl Twenty nine authorities from different parts of the world, including H R Viets of Boston and Douglas Guthrie of Edinburgh, are on the editorial board The original articles in *Centaurus* are to be published in English, French, and German and the annual subscription rate is 40 Danish kroner

The other quarterly, also costing 40 Danish kroner (publication by Munksgaard began in 1950), is entitled *Libri* its main object is to serve librarians and other book lovers Jean Anker is chief editor of this journal also Among the original articles in the first issue is one by Kleberg on bibliophiles in ancient Rome

Leocillin, a New Penicillin Derivative—In 1950, K A Jensen and collaborators published an account of leocillin a new penicillin derivative The journal of the Danish Medical Association, *Ugeskrift for Laeger*, for Aug 9, 1951, is largely devoted to this subject, an editorial article serving as an introduction to three original articles In the first two, experimental and clinical observations are reported The action of the soluble hydrochloride of leocillin was compared with that of penicillin and the action of a comparatively insoluble leocillin was compared with that of procaine penicillin in guinea pigs Healthy young human beings were tested with 300,000 units of leocillin and procaine penicillin in order that the concentration of the two in the serum might be compared The encouraging results of these tests led to the administration of leocillin in a single dose of 600,000 units to 25 patients with pneumonia Relapse occurred only in an 86 year-old patient, who recovered after a second injection of the same dose Though these findings suggest that a single large dose of leocillin may be relied on to effect a cure, it is probable that the treatment may have to be repeated when pneumonia has developed as a sequel to chronic bronchitis It may be claimed for leocillin that it is the first penicillin derivative showing a specific action on certain organs The comparatively high concentration of the antibiotic in the lungs and sputum, and in lesser degree in the brain, suggests that it may prove especially useful in chronic diseases of the lungs in which earlier penicillin preparations have failed to reach a sufficiently high concentration The third article by J C Nielsen, gives an account of the treatment of acute suppurative otitis media treated with procaine penicillin and a combination preparation known as dipenicillin The results achieved in 57 cases suggested that dipenicillin is more effective than the earlier preparation

Progress of BCG Vaccination in Denmark—In a recent survey of the development of BCG vaccination in Denmark Dr Knud Winge of Copenhagen has cited some instructive figures The school children of Copenhagen have been systematically tested with tuberculin since 1937, and since 1943 negative reactors at the school leaving age have been offered BCG vaccination Between Oct 1 1948, and March 31, 1949, five physicians went from one school to another to give this treatment Altogether some 39,000 tuberculin negative pupils or about 70% of all who were tuberculin negative, were thus treated Since this vaccination was carried out there has been a sharp decline in the number of notifications of pulmonary tuberculosis in children between the ages of 5 and 14 In 1948 there were 158 notifications of pulmonary and hilar tuberculosis In 1949 there were only 84 such new cases, and in 1950 this number was further reduced to 52 In none of these 52 cases had the children been vaccinated with BCG During the same period there has been a decided reduction in the number of children requiring admission to tuberculosis hospitals BCG vaccination is now being offered children under school age and to all infants born in the municipal maternity hospitals in Copenhagen Not one fatal case of tuberculous meningitis, miliary tuberculosis, or pulmonary tuberculosis has occurred throughout the period 1935 1950 among children vaccinated with BCG and known to the central tuberculosis authorities as belonging to an infectious environment

ISRAEL

Sickle Cell Disease Among Oriental Jews—The present mass immigration to Israel, with its host of problems, challenges medicine but also provides medical research with a multitude of opportunities F Dreyfuss of the Hadassah Hebrew University Medical School Jerusalem, has undertaken a study of the incidence of sickle cell disease and of thalassemia (familial erythroblastic anemia, or Cooley s anemia) among the various ethnic groups of Jews and others in the Middle East As published in *Nature*, he and his co-workers, G Mundel and M Benyesch, have found that the Yemenite Jewish community contains a fair number of carriers of the sickle cell trait In the first series of examinations at the Hadassah Childrens Hospital at Rosh haAyin, 20 children, among 188 examined (10 6%), mostly Yemenites, were found to have sickle cells One child may have had sickle cell anemia They discovered several instances of the sickle cell trait among members of other Oriental Jewish communities Admixture of Negro blood for various reasons, is most improbable in these groups Taking into consideration reports on the occurrence of sickling in other Mediterranean countries, these workers assume that a new reservoir of the sickling gene—a non Negro, Mediterranean source—has been found

CORRESPONDENCE

UNDECYLENIC ACID IN PSORIASIS

To the Editor—Drs Rattner and Rodin, in their article Treatment of Psoriasis with Undecylenic Acid by Mouth (*J A M A* 146 1113 [July 21] 1951) state, Although he [Dr Perlman] emphasized the preliminary character of the report there was no mistaking Perlman s enthusiasm over the results that were obtained, and this same note of satisfaction ran through his two subsequent reports The second paper quoted by I L Milberg and me was issued from the Skin and Cancer Unit of the New York Post Graduate Medical School and Hospital The clinical results were as follows Of 40 psoriatic patients with cutaneous lesions 12 showed unequivocal improvement during treatment 15 were somewhat improved 10 evidenced no change and 3 had distinct aggravation of the disease Seven of the eight patients with psoriatic arthropathy noted relief from pain While I participated in the survey of the clinical material the statistics were independently compiled accordingly such enthusiasm as was then displayed was shared by those who participated in the work and the preparation of the paper

Reference is made to an article by Drs L P Ereaux and G E Craig on "The Oral Administration of Undecylenic Acid for the Treatment of Psoriasis" (*Canad M A J* 61 361, 1949), but relevant quotation is not made of what they state in their summary We are sufficiently impressed with the results obtained in the treatment of psoriasis to continue with the internal administration of undecylenic acid alone and combined with topical therapy '

Of course undecylenic acid like any other drug may produce undesirable side-effects or reactions and, in the light of reports since the first papers appeared, the dosage as originally suggested for undecylenic acid should be reduced But the number of cases of clinical improvement of psoriasis observed with the administration of undecylenic acid which in many instances failed to respond to the customary therapy suggest that the improvement could scarcely have been mere chance but should be attributed to the action of the drug in spite of the vagaries of the disease which are well known Indeed as Drs Rattner and Rodin themselves state There has been no one drug or individual method of treatment that will cure psoriasis or even afford control of the disease in all cases with any degree of certainty It is this very difficulty that would warrant that any relatively safe drug carrying hope of therapeutic effectiveness in recalcitrant psoriasis, should be given an unbiased trial before it is declared worthless

I too have been disappointed by the many failures that I have experienced with undecylenic acid and my own results have not been consistent At the Chicago meeting I clearly stated While many dermatologists have had unfavorable results with the use of undecylenic acid for psoriasis others have had equally good results

Publicity given the subject in several health columns in newspapers was utterly unsought In my papers I laid no claim to nor professed to reach any conclusion as to, the efficacy of undecylenic acid in psoriasis and I merely recorded my observations which I felt would interest the medical profession Since my reports were sufficiently safeguarded by provisos against too sanguine an interpretation it is unfortunate that they should now be laden with implications which the texts were not intended to convey and that I should be identified with attitudes that were never mine

Final judgement as to the therapeutic merit of undecylenic acid in the management of psoriasis will necessarily rest with the members of the profession particularly those of our specialty in whose disposition for fairness and unbiased decision for the good of all concerned I have utmost confidence

ADRENOCORTICOTROPIC ACTIVITY OF PLASMA

To the Editor—The adrenocorticotropic activity of human blood plasma has been tested with different techniques in hypophysectomized rats but partially conflicting results have been obtained Generally normal or boiled serum (Taylor A B Albert A and Sprague R G *Endocrinology* 45 335, 1949 Golla Y M L and Reiss, M *J Endocrinol* 3 5 1942) and acetonic extracts of plasma or serum were used (Bornstein J and Trewhella P *Lancet* 2 678, 1950 Cooke D S Graetzer, E and Reiss M *J Endocrinol* 5 89, 1948) Since inactivation or losses of hormone might occur with these techniques thus accounting for the inconsistency of the results so far reported the adrenocorticotropic activity of the same samples of normal unfractionated blood plasma has been investigated immediately and 4 and 12 hours later, with the ascorbic-acid-depletion method (Sayers M A Sayers, G and Woodbury, L A *Endocrinology* 42 379 1948)

The volume of plasma injected in hypophysectomized rats was 0 5 ml per 100 gm of body weight two or three animals were used in every assay The blood of eight men was tested Mean falls in ascorbic acid concentration from 36 6 to 66 8 mg per 100 gm of fresh tissue were obtained when heparinized blood plasma was injected immediately after quick centrifugation at 4 C The calculated average is 54 9 ± 3 48, corresponding to 160 micrograms of hormone per 100 ml of plasma (the hormone for preparing the dose response curve was sent by Dr C H Li) After four hours at 18 to 20 C, the average activity was decreased 49% after 12 hours the activity had almost disappeared

A lower adrenocorticotropic activity (of about 39%) was found when the fractionated plasma prepared according to Bornstein and Trewhella, was tested

The present experiments show (1) that adrencorticotropic activity is found in normal human blood and (2) that losses might occur when the tests are made with fractionated plasma or unfractionated plasma left for some time at room temperature

PSYCHOTHERAPY IN CANCER PATIENTS

To the Editor—In their interesting article "The Psychological Management of Cancer Cases (J A M A 146 1547 [Aug 25] 1951), Drs Kline and Sobin conclude with the remark Other techniques such as hypnosis and intensive psychotherapy, are valuable in some cases I want to draw attention to the following *illustrative case In 1943* a patient was transferred to a state mental hospital apparently in pain He was restless did not appear *interested* in his family, and was totally absorbed in his symptoms In various other hospitals observers had found it difficult to believe that such severe pain would have existed for three weeks" His complaints were thought to be *psychoneurotic*, hypochondriacal and the like He had had an electric shock treatment in a private hospital In the state hospital the psychotherapeutic efforts stressed the necessity of relaxing and forgetting his personal problems and his preoccupation with his body Under such psychotherapeutic guidance and without receiving any potent medication he soon showed *increasing improvement* in his general attitude and behavior became much less plaintive and whining and worked regularly at occupational therapy He was observed talking freely and laughing with other patients It was decided to bring him up for parole but on the day this decision was reached, he died suddenly. Autopsy revealed pulmonary embolism and carcinoma of the pancreas with widespread metastases.

Dr. Otto Kant described this case in the *Psychiatric Quarterly* (20:129 [Jan.] 1946). When the patient actually was on the threshold of death, a psychotherapeutic approach led within a short time to a remarkable change of attitude and to complete suppression of his main symptoms," to which I want to add: Psychotherapy is worth while even in carcinomas.

CANCERPHOBIA

To the Editor:—I cannot overstate my enthusiasm for the contribution "The Psychological Management of Cancer Cases" by Drs. Kline and Sobin in the Aug. 25, 1951 issue of THE JOURNAL. It is a thoughtful, helpful, and, to me, an altogether satisfactory answer to the dilemma which so often confronts the doctor. I hope it will do much to quiet those who want the question "to tell or not to tell" answered categorically 'yes" or 'no.'

I am, however, disturbed by a statement which appears in the text: ". . . along with its benefits, the (cancer) educational campaign has resulted in an almost national cancerphobia." This is a remarkable generalization, and I wonder whether there is valid documentary evidence to support it. On the basis of a survey conducted by us in 1949 among a 10% sample of the diplomates of the American Board of Psychiatry and Neurology, it appeared that only 11% of the responding psychiatrists felt unequivocally that the current cancer education methods were *doing more harm than good, and therefore disapproved of them.* It is my belief that the phrase "national cancerphobia" is an unfair exaggeration of the facts. It is, moreover, an unwarranted indictment of the American character, which happily is not yet so weakened as to be panicked by cancer or by any other enemy, but which, per contra, continues to look reality straight in the face, to fear what deserves to be feared, and then to do something about it.

ALLERGY MISTAKEN FOR TUBERCULOSIS

To the Editor:—I would like to stress a certain phase of the excellent article "Problems of the Geriatric Asthmatic and Their Clinical Management" by Dr. Tuft (*J. A. M. A.* 146:1480 [Aug. 18] 1951). It concerns the often erroneous diagnosis of active pulmonary tuberculosis when the true diagnosis should be allergic bronchial asthma with latent pulmonary tuberculosis. At the height of the pollen season, susceptible persons suffer from pollen asthma. They cannot sleep, and they lose weight and strength. The x-ray may show pulmonary infiltration, and a diagnosis of active disease may be made. Most of these patients are hospitalized and given streptomycin. Within a few weeks they make a striking recovery; this is attributed to the antibiotic and other care, whereas the change occurred from the coincidental subsidence of the pollen season.

Over 25 years ago, I saw my first such patient ready to be sent to a sanatorium with what was diagnosed as advanced tuberculosis. The real cause, clinically confirmed three times, was feathers, first indicated by skin allergy tests. The asthma started in this patient after feather beddings were brought from overseas to his home. X-ray showed old healed lesions, erroneously regarded as active. This man is in very good health today. There are many such cases, in the differential diagnosis of which allergic bronchial asthma should always be included. One should keep in mind that more than one disease may be active.

MEDICAL MOTION PICTURES

Heparin in the Prevention and Treatment of Thrombosis: 16 mm., color, *sound, showing time 26 min. Produced in 1950 by the Jam Handy Organization, Detroit.* Procurable on loan from the Upjohn Company, Kalamazoo, Mich.

This motion picture covers the discovery, chemistry, physiology, manufacturing methods, and clinical application of heparin. The major portion of the film is devoted to clinical application, with particular emphasis on its use in peripheral venous thrombosis. There is also considerable emphasis on the various methods of administration of this drug, including the control by frequent determinations of the venous coagulation time. The picture is concluded with a comparison between heparin and bishydroxycoumarin (dicumarol®).

On the whole, it is a very good résumé of the present knowledge and value of heparin treatment. However, some of the overwhelming statistics reported are subject to revision on the basis of more recent work. There is perhaps too much discussion of the difficulties of bishydroxycoumarin administration and its control. A word of caution relative to the administration of protamine sulfate in concentrated solution should be introduced, and the value of heparin in pulmonary embolization, regardless of cause, should be more thoroughly stressed. This film is somewhat repetitious; with judicious editing it could be shortened without loss of any of its value. The photography and animation are well done. However, the film contains considerable statistical data, which would be difficult for any audience to retain. A supplementary booklet including this material would be helpful.

This film is recommended for general practitioners, specialists, residents, interns, and medical students in the third or fourth year in physiology, medicine, or surgery. It would be of some interest to nurses and technicians.

Obstetrical Maneuvers on the Ayers Manikin: 16 mm., color, sound, showing time 23 min. Prepared by Dr. Horace E. Ayers and Dr. John Mussio, New York Medical College. Produced in 1943 by Campus Films, New York. Procurable on rental or purchase from Clay Adams Company, Inc., 141 E. 25th St., New York 10.

This is a motion picture of a manikin demonstration. The film introduces the audience to the manikin practice room just outside of the obstetrical delivery room. The choice of forceps for the particular case is discussed; then the same obstetrical maneuver is shown by a demonstration of forceps delivery on the manikin and actual delivery on a patient. The film stresses the importance of manikin practice for both seasoned obstetricians and students. The employment of the Ayers manikin is a valuable adjunct to teaching the various operative obstetrical procedures to groups of medical students. A first impression might convey the idea that too many types of forceps are presented for student's use, but a further consideration of this as presented in the film portrays the value of the mechanism of this particular manikin and its adaptability to each type of instrument delivery. The close relation between the manikin practice and teaching on the live subject has an obvious value. The picture is suitable for medical students, instructors in obstetrics, and nurses. The photography is satisfactory.

Surgical Approaches to the Knee Joint: 16 mm., *color, sound, showing time 36 min.* Prepared by Dr. LeRoy Abbott, *University of California. Produced in 1951 by Churchill Wexler Productions, Los Angeles.* Procurable on loan from Presentation Division, Veterans Administration, Vermont Ave. and H St., N.W., Washington 25, D. C.

This well-organized film takes its place with the others in this series. The approaches used in the film are the median parapatellar, the approach for excision of the medial meniscus, the approach to the lateral compartment of the knee, and an especially well shown dissection of the popliteal space and the posterior knee compartment. It depicts the anatomic rather than the pathologic; for this reason it would be valuable for senior students who are reviewing anatomy with the surgical approaches in mind. It will be especially well suited for the training program of those in orthopedic and general surgery. The photography, animation, and narration are excellent.

Annular Pancreas.—The case discussed concerned a man 32, who had been under treatment for a duodenal ulcer for more than nine years Earlier x ray studies revealed "scar tissue from ulcer causing obstruction" The patient complained chiefly of epigastric pain nausea, gaseous distention and frequent belching. Relief was obtained only from vomiting Operation revealed a band of pancreatic tissue about 1 cm in thickness completely encircling the duodenum Proximal to this band the duodenum was dilated The portion of the pancreas anterior to the duodenum was resected The patient was greatly improved after the operation, but about six months later ulcer symptoms recurred and the dilatation of the second portion of the duodenum was as great as before the operation possibly because of the formation of adhesive bands An ulcer regimen effected significant improvement Fifty seven cases of annular pancreas have been reported in the literature Seventeen were treated surgically Of nine patients who had some type of short-circuiting procedure without a direct attack on the ring three died from unrelated causes, while six had a satisfactory result In those in whom the ring was removed persistent obstruction with retention in the stomach and duodenum was frequent while fistula formation was an added hazard

Anticoagulants in Carotid Ligation.—Pemberton and Livermore emphasize the management of those carotid body tumors in which ligation of the carotid arteries is required It is widely accepted that it is safer to ligate the common carotid artery than to ligate the internal carotid artery It is postulated that the rich anastomoses between the branches of the external carotid artery with those of the subclavian and opposite external carotid arteries allow collateral circulation to flow in a reversed direction down the external carotid, around the bifurcation, and up the internal carotid on the side ligated After ligation of the internal carotid artery a short distance above the bifurcation there remains a nearly stagnant column of blood, and this together with the trauma to the intima favors thrombosis The authors feel that the prophylactic use of anticoagulants is helpful in preventing late complications of ligation of the internal carotid artery They give 300 mg of bishydroxycoumarin orally 12 to 15 hours before operation when excision of the bifurcation of the common carotid seems likely Heparin is then started by continuous intravenous drip when the patient is on the operating table if the vessels actually must be sacrificed They keep the coagulation time between 15 and 20 or 25 minutes Oral administration of bishydroxycoumarin is resumed when the patient can take the tablets In 33 operations (32 cases), ligation was done 14 times with five deaths All deaths occurred in patients in whom no anticoagulants were used In the four cases in which anticoagulants were given plus one case of aneurysm of the common carotid artery in which treatment was similar, there were no deaths Residual cerebral symptoms persisted in only one patient, whose symptoms had appeared before administration of anticoagulants was started

An asterisk (*) before a title indicates that the article is abstracted.

and terramycin Hemophilus *pertussis was eliminated from naso*pharyngeal cultures in three to four days and then could no longer be recovered, while this organism persisted for two to four weeks in most of the penicillin treated patients Rapid and steady improvement in the general condition occurred in almost every patient treated with aureomycin, chloramphenicol, or terramycin, while only a few patients showed significant or rapid improvement during treatment with penicillin In the patients treated with aureomycin, chloramphenicol or terramycin, particularly in those under 1 year of age, the frequency and severity of the paroxysmal cough decreased more rapidly than in the penicillin treated patients In some patients, however, there was an exacerbation of cough after the treatment was stopped There was *suggestive evidence that penicillin* had a slight beneficial effect on the whooping cough Preliminary observations on the antibody response in some of the patients suggested that the more rapid elimination of H pertussis from the nasopharynx following treatment with aureomycin chloramphenicol, or terramycin may have delayed and reduced the specific antibody production as compared with that observed in the penicillin treated patients

Polyarteritis Nodosa in Infancy and Childhood—Polyarteritis nodosa, although observed more commonly in recent years, is still an uncommon disease in childhood and especially so in infancy Only 52 cases have been reported in the English literature in infancy and childhood up to the age of 15 years Of these 52 cases eight occurred in infants less than 2 years of age 17 in children between the ages of 2 and 8 years and 27 in children between the ages of 9 and 15 years Recognition of polyarteritis nodosa during life is very difficult because it rarely starts as an initial disease entity If there is any pattern of symptoms it is of multiple organ involvement Pathognomonic is the palpation of subcutaneous nodules along the course of subcutaneous blood vessels A biopsy of such a nodule will lead to the correct diagnosis It is uncommon to make a diagnosis in children from a biopsy of muscle or other tissue taken at random when a nodule is not present Two fatal cases of polyarteritis nodosa occurring in a boy aged 4 months and a girl aged 6½ years are reported In both patients the illness began with an infection In one the diagnosis was virus pneumonia in the other scarlet fever Necropsy was performed in both Microscopic sections of the coronary arteries, vessels of the kidney spleen, and adrenal gland revealed the typical lesions of polyarteritis nodosa as originally described by Kussmaul and Maier and more recently by Arkin It seems most likely that hypersensitivity plays an important part in the etiology of polyarteritis nodosa and that the *sensitivity may be related to the* products of infection bacteria virus, or any other antigenic substance

*Mesantoin in Difficult Cases of Epilepsy E E Houfek and H T Hermann—p 234

Mesantoin® in Epilepsy *—This study is concerned with* 19 out patients of the Epilepsy Dispensary of the University of Nebraska All 19 were treated with mesantoin® (3 methyl 5 phenyl 5 ethyl hydantoin) In 17 toxic reactions had previously developed, or they had become refractory to other medication Eleven patients had idiopathic grand mal epilepsy two had Jacksonian seizures, one had grand mal following encephalitis, one had psychomotor epilepsy, three had a combination of grand *mal and petit mal*, and one had a functional type of seizure probably psychomotor Five discontinued the use of mesantoin,® one because exfoliative dermatitis developed, two because of skin rash, one because of wooziness, and one because of unavailability of the drug Of the remaining 14 patients all were helped *some becoming seizure free Thus mesantoin®* has proved helpful in patients not responding to other drugs When this drug is given, the following precautions should be taken blood cell counts should be made monthly, and patients should be watched for skin rash and told to report if untoward effects are noted The combination of mesantoin® with trimethadione (tridione®) is to be avoided and with phenthenylate (thiantoin") is probably to be avoided Mesantoin® combined with diphenyl hydantoin (dilantin®) sodium and phenobarbital has proved effective in cases resistant to other medication

*Treatment of Pruritus Ani R F Dickey—p 568

Treatment of Pruritus Ani—Pruritus ani may be initiated by disturbed bowel function trauma from harsh toilet hygiene hemorrhoids, drug irritation, sweating, and intertrigo Associated pathological entities include anal fissures cryptitis, papillitis, hemorrhoids fistulas redundant perianal tissues, pilonidal cysts, and sinuses Careful examination and history taking are necessary for proper diagnosis and treatment The author is convinced that in most cases nervousness is a result rather than the cause of pruritus ani Proper cleansing of the anal area is the most important therapeutic measure Patients must be instructed to cleanse the anal area three times a day *After detergent cleansing the* areas must be rinsed with a cotton ball *moistened with cold water* and then patted dry then if the patient has moist pruritus ani, he should apply an aluminum hydroxide gel thickened with kaolin, which absorbs moisture and seems to inactivate irritants The dry type of pruritus ani responds well to the weekly application by the physician of a mixture of one part trichloroacetic acid to three or four parts of water or cresol (lysol®) As soon as the area turns white the action is neutralized by a drying lotion The patient then uses the cleansing technique and applies an ointment Pruritus ani in which there are no pathological changes may be psychogenic may be due to disturbances in the lower gastrointestinal or genito-urinary tracts, or may be the result of systemic diseases Relief depends on control of the causative diseases For the temporary control of pruritus cold compresses or an ice bag are most effective Patients must be made to understand the harmful action of repeated rubbing and scratching

Radioiodine Concentration Test —The ability of the thyroid gland to concentrate orally administered radioactive iodine (I^{131}) is regarded as a measure of its activity This test was performed on 115 normal subjects, 25 thyrotoxic patients and 19 hypothyroid patients to evaluate it as a routine diagnostic method The normal thyroid was found to concentrate between 10 and 35% of the administered dose The results in 13% of the normal subjects were below and in 10% were above these limits All the hyperthyroid patients concentrated 35% or more, and all the hypothyroid patients concentrated 10% or less The radioiodine test was found to be more than twice as accurate as the basal metabolic rate in the recognition of normal thyroid function and was equally diagnostic in thyroid disease A single 24 hour reading after the administration of radioactive iodine was found to be adequate for routine diagnostic studies

Remarks About Ulcer and Ulceriform Cancer of Stomach R A Gutmann —p 448

Aureomycin in Ulcerative Colitis.—Thirty-eight patients with active ulcerative colitis were treated with aureomycin in doses averaging 250 mg every eight hours In 31 there was reduction in bowel movements of 50% or more In 24 of 32 cases gross blood in stools disappeared Thirty three patients reported significant improvement in the sense of well being, including greater strength less pain and tenesmus Gain in weight (three to 28 lb [1 3 to 12 7 kg]) was reported in 14 patients weight loss occurred in six patients The sigmoidoscopic appearance was improved in 15 of 34 patients Six to 24 months follow up of 30 cases showed 21 patients to be well five improved two unimproved and two with malignant tumors When four patients whose diarrhea was controlled with aureomycin were given placebos the diarrhea promptly recurred in three Improvement again followed when treatment with aureomycin was resumed Nausea occurring in seven patients was controlled by milk or a bismuth subsalicylate mixture (pepto-bismol®) which do not interfere with absorption of aureomycin While the results here reported are most encouraging continued caution is urged in interpreting the ultimate value of aureomycin in ulcerative colitis therapy When medical management fails in the presence of gross pathological changes surgery is indicated The authors feel that aureomycin is the most satisfactory drug now available for the treatment of chronic idiopathic ulcerative colitis

Therapy of Peyronie's Disease.—During 40 years of practice Burford and associates observed 124 patients with Peyronie s disease (penile induration) The ages ranged from 22 to 84, but two-thirds of the patients were in the fifth and sixth decades A faulty connective tissue metabolism seems to play an etiological role, but the authors feel that trauma also should be considered although its role has been minimized The following conditions were mentioned as possible casual factors in 48 of the cases reviewed by the authors gonorrhea and/or chancre in 19 blow or other injury in 10, "break" during erection in sleep or intercourse in 7, urethral manipulations in 4, stricture of urethra at site of fibrosis in 3, presence of Dupuytren s contracture in 3 surgical removal resulting in intensification in 1 and penile blood clot in 1 The lesion usually appears as a pearl gray, glistening, scarlike tissue, from 3 to 5 mm in thickness and with a striated appearance, but some portions are nodular Surgery roentgen, and radium rays and tocopherols have been the treatments most frequently recommended in recent years The authors employed radium treatment in 91 of their 124 cases The dosage ranged from 50 mg hours to 325 mg hours The average was 120 mg hours for a single treatment Sixty of the 91 patients received only one treatment Complications in the form of indolent weeping and persistent ulcer resulted in three of the cases Surgical excision was successful in two of these three The authors believe that on the whole the use of radium has been safe and effective Recently they combined its use with tocopherol medication and concluded that this combination therapy is even more effective

Prevention of Pertussis by Vaccination.—Ten controlled field trials were made in five different areas to assess the prophylactic value of pertussis vaccine in children Of 7,558 children between the ages of 6 and 18 months whose parents consented to take part in the study, 3,801 were inoculated with pertussis vaccine (referred to as the vaccinated group), and 3,757 were given a similar dose of "anticatarrhal" vaccine, which contained no Hemophilus pertussis (referred to as the unvaccinated group) Although the two groups were formed by random sampling, they proved to be strikingly similar in average age, average number of children in the families, and the average duration of observation Five batches of pertussis vaccine were tested With only a few exceptions there were no severe local or general reactions to inoculation None of the children had convulsions, and in none did poliomyelitis develop within two months of inoculation In all the trials, 149 vaccinated and 687 unvaccinated children developed pertussis The corresponding attack rates per 1,000 child months of observation were 1 45 and 6 72, giving a reduction in the incidence of disease of 78% Among children exposed to pertussis in their own homes the attack rates were 18 2% in the vaccinated and 87 3% in the unvaccinated group The cases that occurred in the vaccinated children were on the average less severe and of shorter duration than those in the unvaccinated children During the two to three-year follow up periods there was no evidence of a waning in the degree of protection afforded by the pertussis vaccines Swabs were taken from 806 (96 4%) of the 836 clinically diagnosed cases, and in 482 (59 8%) bacteriological confirmation was obtained Each batch of vaccine gave substantial protection but the two batches supplied by the Michigan Department of Health gave a much greater degree of protection than the others Vaccines prepared in Great Britain according to the method used by the Michigan Department of Health are now being tested in similar field trials

*Surgical Treatment of Mitral Stenosis. C. Crafoord F Berglund H Ellasch and L. Werkö —p 831
*Early Diagnosis of Huntington's Chorea with Special Attention to Psychiatric Symptoms. C L. Laane.—p 835
Arteriography of Lower Extremities H E. Leschly Jacobsen and J Raun Byberg —p 840

Chronic Cor Pulmonale.—In 1945 chronic cor pulmonale, defined as strain and hypertrophy of the right side of the heart resulting from various chronic lung diseases and from hypertension in the lesser circulation, was diagnosed in 1 6% of 1,194 patients admitted to one division of the Rikshospital and in 7 6% of the patients with cardiovascular diseases The transition from predominantly pulmonary symptoms to the stage in which signs of strain or insufficiency of the right heart begin to appear is often not noted Right heart failure usually occurs after aggravation of the pulmonary symptoms Prominence of the pulmonary arch, best seen from the right oblique view, is the first roentgenologic sign of chronic cor pulmonale Other roentgenologic signs are dilatation of the right ventricle, increased caliber of the pulmonary arteries, and the absence of peripheral pulmonary stasis When roentgenologic differentiation between the cardiac changes in chronic cor pulmonale and those in congenital heart disorders is difficult, diagnosis depends on catheterization and angiography Severe cyanosis ("black cyanosis") and edema of the neck and head, signs of emphysema, and pulmonary changes suggest cor pulmonale The electrocardiogram is decisive here Chronic cor pulmonale is of relatively short duration and responds poorly to treatment With energetic treatment of the underlying pulmonary disorders, prevention of infections in the respiratory tract, and digitalization of patients with cyanosis, dyspnea, and palpitation of the heart on slight effort, the condition may be improved and the insufficiency warded off for a longer time Early digitalization is important, particularly since the treatment often fails after insufficiency sets in Patients with chronic cor pulmonale should when possible spend the winter in a milder climate After signs of insufficiency have appeared all means must be employed to control the insufficiency and anoxemia, as this type of insufficiency is often acute Sedatives must be given with the greatest care Morphine is strictly contraindicated because of its marked depressant effect in chronic cor pulmonale

Surgical Treatment of Mitral Stenosis.—Crafoord and his associates report seven cases of mitral stenosis in which commissurotomy was done, in six with dilatation of the mitral valve with the finger, in one instance with Bailey's knife All patients had cardiac catheterization before operation In the cases with digital dilatation of the valve, marked decrease in the pressure in the pulmonary circulation followed, with return to almost normal in two cases In all cases the brachial arterial pressure and the cardiac output increased In two cases with arterial saturation below normal before the intervention the values were normal afterward. There was notable subjective improvement in all cases Postoperative mitral insufficiency occurred in the case treated with Bailey's knife Commissurotomy is believed to be indicated in cases of pure mitral stenosis with signs of pressure in the lesser circulation and with poor filling of the left chamber. It is contraindicated in cases with rheumatic fever or other infections, other valvular defects, and insufficiency of the right heart that does not respond to treatment

Early Diagnosis of Huntington's Chorea—Eight cases of hereditary chronic progressive chorea (Huntington's chorea) treated at the University Psychiatric Clinic in Oslo from 1940 to 1951 are discussed by Laane. They illustrate the difficulty of correct diagnosis in early cases Disturbances in gait and in speech, perioral tremor and pain in the back and lower extremities are early neurological symptoms Psychiatric symptoms may appear a number of years before there are pronounced neurological symptoms Early diagnosis is important A family history of the disorder should be looked for Since this is such a grave disease and leads to severe disability, these patients should not have children Shock treatment has no effect on the disease and is dangerous Electroencephalography in three cases failed to give a characteristic picture Early institutional treatment is recommended

Acute Radiation Sickness Review of Pathogenesis Clinical Symptoms and Treatment J E Thygesen —p 655
Case of Pellagra in Connection with Tuberculosis of Small Intestine with Multiple Strictures E Trier and H Brocks —p 669
Treatment of Fractures and Dislocations in Cervical Spine T Hølund —p 672
Meigs Syndrome V Petersen —p 675

Acute Radiation Syndrome Pathogenesis, Clinical Symptoms, and Treatment —Thygesen says that the term acute radiation syndrome means severe radiation sickness produced by massive universal irradiation for a short period The untreated clinical course of the acute radiation syndrome shows three fairly well defined forms the fulminant form the hemorrhagic and the pancytopenic In the fulminant form, after superlethal doses (several thousand roentgens), death occurs in a few hours in lethal doses, (600 1500 r) a shocklike condition is succeeded by vomiting, diarrhea fever and prostration with dramatic progression and death at the latest from seven to 10 days after exposure In the hemorrhagic form after less but still lethal exposure (300-600 r), nausea, vomiting and prostration are followed by some well being for 10 to 14 days after which there is increasing illness, often preceded by epilation with massive hemorrhage from the mucous membranes, ulcerations in mouth and intestines and flare up of the gastrointestinal symptoms Hemorrhagic agranulocytic necrotizing pneumonia often develops Death usually occurs from three to six weeks after exposure The pancytopenic form is most frequent after moderate doses (100 300 r) In from three to five weeks, alopecia, slight inflammation of mouth and throat, and weakness set in In most cases where aplastic anemia leads to a fatal outcome this occurs from two to four months after exposure Many patients survive The four stages now recognized in the clinical picture of the radiation syndrome are the initial, latent recrudescence and debility stages The duration of the latent stage is inversely proportional to the dose, the higher the dose, the shorter the latent period Epilation, easily observed diagnostically and a prognostically important sign with development of the monk s tonsure' may appear from two to five weeks after exposure Alopecia in a person suspected of having been exposed to irradiation injury is a probable sign of radiation effect usually expressed in the hemorrhagic form In the fulminant form death precedes epilation In the pancytopenic form the duration of epilation is a valuable prognostic sign as the hair is rapidly restored in surviving persons The pathogenesis of the radiation syndrome is not fully understood so that adequate treatment is not yet possible Supportive and symptomatic treatment is far from hopeless It should be remembered in the care of uncomplicated cases that all circumstances that increase the metabolism seem to increase the mortality Careful attention and psychic encouragement are important

63 393 412 (June 1) 1951

*Isolation of Virus in Several Cases of Boeck s Sarcoid S Löfgren and H Lundbäck —p 398
Early Diagnosis of Focal Dissemination K Gotsch and E. Kresbach —p 401
Slow Course of Cerebral Glioma Despite Progressive Malignancy H Lill —p 403

Isolation of Virus from Patients with Boeck s Sarcoid —The gastric irrigation fluid of 10 patients three with chronic pulmonary sarcoidosis, five with bilateral hilus lymphoma, which the authors consider as the initial stage of pulmonary sarcoidosis and two with cutaneous sarcoidosis, was inoculated into the amniotic or allantois cavities of impregnated chicken eggs The eggs were eight days old at the time of the inoculation They were incubated for four to eight days The fluids were then pipeted from the eggs and agglutination tests with suspensions of chicken blood corpuscles as well as complement fixation tests with suitable serums of patients were performed with various groups of eggs on which five passages were carried out Two to four blind passages were required before agglutinins could be demonstrated A virus was isolated by this technique from seven of the 10 patients with sarcoidosis Complement fixation tests showed that the isolated virus was either identical with or very similar to the mumps virus Viruses with similar serologic characteristics were isolated in three of eight cases of malignant lymphogranulomatosis The isolated virus strains gave positive complement fixation reactions with the serums of patients with sarcoidosis but the titers were low, and they might have been caused by previous mumps No definite increase in the complement fixation titer could be demonstrated in the course of sarcoidosis but a definite lowering of the titer was observed in many cases in the course of the disease Patients with sarcoidosis gave a cutaneous reaction to the dead virus The authors results do not solve the etiological problem of sarcoidosis but justify further studies of the same type

Problem of Wound Infection in Henle Albee Operation W Legal —p 640

Effect of Thorium X on Growth —Even before World War I thorium X was used in the treatment of chronic polyarthritis lymphatic and myeloid leukemia and arteriosclerosis Since 1943 it has been used in a compound form in the treatment of tuberculosis of bones and joints and since 1946 it has been used in spondylarthritis ankylopoietica With this compound bands of greater density in the metaphysial lines particularly in the distal ulna radius the distal femur and the proximal and distal tibia fibula metaphyses, develop in children To clarify these roentgenologic changes in the growth lines (metaphyses) studies were made on growing rabbits with the thorium X compound After the rabbits had been treated from 10 to 16 weeks their increase in weight as well as in length was less than normal Selective deposition of thorium X in the metaphysial growth lines causes irradiation induced impairment of the metaphysial cartilage and causes, in all the growth lines chiefly involved in longitudinal growth a thickening of the cartilage and a widening of the zone of calcification in the cartilaginous substance The zone of calcification corresponds to the metaphysial bands of densification in the roentgenograms of joints and ribs Under the action of thorium X the calcium salts of the bone tissues decrease and spontaneous fractures result The disturbance in the endochondral ossification the decalcification of the bone and the selective deposition of thorium X in the newly calcifying or ossifying tissues suggests that thorium X therapy is inadvisable in diseases involving ossification of tissues It should not be used in pregnant women or in children

Arthrodesis of Hip Joint.—Witt describes a technique for surgical arthrodesis of the hip joint He shows that with the spreading nail he has designed fixation is better development of an adduction position is avoided immobilization in a cast can be either shortened or completely avoided hip arthrodesis is possible in very old patients and wandering of the nail is impossible The surgical intervention is simple and not extensive, being no greater than that involved in an extraarticular nailing of the neck of the femur The author s spreading hip nail is three flanged and has a perforation for a second nail, so that the tips of the two nails are 3.5 cm apart after complete insertion Since the nails are tightly screwed together, the fixation of the head of the femur in the acetabulum is secure

BOOK REVIEWS

Clinical Electrocardiography By Ashton Graybiel Captain MC USN Director of Research U S Naval School of Aviation Medicine Pensacola, Florida. Cloth $5 Pp 198 with 140 illustrations Thomas Nelson & Sons 19 E. 47th St New York 17 Parkside Works Dalkeith Road Edinburgh 9 3 Henrietta St London W C 2 1950 1951

This monograph is an expansion of a chapter previously published in Nelson s Loose Leaf Medicine The author has utilized this occasion to attempt an expanded presentation of the electrocardiogram in simple fashion He has made use of the principles of vectorcardiography primarily as it pertains to the frontal plane He has used the V limb lead together with the standard limb leads so that he can define the leads as placed 30 degree angles apart in one half the 360 degrees of a circle lying in the frontal plane He starts with aVL then follow I aVR↓ (aVR mounted upside down) II, aVF and III By using the transition zone of QRS and of T he is able to project their frontal vector He has developed a system whereby he can give the V limb lead the same magnitude as the ordinary limb leads (he calls these vV leads) He has used a similar approach for the precordial leads Much of this development is based on the concepts recently put forth by Grant and his associates for simplified vector analysis The author recognizes the approximate character of this methodology but believes that it has clinical utility It is a departure as far as the precordial leads are concerned from the semidirect concept of the Wilson school

With this background the author discusses the normal limits of the electrocardiogram the abnormalities in their appearance and the effect of certain physiological alterations and certain diseases on contour There is the usual presentation of arrhythmias The monograph is recommended not alone for the beginning student in electrocardiography wishing to get an idea of recent trends but also for the more advanced student to show him some of the limits of previous concepts of electrocardiography The author has kept his responsibilities in mind and has succeeded in, as he says a serious attempt to simplify without sacrifice of effectiveness the subject of clinical electrocardiography

Patterns of Disease on a Basis of Physiologic Pathology By Frank L. Apperly M A M D D Sc Professor of Pathology Medical College of Virginia Richmond Virginia Cloth $8 Pp 456 with 87 illustrations J B Lippincott Company 227 231 S 6th St Philadelphia 5 Aldine House 10-13 Bedford St London W C 2 2083 Guy St Montreal 1951

This book reflects the recent trend of integrating several originally separated disciplines In this instance a treatise developed from lectures on pathology to medical students covers as a unit many aspects of clinical medicine It is based on the principle of discussing the patterns of diseases as a whole and tracing them step by step through biochemical changes altered function altered anatomy and final outcome Furthermore the significance of the compensatory mechanisms stimulated by disease is emphasized in the clinical and pathological picture Thus anatomic and clinical pathology are interwoven with physiology and clinical symptomatology

In the first part which would correspond to general pathology the passive changes in disease, represented by disturbances of nutrition and peripheral circulation are discussed followed by a broad analysis of reactive changes to injury including all aspects of the problem of inflammation Pigmentation degeneration and tumors are then discussed Following is a discussion of the diseases of the different organ systems the major portion of the book Many intelligently arranged and original tables are used to show often in an original fashion the correlation between the various physiological and pathological factors Most of the illustrations (used sparingly for a textbook on pathology) are schematic drawings that are well-done The arrangement is exceedingly clear and specific information can be found quickly The diction is clear, concise and stimulating A large amount of factual information is compressed into a small space Many of the statements are deliberately dogmatic, so that the inexperienced will not be confused References to the literature are entirely omitted, and little attempt has been made to mention the names of those responsible for our present knowledge

One questions the place of this well written and intriguing book in medical teaching As a mere introduction to pathology, it is too detailed and does not discuss enough of the philosophy of the subject It is typical of the present trend of emphasizing function and deemphasizing morphology The question arises whether this trend is not carried almost too far here, in view of the statement structure without function is meaningless The student should not be deprived of knowledge of structures the function of which may only be known in the future It would be regrettable for medical students not to receive more detailed information of orthodox pathology and to be deprived of bibliographical references for further study Nevertheless the stimulating arrangement and presentation recommends this book as excellent collateral reading for the medical student and the practitioner seeking information in conjunction with one of the standard textbooks on pathology

Handbook of Medical Management By Milton Chatton A B M D Instructor in Medicine University of California Medical School San Francisco Sheldon Margen A B M D Clinical Instructor in Medicine University of California Medical School and Henry D Brainerd A B M D Assistant Clinical Professor of Medicine and Pediatrics University of California Medical School Second edition Cloth $3 Pp 507 University Medical Publishers Post Office Box 761 Palo Alto California 1951

This edition of a useful manual of clinical treatment looks smaller than the first edition but actually it has even more facts on its thinner pages Although the content is similar to that of the first edition, with chapters on the general aspects of medical management and then serially throughout the rest of the book, nearly all the common diseases, grouped according to etiology or system, there is a great increase in new detail on certain subjects This is particularly true for the new antibiotics and for corticotrophin (ACTH) and cortisone The book is not at all for systematic reading but is rather an extremely handy summary of techniques and treatments Both the beginner and the experienced practitioner in medicine will find it a most satisfactory guide

Modern Trends in Neurology Edited by Anthony Feiling B A M D F R C P Senior Physician Neurological Department St. George s Hospital London Cloth $13 50 Pp 717 with 202 illustrations. Paul B Hoeber Inc (Medical book department of Harper & Brothers) 49 E. 33rd St New York 16 1951

This sizable book has been prepared to present in concise form some of the more interesting and valuable additions to neurology of recent years The authors are well known figures in neurology in Great Britain and the United States The subjects dealt with are varied As is to be expected the chapters are of unequal quality For the most part they are thorough going utilitarian discussions A few, notably Chapter 2, on the frontal lobes and 4, on cerebral palsies of infancy, are poor The former is confused It is lacking in a clear statement of either the author s views or those of the investigators whom he castigates This entire chapter is characterized by the lack of discernment that is common to arm-chair" critics Chapter 4 is overly concerned with terminology and classification The essential facts are not clearly presented

Chapter 10, on abscess of the brain, and Chapter 11 on intracranial tumors are the best of the entire book The chapter on syphilis of the nervous system is indecisive The author seems to lack sufficient personal experience to permit definite opinions of his own The chapters on headache, myasthenia gravis, epilepsy electroencephalography, and neuroradiology are interesting and well prepared That on ruptured intervertebral disc has been prepared by W J Mixter, the dean in this field, and is well done One regrets however, the omission of a thorough

---

The reviews here published have been prepared by competent authorities and do not represent the opinions of any official bodies unless specifically stated

going discussion of the midline herniations in the lumbar region with severe compression of the cauda equina and in the cervical region with implication of the cervical spinal cord

There are throughout the book a number of statements to which one must take exception For example "immodesty is common" after frontal lobotomy (page 75) patients with migraine handle responsibility poorly (page 109) lumbar puncture when undertaken without due precaution has frequently introduced organisms into the subarachnoid space and caused meningitis (page 163) sulfathiazole is the sulfonamide of choice in treating meningococcic meningitis (page 171) protein in the spinal fluid is usually increased only to 100-200 mg per cent in the Guillain Barre syndrome (page 212) treatment of syphilis of the nervous system with penicillin is associated with little or no risk angiomas on the medial surface of the posterior half of the cerebral hemisphere are, of course, supplied by the anterior cerebral artery (page 632), it is only careless technique if one fails to outline the ventricles by either ventriculography or encephalography (page 649), the commonest lesion in the spinal extradural space is an abscess (page 661) One also looks in vain for a discussion of the various infectious diseases and blood dyscrasias that are not infrequently associated with the Guillain Barré syndrome (pages 212 213) Most neurologists have discarded guanidine as of little if any value in the treatment of myasthenia gravis (page 506) The description and discussion of psychomotor attacks (page 572) is hardly adequate Vertebral angiography cannot be briefly dismissed, and the limitations listed by the author either are not correct or are not pertinent Obviously these are all minor isolated points and do not reflect unfavorably on the obvious worth of the book as a whole

Die Blutgerinnung in Theorie und Praxis Von Dozent Dr Josef Schmid Assistant der II medizinischen Universitätsklinik in Wien Band IV Wiener Beiträge zur inneren Medizin herausgegeben von Dozent Dr Hanns Fleischhacker Cloth $12 Pp 444 with 135 illustrations Wilhelm Maudrich Spitalgasse 1B Wien IX/2 1951

This well-organized book represents an attempt to compile the world literature concerning all problems related to blood coagulation, including the scientific as well as the practical clinical aspects The extensive Anglo-American literature in this field is thus made available to the German reader The data presented are fairly complete Where possible the clinically important facts are emphasized and existing arguments are pointed out The various activating and inhibiting factors in blood coagulation are individually discussed In addition clot retraction fibrinolysis and hemolysis are presented in separate chapters Additional chapters often with a historical review are devoted to hemophilia thrombopenia thrombosis, and other diseases with disturbed blood coagulation The modern therapeutic applications are clearly pointed out Special care has been given to a good description of methods in use which is documented by a large number of graphs The relative completeness of the available information makes this book a valuable reference also for the American scientist and physician

Lumbar Puncture and Spinal Analgesia. By R R Macintosh M A D M D A Nuffield Professor of Anæsthetics University of Oxford Cloth $4 50 Pp 149 with 111 illustrations by M McLarty Williams & Wilkins Company Mount Royal and Guilford Aves. Baltimore 2 1951

The author of this book is well known for his publications dealing with the teaching of fundamentals in anesthesia by the pictorial method This volume represents another valuable contribution which is greatly enhanced by the many excellent illustrations The essential objectives of this publication are to provide a technical guide for physicians learning the fundamentals of lumbar puncture and spinal analgesia and to aid surgeons who though expert in lumbar puncture are unfamiliar with the basic principles and management of spinal analgesia

A brief presentation of the early history of spinal analgesia is followed by a concise review profusely illustrated of the basic anatomy involved in this type of analgesia as well as a detailed discussion of cerebrospinal fluid A short but excellent chapter on sterilization forms a particularly valuable section of this book The technique of lumbar puncture is followed by consideration of the distribution of various analgesic solutions The final chapter on "Do s Don ts and Doubtful s" is preceded by a brief discussion of headache Emphasis throughout is on anatomic and physiological principles The pharmacologic aspect of spinal analgesia has but occasional consideration The work would be of greater value if this section were expanded including additional information regarding the relative toxicity and irritating qualities of various spinal analgesic drugs and solutions Previous authors are not in agreement with the views expressed in this book concerning the management of aseptic meningitis The volume is logically organized and well integrated An adequate number of important references appear at the close of each chapter The simplicity and clarity of this presentation should appeal to all who desire brief and basic information regarding lumbar puncture and spinal analgesia Printing and binding are excellent

Ocular Toxoplasmosis. By Michael J Hogan Associate Clinical Professor of Ophthalmology and Clinical Director of the Francis I Proctor Foundation for Research in Ophthalmology University of California Medical School San Francisco Cloth $2 75 Pp 86 with 28 illustrations. Published for American Ophthalmological Society by Columbia University Press 2960 Broadway New York 27 Oxford University Press Amen House Warwick Sq London E.C 4 1951

This monograph, prepared originally as a thesis for the American Ophthalmological Society, was considered important enough by the society to be issued as a special publication It summarizes well the current knowledge on toxoplasmosis as it affects the eye The principal involvement is retinitis or chorioretinitis usually in the macular or perimacular region which results chiefly from infection during intrauterine life A positive diagnosis is to be made on the basis of clinical findings with isolation of the Toxoplasma The author believes the complement fixation tests and methylene blue dye tests to be most reliable in arriving at a probable diagnosis

The author reports five cases of congenital toxoplasmosis and histological findings on the second eye in a case previously reported In experimental toxoplasmosis in rabbits there was localization of the lesion in the uveal tract when peritoneal exudate from Toxoplasma infected mice was injected into the carotid artery All drugs studied proved to be ineffective in controlling experimental toxoplasmosis in mice This well written volume is of importance to anyone interested in toxoplasmosis or in the prob'em of the etiology of uveitis

Primary Carcinoma of the Liver: A Study in Incidence Clinical Manifestations Pathology and Ætiology By Charles Berman M D B Ch Senior Medical Officer Consolidated Main Reef Mines and Estate Ltd Maraisburg Transvaal South Africa With foreword by Sir Ernest Kennaway *M D D Sc F R S* and introduction by Henry Gluckman M R C S L R C P Produced by means of grant from South African Council for Scientific and Industrial Research Cloth 35s Pp 164 with 83 illustrations. H K Lewis & Co Ltd 136 Gower St London W C 1 1951

This study is based on extensive clinical and pathological experience with hepatic cancer in the male Bantu in South Africa supplemented by investigation of many case records of cases occurring in this area as well as by a diligent and rather complete survey of the world literature on this subject

The result is a well-organized study from which information about hepatic carcinoma can rapidly be obtained Good illustrations assist in the presentation The book has four parts The first deals with the geographical and racial distribution of hepatic cancer It reveals that this disease is commonest among the Bantu tribe in South Africa less common in the Oriental races but here still of much higher incidence than in Western people The second part deals with clinical manifestations Frank acute abdominal febrile occult and metastatic forms are well-described Little optimism is exhibited concerning therapy The third part contains pathological description and it is emphasized that in the author s material cirrhosis was almost invariably present The fourth part deals with etiology The importance of environmental rather than genetic factors is emphasized (the incidence in the American Negro is low) Malnutrition leading to cirrhosis is considered the main etiological factor although others are not excluded Finally experimental production of hepatic cancer by carcinogens is relatively briefly reviewed The book is valuable because it makes readily accessible information that is otherwise widely dispersed

QUERIES AND MINOR NOTES

TREATMENT OF DRUG ADDICTION

To THE EDITOR —*'Merck's Manual,' 8th edition (page 1104) outlines a method of treatment for drug addiction according to the methadone withdrawal schedule Can such treatment be successfully carried out in a physician's office in mild cases? How can addicts be helped especially those who refuse to be hospitalized at Louisville?* *M.D New York*

ANSWER —The usefulness of methadone hydrochloride in the withdrawal treatment of heroin and morphine addiction was established at the United States Public Health Service Hospital in Lexington, Ky , and continues to be the best method, it is in daily use there as outlined in 'Merck's Manual ' Withdrawal in cases in which physical dependence has been established should be attempted only in a closed hospital situation Persons who have used heroin intravenously or intranasally several times daily for several months will certainly have established physical dependence Proof of this would be in the appearance of recognized withdrawal signs if the drug is withheld for 24 hours Narcotic addiction, of course, usually represents a symptom of an underlying personality disorder, and, as is frequently the case in this type of illness, there may be little insight and little desire for treatment Unless he is compelled by court procedure to undergo treatment, the patient must be persuaded that his addiction is a serious enough condition to justify his taking several months of his life in order to obtain the necessary hospital treatment Application for voluntary treatment at the Public Health Service Hospitals in Lexington, Ky , and Fort Worth, Texas, may be addressed to the Medical Officer in Charge of either institution As voluntary patients they may demand their release against medical advice before completing treatment but, if readmission is subsequently sought, they must commit themselves through local court action, which is legally possible only at the Lexington hospital because of an existing Kentucky law

The addict seeking gradual withdrawal treatment as an office procedure may be sincere but ignorant concerning such treatment or may be using one or more physicians as a source of drugs to continue his habit A physician who prescribes drugs for the office withdrawal of addicts must expect to be closely scrutinized by federal narcotic agents, who believe that hospital withdrawal is the only feasible procedure

TESTS FOR INCOMPLETE RH ANTIBODIES

To THE EDITOR —*In following an Rh-negative multipara through a pregnancy, can one rely on a negative blocking antibody test alone if performed regularly throughout the pregnancy?*

M D , Illinois

ANSWER —A variety of tests are in use for the detection of blocking or incomplete Rh antibodies antenatally in the serums of Rh negative multiparas Of these tests the least sensitive is the blocking test, the conglutination test is more sensitive, while the most sensitive tests are the antiglobulin test and tests with enzyme treated cells If the results of the most sensitive tests namely, the antiglobulin tests and/or test with enzyme treated cells, are negative, one may predict with certainty that the baby, even though Rh positive, will not be erythroblastotic, provided that other rare sensitizations, such as to the A and B agglutinogens or Kell factor, are also excluded When the result of the conglutination test is negative, but results of tests with enzyme treated cells or with the anti-globulin method are positive, the Rh positive baby will as a rule be so mildly affected that no treatment will be required When results of tests with the conglutination method are distinctly positive, the Rh positive baby will generally be affected, and the severity of the manifestations tend to parallel the antibody titer, though notable exceptions occur Positive results of the least sensitive method, namely, the blocking test, are usually of grave prognostic import, because this is often followed by a stillbirth or a severely affected erythroblastotic baby, though again exceptions may occur

RABIES VACCINATION FOR DOGS

To THE EDITOR —*Will a single shot' of rabies vaccine protect a dog from rabies? A local epidemic of rabies among wild animals prompts the question* *M.D , North Dakota*

ANSWER —The single injection method of rabies vaccination has been proved through long experience to provide adequate protection for dogs Annual revaccination is recommended, although it is possible that some of the newer vaccines will give immunity for considerably longer than one year During World War II, the United States Army Veterinary Corps had outstanding success with the three injection method of immunization (a course of three weekly injections) in dogs used by the armed forces, but this method cannot be recommended where public cooperation is required

TREATMENT FOR FRESH WOUNDS

To THE EDITOR —*Assuming that all other factors, such as suture material and gentleness are equal and as near ideal as possible which of the following methods is preferred in the treatment of fresh, clean intentional wounds in human beings (1) dry gauze for sponging without any irrigation of the wound, (2) sponges moistened in water and no irrigation (3) sponges moistened with water and irrigated with water, (4) sponges moistened in saline and no irrigation (5) sponges moistened in saline and irrigated with saline (6) sponges moistened in Ringer's solution and no irrigation, or (7) sponges moistened in Ringer's solution and irrigated with Ringer's solution?* *M.D Kentucky*

ANSWER —A fresh, clean intentional wound is best treated only with sponges moistened with isotonic (0 9%) sodium chloride solution Water should not be used, and Ringer s solution has no added advantage

NOCTURNAL CRAMPS

To THE EDITOR —*I have felt that the use of vitamin B in nocturnal cramps might help correct abnormal physiology in the muscle tissue but have been unable to substantiate this In vitamin B deficiency there is incomplete oxidation of glucose in muscle tissue with an increase in pyruvate in the blood Does this mean a local increase of pyruvic acid occurs in muscle in vitamin B deficiency? Would an increase of pyruvic acid in muscle tissue cause abnormal and sustained muscle contractions? What is the physiology of pyruvic acid in the human body?* *J R Burnett, M D , Effingham, Ill*

ANSWER —Peripheral neuritis is the most common pathologic lesion of thiamine deficiency, and tenderness of the muscles, notably in the calves, is often a striking symptom Cramps in the muscles have been complained of by patients suffering from grave and long-continued nutritive deficiency, notably of the vitamin B complex, but it is doubtful that the nocturnal cramps referred to, occurring under a variety of conditions, could be due to the accumulation of pyruvic acid in the muscles This substance increases in the body fluids during the altered metabolism of thiamine deficiency, but there is no evidence of a 'local increase of pyruvic acid" in muscle tissue The difficulties of thiamine deficiency go much further than the mere accumulation of the pyruvates The fate of pyruvic acid in the body is a long chemical story, adequately dealt with in the second edition of the 'Handbook of Nutrition" of the American Medical Association prepared under the auspices of the Council on Food and Nutrition (page 57)

The answers here published have been prepared by competent authorities They do not, however, represent the opinions of any official bodies unless specifically stated in the reply Anonymous communications and queries on postal cards cannot be answered Every letter *must contain the writer s* name and address, but these will be omitted on request

RESPONSIBILITY OF THE SURGEON TO MODERN SOCIETY

CHAIRMAN'S ADDRESS

I S Ravdin, M D, Philadelphia

In the selection of a subject for the chairman's address to this section, I have taken one which does not deal with great achievements of surgery These are well known to our colleagues in the various branches of medicine and to the lay public as well, they need no praise, for they have added immeasurably to the comfort and well-being of our people In the therapy of some diseases and abnormalities internal medicine has become more and more surgical, while in others nonsurgical means of therapy now provide a safer and better means of achieving health than operation ever afforded The surgeon has long been sensitive to the changing therapy of disease, perhaps more so than his strictly medical colleagues

In the attack now being made on American medicine surgeons unfortunately have provided a considerable amount of the ammunition which is being used by those who would destroy medicine as it is, and should be, practiced In these days of uncertainty, it is incumbent on all of us to realize our duties and responsibilities to modern society We can no longer evade them, we can no longer remain silent about them, for to do this is to shirk our duty What I have to say applies to but a small segment of American surgeons, but the actions of this small group are now reflecting on surgeons as a whole

If surgeons are to improve their position in our modern society, if they are only to maintain the position which they have previously held, they must concern themselves with certain of these problems The very cornerstone upon which our democracy was founded was the rights of the individual Among those rights is that of every patient to expect good medical and surgical care The most thoughtful men in American medicine have accepted this principle for generations Such unanimity of opinion on any other precept has rarely been achieved in our democracy All surgeons can be held responsible for the derelictions of a small segment of our profession if we fail to attempt to do something about them

Many of the problems which now confront us are not new They confronted the Founding Fathers of this country and their fathers before them The earliest code of Hammurabi, promulgated 2,250 years B C, prescribed the conditions of practice and defined the fees which the physician could charge

Thoughtful surgeons are concerned with the fact that our hospitals and medical schools are accumulating mounting deficits We frequently record the fact that the rich and near rich no longer give freely to these institutions so necessary to our modern society And yet, a few surgeons are constantly alienating such people from providing the help which we have a right to expect them to give The truth is that some surgeons fees are higher than they ought to be This is true now, and it was true in Rome in the fourth century B C for it was recorded then that "   *where there is a question of fees, the medical officer must take as a standard not what men fearing death will agree to pay, but what men recovered from illness will offer* "

It is interesting to be reminded in retrospect that many of the problems that seem so new to us today are in reality old ones It merely is illustrative of the fact that the best men in our profession are frequently held responsible for the acts of a few inconsiderate men On Oct 21, 1639, the Colonial Assembly of Virginia took into consideration the excessive rates and prices exacted by practitioners of medicine and surgery To quote from the Ninth Act of the Assembly,

> It so happening through the said untolerable exactions that the hearts of divers masters were hardened rather to suffer their servants to perish for want of fitt meanes and applications than to employ griping and avaracious men It being apprehended by such masters who were more swaved by politic respects than by Christian duty or Charity Yet it must be admitted that the charges of the physician or surgeon exceed for the most part the purchase of the patient

The subject arose again and again, and in 1661 and 1736 colonial Virginia took further cognizance of the excessive and immoderate prices "exacted by diverse avaricious and griping practitioners in physic and surgery " At no time did colonial Virginia cast aspersions on the entire profession

---

Read before the Section on Surgery General and Abdominal at the One Hundredth Annual Session of the American Medical Association Atlantic City June 14 1951

I was reminded of this aspect of our dereliction recently when a prominent lawyer came to see me He asked about a patient I had seen in consultation The patient had diabetic gangrene I advised amputation I saw the patient again several weeks later, the gangrene was above the knee I insisted that further delay was dangerous to life The amputation was done The surgeon sent a bill for $25,000 00 and the internist for $15,000 00 In medicine the adage of charging all the traffic will bear is immoral, and the surgeon who does this is doing a great disservice to his profession and to the institution in which he works The lawyer criticized the internist and surgeon severely, but how often do lawyers subject their clients to bills of this extent! It merely goes to prove that in our profession we are expected to be more sensitive to such immoralities, and we should be

We must admit that all is still not well in our profession We can never be sure that it ever will be, but we can, I am sure, continue to set standards which will remain the envy of the entire world We must be sure that the men who are permitted to do surgery, have been properly trained to do it To the extent that we fail in this objective, patients will not receive the full benefits which they have a right to expect Many patients are being subjected to needless operations, and preoperative and postoperative care is not always the best throughout the country as a whole The so-called successful surgeon is not always the best individual to do a particular operation, or to give the patient the full benefits that surgical science now has to offer Over and above all these matters, surgeons at times are not facing issues with their patients as they ought to face them—with candor, with honesty, and with a complete sense of the responsibilities which are incumbent upon the doctor to whom the patient entrusts his life These matters are of deep interest, not only to the patient—who, after all, is the consumer of the surgeon's effort—but to all those concerned with the best interests of medicine in this country These are matters which must concern the Fellows of this traditionally great Section

Surgical training varies greatly from one hospital to another A surgeon is never trained merely by assisting another surgeon, for to become technically proficient the young trainee must have the opportunity, under supervision, to do surgery He must, as his training is extended, be provided with increasing opportunity and responsibility In some institutions in this country, the responsibilities of the staff in the training program are not realized Young men following training frequently attach themselves, because of opportunity or necessity, to established surgeons They quickly assume the ways of working, the traits, good or bad, of the men with whom they are associated Accordingly, they will be either good or bad surgeons when on their own in the practice of surgery A deep realization of our responsibilities is necessary to all of us In no other way can we be sure that the young man who has completed his training will not default in either his capacity to do good for the public or his responsibility to the profession of surgery Technique will be learned at the operating table, judgment will be learned by years of training alongside men who have judgment, honesty of purpose, however, which is so important, will depend on the most careful selection of our trainees and upon the example to which we expose them

We hear much about fee-splitting in this country That it exists to a greater or lesser extent in many communities cannot be denied When fee-splitting is practiced, patients may be referred not to the surgeons best able to effect a cure, but to those who provide the referring physician with the largest share of the patient's fee We shudder when we read in our papers about the "kickback" in industry, and the "5 percenters", yet I wonder if all of us are at times lacking in social consciousness when we turn our backs on this iniquitous practice in surgery Young men recently out of the best of our surgical residencies often find it difficult to make a living if they resist the fee-splitting practice

Some answer must be found for the inequitable distribution of fees between internist or general practitioner and the surgeon, but the answer is not that of splitting fees The patient has every moral right to know what the fee he pays is for Young surgeons with principles must have the support of all of us in their attempt to establish themselves without succumbing to this practice The great organizations that represent surgery in this country must give more than lip service in disowning it, and individual surgeons who participate in this practice must be made to realize that they are destroying one of our most treasured possessions—the free conduct of our profession

It is frequently asked by patients and their families, "Is an operation necessary?" They have every right to ask this question It is asked frequently by thoughtful physicians and surgeons when they look at the schedules of operations in certain of our hospitals What are all the operations for chronic appendicitis, noncalculous cholecystitis and abdominal adhesions being done for? Are the organs which are being removed causing any of the symptoms which have brought the patient to the surgeon? Are not the adhesions at times due to a previous operation which in reality was not justified? The removal of an appendix for burning pain in the right lower quadrant will too often be followed by an operation for adhesions in six months or a year, and then by a cholecystectomy and another operation for adhesions Most of these operations are unnecessary, for the symptoms which these patients present are psychosomatic in origin, operation does not cure them

It is time we were frank about the "rape of the pelvis" The wholesale removal of ovaries and tubes and of uteri is all too frequently done without consideration of the harm which is being done the women involved Operations for retroversion are still being done by the hundreds for backache, and after operation, when the backache returns, the uterus is removed How often does a retroverted uterus really cause backache?

Recently I received a letter from one of my ex-residents about some of these practices He wrote

> Many undesirable practices have been encountered here as I am sure they must be encountered elsewhere I am happy to report to you that in spite of frequent temptations I have never compromised on a single principle I have turned down more surgery than I have done because I considered it unjustified even though the patients were referred for surgery I have angered a few by refusing to do ghost surgery which I consider to be a dreadful dishonesty but in so doing I have gained the respect of others When are you older men going to make the practice of surgery what it ought to be?

"Ghost surgery' in many of our communities has spread rapidly The general practitioner employs a surgeon to do the operation The surgeon sees the patient under the anesthesia in the operating room He has no part in the decision of whether operation is necessary, he does not control the postoperative care He lurks in the shadows selling his services The patient is led to believe that his own doctor did the operation, and very soon the doctor does begin to do such procedures, not because he is competent to do them, but because the patient believes he is and a hospital permits him to operate Such practices lead to the degradation of surgery It is fee-splitting in reverse It is not only immoral, it is dishonest

We must stop performing biopsies on breasts for chronic cystic disease in the absence of a dominant lump What do we gain by such a procedure? We must stop doing operations which cater to the whims of distraught patients, but which provide a poorer chance for five or 10 years' survival Conscience has been and must remain the motivating factor that controls our daily lives Recently a surgeon told a family that another surgeon who was to operate took too long for the operation, often did it in stages, and in the end would leave the patient altered for life with a "dreadful colostomy ' I cannot convince myself that the operation he recommended for a lesion 6 cm from the anus was as good as the traditional Miles operation

Consultants are often necessary but the tendency to call them when they are not required adds to the cost of medical care What is even worse is the tendency, at times resorted to of forcing the use of a particular group of consultants The patient and his family should have a free choice of consultants

All operators are not really surgeons The technical aspects of an operation represent but one facet of surgical care The surgeon must prepare his patient to withstand the assault of anesthesia and operation, and he must direct the postoperative care It is highly likely that more lives will be saved by intelligent preoperative and postoperative care than will be saved by variations in the methods used for a particular operation The decision of when to operate and what operation to *perform* are often matters of lifesaving character They are decisions which surgeons are prepared to make The operator skillful as he may be technically is often not as well prepared to make them

The responsibility of the surgeon should not cease when the patient leaves the hospital Follow-up studies carefully made are the only way of assessing the end results of our work We must recognize that careful follow-up studies provide the sole means of ascertaining the value to the patient of what we have done We must recognize that surgical care is only a part of the broad aspect of community care It must be always exercised in the public interest, and it usually is

Surgical mortality reporting is shockingly dissimilar throughout this country Editors must establish uniform criteria for mortality reporting but when all is said and done, mortality data are not the sole criteria upon which to pass judgment What is equally, if not more important is how long the patients live free of symptoms following a particular operation

I should also like to bring up the manner in which we continue to handle cancer in our discussions with patients A patient with a radical mastectomy or a permanent colostomy knows that he or she has had cancer and we fail to meet our obligation when we deny it What a relief, as a rule, it is to the patients when we are willing to discuss the future with them

These matters I have discussed are concerning many thoughtful people in and out of medicine and surgery It is for us to continue to formulate the policies which will provide a solution for them It will be short-sighted on our part to fail to acknowledge that they concern us and to do nothing about them Ours is a social as well as a scientific or biological responsibility We have every right to expect the continued freedom of our profession, and as long as we have *it we will continue to accept our* responsibility to set our house in order We have increased our usefulness to the citizens of this great country Each of us, I am sure, realizes that his freedom of action depends upon the continued realization of his responsibilities in the improvement of the health and welfare of his people We have a great heritage We must protect and nourish it

Cybernetics.—Feed back offers a reasonable explanation of certain functions of the nervous system, whose derangement could account for observed symptoms and signs in disease Whether *feed back* pathways are, in fact, so used in the nervous system and to what extent they are a fundamental method of co-ordination and control remains to be established The *study* of the intact nervous system, with all its possible feed back pathways will be *a formidable* undertaking We can, however recognize that the brain is *in the* structure and function of its individual neurones and their synapses wonderfully constructed to act as a complex system including intricate feed back pathways—the miniature circuits permitting a vast complexity in a very small space Retention of information, resembling memory, is a necessary function of the automatic computing machine, *and is secured* by the use of endlessly repeating impulses in closed circuits a dynamic recording process depending on a circus movement Circus movement is no new conception in physiology we can recognize it under certain conditions as an inherent property of cardiac muscle It has been suggested that circus movement *in* closed neurone circuits so-called reverberating circuits may be a basic element of cerebral function perhaps concerned amongst other activities with memory and recollection —Alan Thompson Cybernetics and Animal Integration *Irish Journal of Medical Science*, July, 1951

CHANGING MILITARY MEDICAL PICTURE IN THE UNITED STATES

Richard L Meiling, M D, Columbus, Ohio

The devotion of the American medical profession to the nation's service in time of war as in time of peace parallels the course and history of the republic and is indeed a source of justifiable pride to every member of the profession The military medical services trace their beginning to the first days of the Army at Boston in 1775 Their remarkable development is illustrated when it is remembered that Washington's army throughout the whole seven years of the American Revolution probably did not exceed 5,000 men on the average, while in June, 1950, prior to the Korean conflict, the Army, Navy, and Air Force had more than 6,000 physicians on the active duty roster Today the number of physicians on active duty exceeds 12,000

The daily lives of the majority of the civilians during the revolutionary days were little altered by the military demands It is to be recalled that during World War I America's daily life went on almost as usual with little change in the standard or manner of living The impact of World War II changed not only the standards and manner of living but also the political, economic, and foreign policies of the country The military medical picture has of necessity paralleled the changing foreign and domestic policies of the government The attention of both military and civilian physicians must be focused on certain fundamental problems caused by the changing political thoughts of their fellow citizens and the resulting responsibility which physicians owe their country, their patients, and their profession

Very few members of the medical profession concerned themselves with the changing foreign and domestic policy of the United States from 1945 to 1950 Nor did they watch the foreign policies of other world powers As the fighting ceased in 1945, the hopes of all were high The citizens of the United States—ever optimistic—refused to believe that any reasonable person would plan another bloody struggle just after the conclusion of a war which had cost the belligerents more than 20 million lives and had led to the development of such new destructive weapons as the guided missile, the atomic bomb, and so forth On the strength of these high hopes for the future, the armed forces and the nation demobilized both physically and mentally Everyone hoped for the return to "normal"

In the field of medical science our country embarked upon a heretofore undreamed of expansion in both private and governmental hospitals and medical research programs The armed forces, the Atomic Energy Commission, the Veterans Administration, and the United States Public Health Service through the National Institutes of Health developed a competitive field of endeavor with university and metropolitan hospitals and institutions for trained personnel and facilities in both laboratory and clinical research Graduate medical education originally planned as an advanced educational program providing stability and professional proficiency for both civilian and governmental medical services became a "procurement program" with competition as to salary, rank, and promises of security to be found in "career planning" Patients were sought to maintain clinical and graduate teaching programs Governmental hospitals and medical programs were in some instances providing duplicate services Corrective action was necessary and has been taken

The citizenry of the United States lost sight of the danger signs which were first apparent in 1945 when the "Russian allies" began their now famous "blocking procedures" over the German surrender in Italy, the solution of the Trieste problem, the employment of the Red Cross in Eastern Europe, and the Potsdam conference Perhaps the high ideals expressed in the United Nations' charter, in which the signers declared themselves to be " determined to save succeeding generations from the scourge of war "lulled "John Q Citizen" into false hopes One and all nobly resolved that it should never happen again

In 1947, after almost two years of hearings and debate, congress enacted the National Security Act (often referred to as the Unification Act) This, then, was the cornerstone upon which the total defense of the United States was to be built, it covered not only the military forces but national resources, industry, and manpower as well The civilian and military medical leaders, however, failed to comprehend the significance of this legislation as related to medical and health programs A physician of the character and vision of Dr Franklin H Martin of World War I was needed President Wilson in 1916 appointed him a member of the Advisory Commission of the Council of National Defense, where he provided medical advice at the cabinet level during World War I The wisdom, vision, stature, and patriotism necessary to present sound medical advice and to assure its being heard by our legislative, executive, and military leaders was, unfortunately, not forthcoming in 1946 and 1947

When, in 1947, the hope for a peaceful future began to fade, our nation approved the Truman Doctrine and aid for Greece and Turkey and then started work on the European Recovery Program (Marshall Plan) Widespread confidence, however, in American "know how" prevented the full realization by most people of future dangers The Soviet Union was generally considered incapable for some time of producing either atomic bombs or long-range bombers with which to deliver them

In 1948 the writing on the wall became progessively clearer, but the temper of the time remained unattuned to foresighted precautions The Czechoslovakian *coup d'état,* the Italian electorial struggle, and finally the Berlin blockade all furnished greater evidence of the Soviet Union's intentions As an answer to Soviet actions, congress enacted legislation to assist European nations

---

Former Chairman of the Armed Forces Medical Policy Council Office of the Secretary of Defense

Read before the Section on Miscellaneous Topics Sessions on Military Medicine at the One Hundredth Annual Session of the American Medical Association Atlantic City June 14 1951 in their economic recovery and to start the plans for a North Atlantic Treaty and the military defense assistance program The necessity for an expanded military establishment was not yet recognized Thus, the major problem of the armed forces medical services was to develop coordinated plans and practice the utmost economy in order to obtain the greatest possible efficiency

In the operational field the rapidly changing international situation made increased strength an essential factor Since it could not be obtained by immediate expansion, the armed forces strength had to be gained by efficiency, economy, and management control Thus for two years the Department of Defense searched for ways and means to make each tax dollar give the nation more in combat readiness and striking power with which to meet possible emergencies It was a long, difficult task trespassing on time-honored customs and traditions of the services and misunderstood both purposely and through lack of understanding by many, both in and out of uniform Despite the sudden termination of this program following the invasion of South Korea in June, 1950, it yielded results which have already paid dividends for American forces and will continue to pay dividends in the days to come

Economy, efficiency, and management control are virtues to be sought by the military services regardless of the size of the budget They are necessities in areas of limited national resources, especially in the medical and health services To meet the need for a top level medical coordinating agency, the Secretary of Defense in January, 1948, appointed the Committee on Medical and Hospital Services of the Armed Forces (Hawley Board) composed of the two Surgeons General, the Air Surgeon, and Dr Paul Hawley This group was handicapped from the very beginning by the fact that the members were technical staff officers without authority to act in the name of their services or departments at the Secretary of Defense level The recommendations of this committee were subject to lengthy review on all echelons within the three military departments before they were finally given to the authors themselves, in their roles as Surgeons General in the respective services, for further study and comment on what they had originally recommended This committee was abolished in July, 1949

It was in the summer of 1948 that the Hoover Commission s Task Force on National Security (Eberstadt Committee) reviewed the organization of the national military establishment Shortcomings in the field of medical and health affairs became most evident to this lay and professional group Likewise, a task force studying federal medical services (Voorhees Committee) presented recommendations concerning reorganization of the military medical services The first Secretary of Defense, the late James Forrestal sought the advice of the Eberstadt Task Force and the counsel of several medical leaders He wanted a joint civilian-military medical advisory group to advise the Secretary of Defense on medical and health affairs of the armed forces and so the Armed Forces Medical Advisory Committee was appointed in November, 1948 The chairman Mr Charles P Cooper, was also named deputy to the Secretary of Defense for health matters which position he held until July 6 1949

In May, 1949, the Secretary of Defense established, on the recommendation of the Armed Forces Medical Advisory Committee, the Office of Medical Services headed by a civilian physician with the title of Director of Medical Services The responsibility for medical policy and program development and control was vested in the Director of Medical Services He established an advisory group composed of the three Surgeons General and his immediate staff With the advent of the Korean conflict, the Chief Medical Director of the Veterans Administration and the Surgeon General of the United States Public Health Service were invited to attend all meetings as observers, thus formalizing interagency medical policy discussions on defense matters for the first time

In January, 1951, the importance of medical coordination at the Secretary of Defense level was further recognized by the establishment of the Armed Forces Medical Policy Council The duties of the Armed Forces Medical Advisory Committee and the Office of Medical Services were transferred to this new council

This council, representing our present top level medical policy organization in the Department of Defense, is chairmaned by a civilian physician and is composed of the three Surgeons General and three civilian leaders in the medical and health fields Maj Gen George E Armstrong, M C, U S A, Rear Adm Herbert L Pugh, M C, U S N, Maj Gen Harry G Armstrong, M C, U S A A F, W Randolph Lovelace, II, M D, Isidor S Ravdin, M D, James P Hollers, D D S, and myself, the first chairman [1] The civilian chairman is the assistant to the Secretary of Defense on all medical and health matters, thus facilitating his daily working relations with the military departments, the agencies, boards, councils, and committees of the Department of Defense He is also vested with the authority of direct liaison with outside agencies concerned with medical and health matters There are many of these, such as the Bureau of the Budget, Atomic Energy Commission, United States Public Health Service, National Institute of Health, Veterans Administration, National Security Resources Board, Office of Defense Mobilization, Selective Service, National Research Council, National Science Foundation, American National Red Cross, and also the various professional organizations In medical and health problems, policy control within the Department of Defense has been established and maintained at the level of the Secretary of Defense

Perhaps the most difficult task was to develop an understanding by both professional and lay personnel of the changing world affairs and the urgent need for combat-ready military medical services The public press, radio, and television have presented first hand information on the military medical problems and successes in Korea, at other overseas areas, and here at home The record speaks for itself The military medical services have met the demands of the Korean conflict, the doubling of our military strength in nine short months, and the deployment of troops to overseas areas by bettering even the outstanding medical achievements of World

War II, which were recognized as the acme of medical advancement in the military field

The challenge which confronts the United States today is probably the greatest which has been encountered in the history of the country Dark days were experienced in the Revolutionary War and in the War of 1812, and both sides experienced desperate moments during the Civil War The United States entered the two world wars when the might of the enemy was at its peak On all these occasions, however, the issue was clear-cut, the objective was comparatively simple By mobilizing the full strength of the nation and joining in a common effort, it was evident that those emergencies could be brought to an end, with the job done, the citizen soldiers, sailors, airmen, and civilians could return to their former pursuits and live happily ever after

The present crisis is of an entirely different type The United States is facing the severe test of having to devote the same type of effort and sacrifice to prevent a third world war that in the past was devoted to winning a war This is a novel experience for American citizens They must and can meet this challenge if each recognizes the import, the urgency, and, above all, the need for individual sacrifice, not merely in taxes but in time effort, and thought devoted to the common cause

The foreign and military policies of the United States are united on three basic objectives, which Gen Bradley recently expressed as follows

> 1 We will protect and maintain our form of government and our way of life against any challenge and at any cost 2 We seek peace We will not provoke war We will not wage a preventive war But we will not follow the path of appeasement 3 We seek peace not only for ourselves but for all others We therefore support the United Nations

The Secretary of Defense, Gen Marshall, has stated that the government is now thinking in terms of a possible 10-year tension, a prolonged tension, rather than full-fledged war, during which the strength and resources of the nation can be built to sufficient size to provide adequate national protection

What then does this mean to the medical profession? First and foremost, the armed forces will require approximately 13,000 physicians continually on active duty[2] This is based on the ratio of 3 7 physicians per 1,000 troop strength recommended by the Health Resources Advisory Committee (Rusk Committee) of the Office of Defense Mobilization and concurred in by the Department of Defense Congress, on recommendation of the medical and dental professional associations, enacted Public Law 779[3] (the physician and dentist draft bill) as a temporary "control measure" to assure by legislation the availability of sufficient medical manpower to meet the needs of the armed forces Such manpower control should not be accepted as permanent Some new means to meet this military requirement over a period of 10 years must be developed The merits of the plans currently operating in other democratic countries might be carefully considered In these countries each medical graduate serves his country for a prescribed period of time, both during academic vacation and after completion of his medical training, the same as does each 18- or 19-year-old under Universal Military Service This can be in several small periods or in one single period of time, depending on individual and military needs Such a plan has greater merit than to expand overly the regular military medical services or to interrupt the academic programs of our universities for two full years of training at the age of 18 in order to meet the anticipated military medical requirements With a force of 3½ million men under arms in 1951, in comparison with a force of 185,000 in 1938, many of the coveted traditions of the services must give way to practical considerations in the best interests of the nation as a whole Today no United States military patient is more than 30 to 36 flying hours from the specialized and definitive care hospitals of continental United States It is wasteful of the limited national resources to build, sufficiently staff, or operate duplicating systems of specialized and definitive care hospitals in overseas areas and continental United States as was done in World War II Each military patient overseas requires five able-bodied noncombatants to provide for him Each of these persons requires approximately 0 8 measurement tons of supplies (food, clothing, and so forth) every 30 days Thus, to care for one patient overseas for 30 days requires approximately 4 8 measurement tons of supplies, which must be shipped by air or water to the overseas theater Military commanders recognize these facts and expect medical plans to be developed with full consideration given to reducing to a minimum these requirements

With the rapid movement of patients back to the United States careful screening must be accomplished at overseas areas Some changes in the present accepted surgical and medical treatment methods may be forthcoming to meet the patient needs and professional requirements as air evacuation is utilized to its maximum For example, orthopedic patients might be transported to the United States prior to permanent fixation and the application of traction devices, plastic surgery may be delayed until arrival in the United States, and so forth

As soldiers, sailors, and airmen experience the same excellent medical care and treatment in all hospitals of the armed forces, the resistance to joint utilization of military hospitals of one service or the other will be reduced to a minimum In November, 1950, more than 7,000 military patients were in service hospitals (in the United States) other than those of their own parent service No complaints about medical care or treatment were received from these patients

Military patients who may not be returning to active duty can be transferred without delay to the Veterans Administration hospitals, as directed by the President in January, 1951, thus utilizing the excellent hospital facilities of the Veterans Administration for these service-connected patients and relieving the armed forces of this responsibility The new Veterans Administration hospital system of approximately 130,000 beds is an addition to the governmental medical services since World War II which must be fully considered in all military planning

The United States forces together with members of the armed forces of some 16 nations fighting in Korea have given a preview of the medical and hospital coordination problems of an international military force The development of the North Atlantic Pact Nations' Forces in

[2] Current strength of the armed forces is 3½ million

[3] Further amended and extended by Public Law 51 82d Congress

Europe poses still additional problems in the medical field These problems must be recognized, and their solution should not be attempted on the basis of national prejudices, provincialism, or selfish pride in the medical standards or advancements of individual countries Full recognition of the medical programs, customs, and policies of participating allies is as necessary as recognition of the military proficiency of the participating allied countries and leaders The development of a successful military operation under coordinated command requires the fullest cooperation regardless of the nationality of the commander his staff, or his medical chiefs

Civilian and military physicians of the United States can and must make adjustments to meet the new and changing order in which the citizenry of our country now live The "teamwork" of military and civilian physicians will find further expression in the years to come in the Sessions on Military Medicine of the Scientific Assembly of the American Medical Association It is fitting and just that this forum has been established There is no sharp line of demarcation between military and civilian medicine Physicians in each must understand the problems of the other and give full recognition to the achievements made

Physicians have ever been in the forefront in our nation's service In the years of tension ahead, each physician must keep a clear vision, a sound professional approach to all problems, and place patriotism above self-interest or vested interests Return to the "normal" of the past is an impossibility We physicians are citizens of a nation recognized as the world leader Our duties as citizens of the United States demand that we be as well informed on domestic, economic, military, and foreign affairs as on professional and scientific advancements throughout the medical world

EFFECT OF CORTICOTROPIN (ACTH) IN CHRONIC ULCERATIVE COLITIS

OBSERVATIONS IN FORTY PATIENTS

Joseph B Kirsner, M D
and
Walter L Palmer, M D , Chicago

The remarkable influence of corticotropin (ACTH) and cortisone on the course of certain diseases of obscure pathogenesis[1] has stimulated interest in the effects of the drugs on ulcerative colitis The present paper summarizes our experience with corticotropin in the treatment of 40 patients, and with cortisone in five patients, during the period of January, 1950 to June, 1951 Preliminary observations in smaller groups of cases have been presented elsewhere by us[2] and by others[3] The results to date suggest that corticotropin may be a valuable adjunct in therapy and reverse dramatically the unfavorable progression of the disease Cortisone, in the quantities used appears to be considerably less effective

PATIENTS AND METHOD OF STUDY

The diagnosis of ulcerative colitis was established on the basis of clinical history, proctoscopic and roentgen findings and the meticulous laboratory exclusion of recognized pathogenic agents Most patients had been under prolonged observation and their course prior to corticotropin administration was known The severity of the disease was estimated as mild in six, moderate in 12, and severe or unusually serious in 22 All had undergone extensive and varied medical treatment without sustained improvement A history of allergic disorders—ragweed hayfever, bronchial asthma—was elicited in seven patients, arthritis in seven, rheumatic fever in two, and glomerulonephritis in two One patient previously had undergone resection of small bowel for regional enteritis Ulcerative colitis had been present also in the mother, and in the brother, respectively, of two patients

The effects of corticotropin were determined by carefully controlled clinical studies and by certain objective measurements The general plan of investigation in 28 patients included the following stages (1) an initial control period during treatment with rest, sedation, and bland diet, (2) the intramuscular injection of placebos (saline solution or distilled water) dispensed from corticotropin-labeled bottles and represented to the patients as such, (3) the administration of corticotropin, the transition from placebo to hormone being made without the knowledge of the patient, (4) a post-corticotropin placebo period, and (5) a return to original therapy Placebos were omitted in 12 cases, chiefly because the severity of the illness necessitated early definitive therapy As an additional control, two patients received amphetamine (benzedrine®) sulfate intramuscularly, 20 mg daily, for four and eight days, respectively Three patients received, respectively, (1) lipoadrenal extract (25 cc in five days), (2) adrenal cortical extract (90 cc in eight days), and (3) desoxycorticosterone acetate and ascorbic acid Ascorbic acid alone was given by mouth to five patients in doses ranging from 400 mg to 12 gm daily These medications did not demonstrably improve the course of the disease The rectal mucosa was inspected proctoscopically at intervals of from five to seven

From the Frank Billings Medical Clinic Department of Medicine University of Chicago

This study including the purchase of corticotropin was to a considerable extent made possible by the Leo Wallach Fund for research in ulcerative colitis

Read before the Joint Session of the Section on Pathology and Physiology and the Section on Gastro-Enterology and Proctology at the One Hundredth Annual Session of the American Medical Association Atlantic City June 15 1951

Portions of this study have been presented previously at the 23rd Annual Meeting of the Central Society for Clinical Research Chicago Nov 3 1950 and at the Midwest Regional Meeting American College of Physicians Madison Wis Nov 11 1950 days Roentgen examination of the colon was repeated after treatment in 11 cases

With one exception, all patients were treated in the hospital Both the Armour and Wilson preparations of pituitary adrenocorticotropic hormone were administered[4] The dosage varied, depending on individual requirements and the potency of different lots of corticotropin Usually 25 (Armour) or 20 (Wilson) mg were injected intramuscularly every six hours Larger amounts were administered occasionally, subsequent reductions were determined by the individual clinical response The total intake of corticotropin was less than 1 gm in six patients, between 1 and 2 gm in 18, between 2 and 3 gm in eight, between 3 and 4 gm in three, between 4 and 5 gm in three, and exceeded 5 gm in two patients, the largest quantity given was 7 92 gm during a combined period of 126 days The duration of treatment was less than three weeks in five, between three and four weeks in 12, and between 30 and 126 days in 23 patients

TABLE 1 —*Clinical Response to Corticotropin (ACTH) in Chronic Ulcerative Colitis*

Severity of the Disease	No of Patients	Response During Treatment				Sustained Remissions (35 Patients)
		Good	Moderate	Slight	None	
Mild	6	4	1		1	4
Moderate	12	8	3	1		5
Severe	22	15	3	1	3	6
Totals	40	27	7	2	4	15

Eosinophile Response —The circulating eosinophiles in the peripheral blood were measured every one to three days before, during, and after administration of corticotropin[5] The initial counts were within the normal range in all but five cases A definite, though variable, eosinopenia occurred during corticotropin therapy in 38 patients The initial eosinophile counts served as a practical index of corticotropin effect However, the eosinophile response did not correlate directly with the clinical result, some patients maintained their improvement despite rising eosinophile levels, others manifested little or no clinical response in the presence of significant eosinopenia In 23 patients the eosinophile counts increased as the quantity of corticotropin was lowered In several patients the eosinopenia during repeated courses of treatment was less pronounced than had been observed earlier The "escape" phenomenon may reflect inadequate dosage, adrenal fatigue, or the development of a state refractory to corticotropin

CLINICAL RESPONSE TO CORTICOTROPIN

Placebos —The enthusiastic administration of placebos had no demonstrable beneficial effects In one patient, who was fearful of corticotropin, the injection of placebos represented as corticotropin led to severe exacerbation of the diarrhea, symptoms subsided with the administration of corticotropin The concealed transition from corticotropin to distilled water in several patients promptly resulted in recurrent diarrhea The lack of significant clinical response to placebos was not anticipated and is presumptive evidence against the possible psychotherapeutic effects of corticotropin

Effects of Corticotropin —The clinical response during corticotropin was considered good in 27, moderate in seven, slight in two, and nil in four patients, beneficial effects of varying degree thus occurred in 36 of the 40 patients (Table 1) The remissions were prompt in 24 and gradual in 12 patients Improvement was characterized by the subsidence of abdominal distress and rapid disappearance of the bloody diarrhea The number of stools diminished in 36 patients and the consistency of the bowel movements improved in 34 (Chart 1) One patient enjoyed excellent health during 26 days without a bowel movement Fecal impactions developed in six patients Since bowel activity also may decrease during corticotropin therapy in patients without gastrointestinal disease or with diarrhea of functional origin, the effect is not specific for ulcerative colitis, however, the subsidence of diarrhea during corticotropin therapy in these patients was striking The clinical improvement was no more complete than had been observed previously with other treatment, but it was more rapid and occasionally

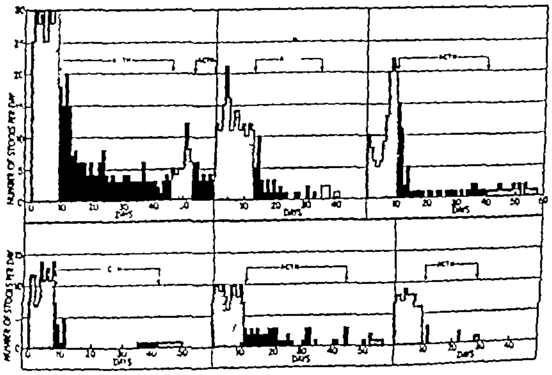

Chart 1 —Corticotropin (ACTH) in ulcerative colitis—disappearance of diarrhea in six patients (G B C. B L. T M S R O and W P) during corticotropin (ACTH) administration Each square shows the course of one patient

dramatic As one patient remarked, "ACTH accomplished in two days what other treatment required six or eight weeks to do " The appetite improved in 36 patients, and daily intakes of 3,500 to 4,500 calories were common, two young men consumed in excess of 8,000 calories per 24 hours The ravenous appetite was in striking contrast to the dietetic problems encountered earlier in these patients A sustained gain in weight was apparent in many instances after the discontinuance of corticotropin

Among the four patients not responding to corticotropin, one had been admitted critically ill and subsequently was found to have had a perforation of the cecum with generalized peritonitis Persistent emotional problems probably retarded clinical progress in three patients, one later underwent a partial colectomy The complications of severe hypokalemia and probable sensitivity to corticotropin necessitated termination of therapy in two of this group The latter case is of considerable interest This patient, a 21-year-old woman with ulcerative colitis, early scleroderma, and rheumatoid arthritis of three years' duration, had improved elsewhere in June, 1950, during the administration of 1,005 mg of corticotropin within approximately three weeks' time Symptoms recurred five days later The present treatment consisted of 1,360 mg of Wilson's corticotropin administered during the period from May 1 to May 10, 1951 The dose had been increased to 200 mg daily on May 6, but there was no significant eosinopenia On May 10 severe angioneurotic edema of the face and extensive urticaria developed These manifestations subsided promptly after the withdrawal of corticotropin and the administration of antihistaminic drugs Subsequent scratch and intradermal tests revealed pronounced dermal sensitivity to both the Wilson and Armour preparations of corticotropin and to corticotropin of sheep origin (Armour) The patient had not known of any allergic tendencies prior to this episode Similar reactions have been noted by Brown and Hollander [6] and others with corticotropin of pork origin, the substitution of beef corticotropin produced no allergic reactions

Emotional conflicts also seemed to interfere with clinical progress in the two patients responding only slightly to corticotropin Symptoms in one case partially subsided during the use of sulfaguanidine The other patient subsequently improved during the daily intravenous administration of 20 mg of corticotropin given over a period of four to eight hours in 500 to 1,000 cc of 5% dextrose in distilled water The eosinophile count decreased significantly after each injection The number of bowel movements diminished from 10 to between two and four daily, and improved in consistency, there was corresponding subjective improvement The possibilities of intravenous corticotropin therapy in ulcerative colitis are being investigated further

Temperature and Pulse —The elevated temperature and pulse rate in 22 patients returned to normal levels within 12 to 18 hours after the initiation of corticotropin therapy In one patient with a large abscess in the buttocks the temperature and pulse remained normal for approximately two weeks but then rose during the continued administration of corticotropin

Emotional Reactions —A sense of well-being developed in 32 patients, in 12 it approached a state of euphoria These emotional upsurges seemed to accompany rather than precede the physical improvement Conversely, the clinical response was not determined by the euphoric state, for many patients improved in its absence However, in a disease such as ulcerative colitis the complex psychogenic and somatic interrelationships cannot be separated clearly One patient remarked, 'The emotional problems, everything, seem to vanish when my bowels are OK " Another commented, "I feel like a normal person again, I have cleaned my desk and am ready for school work " A third patient with very severe colitis stated "ACTH has made me love life, it has taught me that I can be a human being when my bowel is under control Whatever its physical effects, ACTH has had this great emotional impact " This striking response vanished after the withdrawal of the drug

Insomnia and restlessness were noted by 18 patients Emotional disturbances of the type generally associated with ulcerative colitis, though less obvious during corticotropin therapy, remained sufficiently prominent in seven patients as to retard clinical improvement Seven persons appeared more disturbed emotionally during treatment, hypokalemia had developed in three of this group One young man unaccountably committed suicide, though by his own appraisal he had improved considerably, the dose of corticotropin was relatively small and the serum electrolytes were normal Corticotropin may conceal the overt manifestations of emotional conflict, but it does not seem to dissolve the conflict Emotional disturbances usually persist after corticotropin therapy and may precipitate recurrence of the disease

Proctoscopy —Proctoscopy before treatment demonstrated in most instances edema, friability, bleeding, and granularity of the rectal mucosa with bloody fluid and mucopurulent exudate The findings were considered severe in 29 patients, moderate in five, and mild in six Improvement was noted in 34 of the 36 patients reexamined at frequent intervals, the change was pronounced in 20, moderate in nine, and slight in five The earliest evidence of improvement, sometimes occurring within several days, was disappearance of the excess fluid and mucosal edema, the friability and bleeding subsided more gradually, the granularity persisted Three or four weeks usually elapsed before the proctoscopic evidence of improvement was unequivocal

Roentgen Observations —Involvement of the colon was demonstrated roentgenologically in 32 of the 37 patients examined before treatment The entire colon appeared diseased in 21 (including the terminal ileum in two, extensive ulceration in two, and stenosis in one), involvement extended to the hepatic flexure in six and to the splenic flexure only in five patients Eleven patients were reexamined after corticotropin therapy There was no change in eight, the involvement appeared less pronounced in three cases, including one patient in whom extensive ulceration of the left colon disappeared in a spectacular manner Significant roentgen improvement in ulcerative colitis usually is not demonstrable until after prolonged remission of the disease [8], the method, therefore, is not applicable to the study of the relatively early effects of corticotropin

LABORATORY RESPONSE TO CORTICOTROPIN

The sedimentation rate initially was normal in seven, and elevated slightly or moderately in 27 patients During corticotropin therapy the sedimentation rate was unchanged in 10 and decreased to normal in 17, it again rose after treatment in 11 of this latter group The concentration of nonspecific hyaluronidase inhibitor in the blood serum was measured at frequent intervals in two patients [9] The levels tended to decrease during corticotropin therapy, in one patient the pattern of response was similar to that observed in rheumatic fever

Hyperactivity of the parasympathetic nervous system with resultant hypermotility of the bowel has been implicated in the pathogenesis of ulcerative colitis The neurogenic hyperfunction may be accompanied with an increased concentration of acetylcholine and, correspondingly, cholinesterase at the myoneural junctions Whereas serum cholinesterase parallels the state of nutrition, erythrocyte cholinesterase may reflect cholinesterase at the myoneural junctions Measurements in our laboratory, utilizing the Warburg manometric technique, indicated consistently elevated values in active ulcerative colitis and a return to normal levels during improvement with corticotropin [10] (Chart 2)

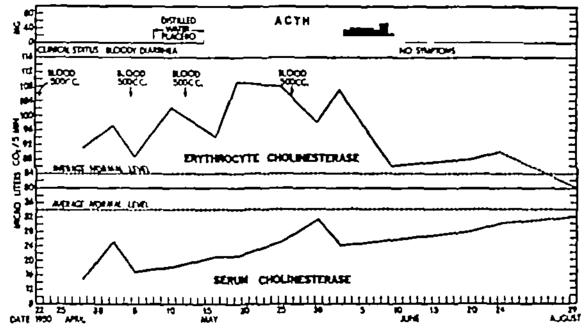

Chart 2 —Return to normal erythrocyte and serum cholinesterase levels during improvement in patient C M M a man aged 22 who had ulcerative colitis for 1¼ years

The daily outputs of feces were measured before, during, and after treatment in 22 patients (18 men and four women) For this purpose, patients deposited all bowel movements directly into weighed glass jars contained in bedside commodes Fecal outputs (grams per 24 hours) were excessive in almost all instances, and did not diminish during the administration of placebos Fecal excretion decreased significantly during corticotropin therapy in 17 patients (Chart 3), the outputs again rose in nine after the discontinuation of treatment Fecal nitrogen was measured continuously in 10 patients As demonstrated previously,[11] the outputs in active ulcerative colitis are much higher than normal, nitrogen excretion in several cases of this series approximated 8 to 11 gm per 24 hours During corticotropin therapy the 24-hour outputs of fecal nitrogen decreased significantly in the 10 patients, although not always to normal levels (Chart 4), the concentration of nitrogen per gram of feces diminished to a lesser extent

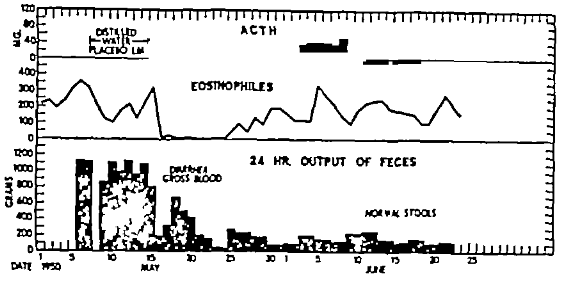

Chart 3 —Prompt and sustained improvement with administration of corticotropin (ACTH) in patient C M M

Lysozyme in the feces was measured in four patients In accord with previous observations,[12] the outputs greatly exceeded the normal range Decreases of varying magnitude were noted during corticotropin therapy Similar trends may be observed during subsidence of the active disease with other therapy, hence, they do not appear specific for corticotropin

Urinary Nitrogen —The profound alterations in protein metabolism during corticotropin therapy are shown in part by an increased urinary excretion of nitrogen

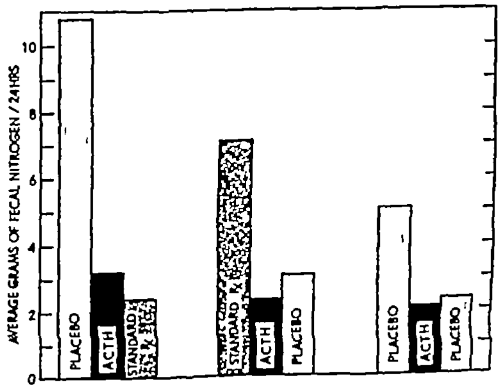

Chart 4 —Decreased output of fecal nitrogen during corticotropin (ACTH) administration in patients C M M H M and L T

The degree of nitrogen loss is determined by several factors, including the responsiveness of the individual to adrenocortical stimulation and his metabolic state at the time of stimulation Urinary nitrogen was measured in 11 patients The daily outputs during corticotropin ranged from 20 to 30 gm , representing two to eight-fold *increases above control levels The excretion* of nitrogen

was in direct proportion to the quantity of protein ingested (Chart 5) Two patients who consumed in excess of 8,000 calories daily, including 54 and 63 gm of nitrogen, excreted the enormous quantities of 42 and 50 gm of nitrogen per 24 hours The nitrogen loss receded rapidly after the withdrawal of corticotropin, original levels usually were regained within several weeks The nitrogen balance in 10 patients, as reflected by measurements of urinary and fecal nitrogen, was negative during corticotropin and positive after therapy was discontinued

Uropepsin—This proteolytic enzyme normally present in human urine probably is derived from the secretion of pepsinogen into the blood stream by the secreting peptic cells of the stomach[13] Spiro and others[14] have demonstrated during the administration of corticotropin and cortisone a pronounced increase in the urinary content of this enzyme The increase presumably reflects the physiological integrity of the gastric glands in response to adrenocortical stimulation or other stress[15] The daily output of uropepsin in the urine was measured in 10 patients of the present series, utilizing a modification of the method described by Mirsky and others[16] The outputs increased two to four-fold during corticotropin and often paralleled the urinary nitrogen (Chart 5) Similar but less pronounced changes were observed in five patients treated with cortisone and in a normal man studied for control purposes

OTHER EFFECTS

Clinical—Edema of varying magnitude developed in 38 patients The use of a low sodium diet decreased the fluid retention but did not prevent it when large quantities of corticotropin were administered The blood pressure rose temporarily in 21 cases Brust and others[17] have concluded that the blood pressure response to corticotropin and cortisone is independent of sodium retention and that the vascular effects of these hormones are mediated by an humoral mechanism Other changes included "mooning" of the face in 22, acne in 23, striae in five, brownish pigmentation of the skin in six (very prominent in one), hypertrichosis in 12, and buffalo-type obesity in five patients One patient spontaneously described the softening of several operative scars A peculiar and unexplained hyperemia of the fingernails developed in five patients and subsided gradually after the withdrawal of corticotropin Eleven patients described a sense of warmth and excessive perspiration, especially during the night, 12 patients complained of increased flatulence and abdominal distention

Creditor and others[18] have reported an inhibition of wound healing during corticotropin therapy A tendency to suppurative complications has been noted by others In the present series, furunculosis of the arm in one patient responded less promptly to penicillin during the administration of corticotropin then after the hormone was discontinued An infected toe in another man healed more slowly than usual An extensive abscess developed in the buttocks of a third, the lesion healed promptly after drainage chemotherapy and the withdrawal of corticotropin Peritonitis secondary to perforation of the cecum was the cause of death in one patient, a tender mass had been palpated in the right lower abdominal quadrant on admission to the hospital and the perforation was thought to have occurred before corticotropin therapy, the rapid progression of the disease was completely unaffected by extensive antibiotic and supportive treatment Pneumonia developed in one patient and rheumatic fever recurred in another after the completion of therapy, both conditions responded to standard management Blood cultures in seven patients were negative

Laboratory—The serum electrolytes (carbon dioxide, pH, chloride, sodium potassium) were measured at intervals of seven to 10 days The serum CO_2 increased in 33 of 38 patients exceeding 40 mM /L in five (normal—20 to 30 mM /L) Hypochloremia developed in 12 patients The serum potassium diminished in seven patients, in two after profuse diuresis induced by mercurial diuretics The hypokalemia was severe in four patients and was accompanied with characteristic electrocardiographic changes, two of this group required potassium chloride intravenously Since potassium chloride by mouth intensified the diarrhea in several patients, this

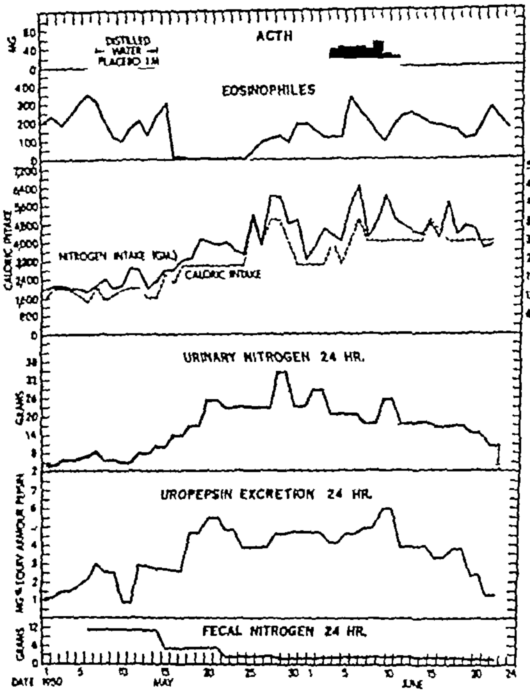

Chart 5—Caloric and nitrogen intake urinary nitrogen and uropepsin and fecal nitrogen during corticotropin (ACTH) administration in patient C M M

medication was not prescribed routinely The disturbances in serum electrolytes subsided gradually when the corticotropin was decreased in dosage or discontinued Greenman and others[19] have suggested the use of a low sodium milk regimen to prevent edema and lessen the changes in electrolytes during corticotropin and cortisone therapy

TABLE 2—*Relapses After Corticotropin (ACTH) Administration*

Pre ACTH Severity		Severity of Relapse		Time Interval	
Severity of the Disease	No of Patients	Milder	Same	Prompt	3 to 6 Mo
Mild	1	1			1
Moderate	7	4	3	4	3
Severe	12	9	3	4	8
Totals	20	14	6	8	12

Transitory hyperglycemia developed in six patients, glycosuria occurred in only two The white blood cell count rose temporarily in 23 patients, approximating 18,000 to 20,000 in seven The erythrocyte count and hemoglobin value frequently decreased The concentration of the total plasma proteins often diminished during corticotropin therapy, the albumin-globulin ratio was normal initially and did not change

WITHDRAWAL SYNDROME

"Withdrawal" symptoms developed within one to three days after corticotropin therapy in 20 patients The syndrome consisted of fever, chilly sensations, malaise, muscular cramps, and decreased appetite, it was mild in seven, moderate in six, and severe in seven patients The serum calcium and phosphorus were normal in several patients Symptoms subsided within several days Although no direct evidence was adduced concerning this point, the syndrome probably is attributable to relative adrenocortical insufficiency and excessive losses of sodium, chloride, and water following withdrawal of corticotropin other chemical aberrations may be involved

FOLLOW-UP OBSERVATIONS

Two patients died, one by a most unexpected and unexplainable suicide while improving, a similar occurrence has been reported after the use of cortisone[20] The other patient (who received a total of 1,675 mg corticotropin in 17 days) succumbed to perforation of the colon and generalized peritonitis, necropsy revealed malnutrition, severe active colitis, perforation of the cecum, and peritonitis, the adrenal glands were enlarged to three times normal size and the cortices contained many hemorrhages

The period of observation in 38 patients after corticotropin therapy has extended up to four months in 13 patients, eight months in 16, and for 12 months or more in nine Treatment has consisted of moderate activity, a bland diet, and sedatives, sulfaguanidine has been prescribed frequently The disease has remained quiescent in 15 patients Symptoms have recurred in 20 patients (Table 2) Relapses were milder than previously in 14 patients, and of their original severity in six The three remaining patients had not responded to corticotropin Sulfaguanidine, 8 0 gm daily, has seemed surprisingly beneficial in 14 of 17 patients so treated for recurrent symptoms The course of the disease after the cessation of corticotropin therapy in the 38 patients, notwithstanding relapses, has been rated as less severe in 27 and unchanged in 11, the majority have resumed a useful life (Table 3)

REPEATED COURSES OF ACTH

Nine patients received more than one course of corticotropin, distributed as follows two courses in six, three courses in two, and eight courses in one In two patients the response remained slight Favorable results were noted in seven, but were temporary in five of this group Increasing beneficial effects were observed in two patients In several cases the eosinopenia became less pronounced with repeated courses in treatment The patient given corticotropin on eight occasions earlier had improved dramatically and was able to leave the hospital after prolonged hospitalization, symptoms subsequently increased but the clinical response to the eighth course of corticotropin was slight despite a definite eosinopenia These observations suggest the development of a refractory clinical state to corticotropin in some patients Gordon[21] and Elkington and others[22] have commented upon this possibility Holbrook[23] has obtained a good clinical response to corticotropin derived from pigs after lack of response to beef corticotropin in patients with rheumatoid arthritis As noted earlier in this report, the intravenous administration of corticotropin may be effective in patients not reacting to intramuscular injections

TABLE 3—*Clinical Course After Corticotropin (ACTH) Administration*

Severe *	20	6	10	4	14	6
Totals	38	13	16	9	27	11

* Two deaths

LONG-ACTING CORTICOTROPIN

Long-acting corticotropin (Armour) was administered in single daily doses to eight patients with recurrent symptoms, the total dose varied from 260 to 2,475 mg The eosinopenia was more variable and transitory and the clinical response was less pronounced than with four daily injections of regular corticotropin The clinical results appeared moderately good in two, slight in three, and nil in three patients Newer long-acting preparations of corticotropin and larger doses may prove more effective

CORTISONE

The effect of cortisone in chronic ulcerative colitis was investigated in five patients The total dosages ranged from 1,900 mg in 10 days to 4,525 mg in 20 days The clinical response was pronounced in one, slight in two, and nil in three instances (one patient received two courses) Symptoms recurred promptly in those patients initially manifesting improvement The eosinophile counts diminished in three cases The proctoscopic changes were slight, the roentgen appearance of the colon was unaltered after treatment in the three patients examined The trends in serum electrolytes, urinary nitrogen, and uropepsin and fecal nitrogen were similar to but less pronounced than with corticotropin therapy The administration of 2,125 mg cortisone in 16 days to a mild diabetic resulted in a pronounced hyperglycemia, persisting for several months There were no other untoward effects One patient with moderately severe colitis improved rapidly during the oral ingestion of 3,000 mg of cortisone in eight days, the eosinophile count decreased slightly, and the urinary nitrogen and uropepsin rose The substitution of a cholesterol solution placebo flavored to resemble the taste of cortisone resulted in the prompt recurrence of symptoms The readministration of cortisone, 1,350 mg by mouth, followed by 1,500 mg intramuscularly, was ineffective Corticotropin, given during the night to conceal the identity of the medication, induced a dramatic disappearance of symptoms (Chart 6) This remission was maintained until the development of a severe upper respiratory infection and recurrent emotional stress Three patients at separate times received both corticotropin and cortisone, corticotropin was vastly superior in inducing remissions Perhaps larger quantities of cortisone will prove more effective

COMMENT

The spontaneous remissions and exacerbations characterizing the natural history of ulcerative colitis necessitate the most careful scrutiny of any new therapy for this puzzling illness Prolonged study of more patients will be required to evaluate conclusively the effects of corticotropin The present observations, nevertheless, suggest that adequate quantities of potent corticotropin preparations may induce striking remissions Many patients had been chronically and seriously ill, in some surgical intervention had been recommended elsewhere The lack of response to conventional therapy in the hospital, the complete ineffectiveness of placebos, and the significant relief of symptoms accompanying the administration of corticotropin would seem to exclude psychotherapeutic effects The improvement was no more complete than had been observed previously in the absence of corticotropin, but it was more rapid and striking The optimum dosage of hormone varied, depending on the severity of the colitis, unexplained individual differences in response to corticotropin, and fluctuations in potency of the drug The administration of moderately large amounts for perhaps six to eight weeks or longer appeared to be more effective than brief courses of treatment The eosinophile counts decreased appreciably in all but one patient, indicating adequate adrenocortical stimulation Impairment of the reserve function of the adrenal cortex has been observed occasionally in chronic ulcerative colitis, probably as a consequence of the long-continued stress [24] The eosinophile count was a useful guide initially in establishing a presumably effective dosage of corticotropin, but the degree of eosinopenia apparently did not determine the clinical result

Subjective manifestations of improvement included subsidence of abdominal discomfort and bloody diarrhea, increased appetite, and a striking sense of well-being, the clinical transformation in some cases was remarkable The emotional response seemed to accompany the improvement in physical condition, rather than precede it, as in the case of McKell and others [25] treated with cortisone, however the two factors undoubtedly influenced each other Objective evidences of remissions such as fewer stools and improved consistency of bowel movements are not specific for ulcerative colitis It has been suggested that corticotropin may suppress colonic hypermotility by inhibiting the formation of acetylcholine [10], studies of the motility of the small and large intestine during corticotropin therapy might be of interest in this connection The proctoscopic manifestations did not correlate chronologically with the clinical response, but subsided usually within three or four weeks The prompt disappearance of mucosal edema and of bloody fluid from the rectum was striking These changes may be related to Ebert's [26] observations that cortisone maintains arteriolar tonus and the integrity of vascular endothelium during experimentally induced infection in the rabbit

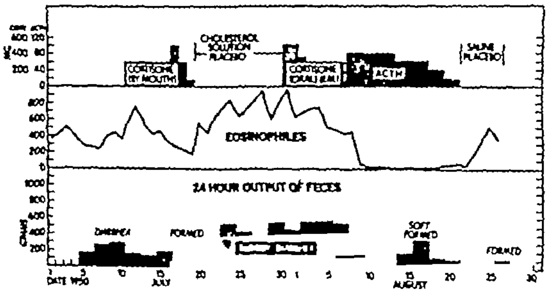

Chart 6—Variable effects of cortisone Prompt clinical improvement with corticotropin (ACTH) administration in patient W K a man aged 33 who had ulcerative colitis for seven years

The laboratory evidences of improvement—decline in sedimentation rate and in the serum concentrations of nonspecific hyaluronidase inhibitor—are observed also in the remissions of rheumatic fever and other diseases The reduction in erythrocyte cholinesterase from high to normal levels similarly may be a nonspecific indicator of clinical remission The decreases in fecal nitrogen and lysozyme likewise accompany the healing of ulcerative colitis during therapy other than corticotropin, hence, they do not constitute specific hormonal effects The fecal outputs of lysozyme reflect the activity of the colitis and thus may be utilized as a measure of clinical response The rapid production of lysozyme by the experimentally injured bowel suggests that it is an early accompaniment of tissue inflammation and necrosis [27]

[26] Ebert, R H In Vivo Observations of the Effects of Cortisone on the Vascular Reaction to Large Doses of Horse Serum Using the Rabbit Ear Chamber Technique to be published

Corticotropin, though of value in inducing remissions, does not cure ulcerative colitis Symptoms returned either promptly or within several months after the discontinuance of therapy in 20 patients With the further passage of time symptoms may recur in all cases initially manifesting improvement The relapses generally were milder than usual and the subsequent course of the disease in many patients, despite recurrences, has seemed less severe than before corticotropin administration Repeated treatment with corticotropin has induced sustained remissions to date in two patients and was helpful temporarily in five Currently available longer-acting corticotropin produced no striking effects On the other hand, the prolonged administration of one or two daily doses of regular corticotropin was beneficial in one patient

The alterations in protein metabolism and the undesirable clinical and chemical reactions encountered during corticotropin therapy in patients with ulcerative colitis are identical with those observed in normal control subjects and in patients with a wide variety of diseases [28] Except for severe hypopotassemia, these side effects did not present serious problems and they subsided without further treatment after the withdrawal of corticotropin On the other hand, the tendency in several patients to delayed healing of suppurative lesions and the occurrence of pneumonia and recurrent rheumatic fever represent potentially serious complications, in a nutritionally depleting disease such as ulcerative colitis the problem assumes added importance The administration of sulfonamides and antibiotics concomitantly with corticotropin may diminish the tendency to suppurative complications Diminution of the excessive loss of nitrogen, perhaps by the use of high potassium diets, [29] also would appear to be highly desirable

The nature of the remissions accompanying corticotropin therapy and the implications contained therein are not obvious at present, specific and nonspecific mechanisms may be involved The recurrences after the discontinuation of corticotropin indicate that the basic cause or causes have not been eliminated There is no evidence that dysfunction of the pituitary or adrenal gland plays an etiologic role in ulcerative colitis The remarkable and varied metabolic, endocrine, chemical, enzymatic, and cytologic effects of corticotropin have not yet been fully elucidated [30] Most of the clinical and laboratory signs of improvement described in this study are observed also during the spontaneous remissions of this disease and other diseases Alterations in enzyme systems, the hypersensitive state, antigen-antibody relationships, tissue permeability, and perhaps in the mechanisms involving hyaluronidase [31] may be postulated but supporting evidence is not yet available The remissions during corticotropin treatment suggest possible identification of ulcerative colitis with the so-called collagen diseases The prompt reversibility of the process would be compatible with the concept of changes in the ground substance of the connective tissue of the rectum and colon, rather than in the formed elements Investigation of this problem now is in progress Preliminary results, indeed, suggest certain similarities between ulcerative colitis and the collagen diseases

The capacity of corticotropin to induce remissions, albeit temporary, and to halt unfavorable progression of the disease stimulates further interest in the pathogenesis of ulcerative colitis and renews hope for its ultimate control

SUMMARY

The effects of corticotropin (ACTH) in chronic ulcerative colitis were studied in 40 patients The disease was classified as mild in six, moderate in 12, and severe in 22 The course was not benefitted demonstrably by placebos of saline solution or distilled water, represented to the patients as corticotropin, or by the administration of other adrenal hormones, amphetamine (benzedrine*) sulfate, and ascorbic acid The clinical response during administration of corticotropin was considered good in 27, moderate in seven, slight in two, and nil in four patients Administration of moderately large quantities of corticotropin for six to eight weeks was more effective than brief periods of treatment Improvement was characterized by the disappearance of abdominal distress and bloody diarrhea, prompt decline in fever, pronounced sense of well-being, better appetite, and by the gradual subsidence of proctoscopic evidences of the disease The eosinophile response did not consistently correlate with the clinical result, but the initial counts served as a practical index of corticotropin's effect. The improvement was no more complete than had been observed previously with other treatment, but it was more prompt and occasionally dramatic

Laboratory evidences of remission included pronounced decrease in the excessive fecal outputs, fecal nitrogen, and lysozyme The sedimentation rate, erythrocyte cholinesterase, and the serum nonspecific hyaluronidase inhibitor tended to diminish from high to normal levels The urinary excretion of nitrogen and uropepsin increased temporarily

The features of Cushing's syndrome, edema, hypertension, characteristic alterations in serum electrolytes, insomnia, flatulence, "withdrawal" symptoms, and other side effects occurred in this series of patients with ulcerative colitis as in other diseases

Among the four patients not benefited by corticotropin, one died of perforation of the colon and peritonitis, probably antedating therapy One patient, after having responded well to corticotropin one year earlier, during a second course of treatment acquired severe angioneurotic edema and urticaria, pronounced dermal sensitivity to pork corticotropin was demonstrated One patient later responded to sulfaguanidine, and the fourth underwent a partial collectomy Among the 36 patients manifesting some degree of improvement during corticotropin therapy, one unaccountably committed suicide The remissions have been sustained to date in 15 patients Symptoms have recurred in 20 Relapses generally have been milder than usual and have responded to diet, sedation, and sulfaguanidine Repeated treatment with corticotropin was helpful in seven patients, but only temporarily in five of this group, in several the eosinopenia and clinical response were less pronounced than had been observed earlier Currently available long-acting corticotropin did not produce striking results In general, the course of the disease, notwithstanding recurrences, has seemed less severe in 27 patients In five patients with chronic ulcerative colitis cortisone appeared to be considerably less effective than corticotropin

CONCLUSIONS

1 Corticotropin (ACTH) does not cure ulcerative colitis but frequently induces striking remission of the disease

2 Similar clinical improvement may occur without corticotropin but usually is less rapid

3 Relapses are frequent, but thus far they seem less severe

4 The mechanism of the induced remissions is not yet known

DEGENERATIVE JOINT DISEASE OF THE HIP

RELIEF OF SYMPTOMS FOLLOWING CORTISONE THERAPY

Ralph H Boots, M D , L C Yen, M D , K J McMorrow, M D
and
Charles Ragan, M D , New York

Degenerative joint disease is a manifestation of aging, the result of the wear and tear of living on articular structures Pathologically there is a change in the articular cartilage leading to fibrillation of the cartilage followed by eburnation of bone and overproduction of bone exostoses When the damaged joint is in an abnormal position, acute symptoms may result from acute or sustained trauma following normal structural stress and strain, and during the acute phase an inflammation of the synovia is usually seen In all instances, there is a certain element of overproduction of connective tissue manifested by granulation tissue in the form of pannus Since we have felt that hyperadrenalism induced by corticotropin (ACTH) or cortisone may interfere with inflammatory reactions in the connective tissue and delay the turnover of granulations,[1] it was decided to evaluate the effect of cortisone on degenerative joint disease Many forms of this disease are available for study, but, in most instances, the course of these articular lesions is variable and is influenced by many nonspecific factors However, in one instance of degenerative joint disease—malum coxae senilis (degenerative joint disease of the hip)—the course is progressive and symptoms are usually sustained and are not modified by simple palliative measures For these reasons we have treated a group of patients suffering from malum coxae senilis with cortisone acetate obtaining what we consider to be favorable results comparable in degree to that reported in rheumatoid arthritis [3] In a group of patients past middle age, the dangers of administering cortisone such as thromboembolic phenomena and salt and water retention with congestive failure, were fully realized On the other hand, all of these patients were miserable with hip pain and considering surgery for relief The risk of cortisone did not seem any greater than that of surgery

Eleven patients, five men and six women, were treated Their ages varied from 54 to 82 years In four patients the right hip only was involved, in three patients the left only, and in four patients there was an involvement of both hips The treatment schedule followed was 100 mg of cortisone every eight hours for the first 24 hours, and, following this, 100 mg daily for a period of five to 17 days In most of the patients, very little subjective improvement was noticed during the first four days of administration of the drug Marked subjective improvement occurred by the seventh day in 10 of the 11 patients They were then discharged from the hospital and continued with doses varying from 50 to 100 mg , three times a week The patients were not confined to bed, and they were encouraged to go through as much of their daily activities as compatible with confinement in a hospital and were given supervised resistive exercises to the affected joints daily The dosage and clinical improvement are shown in the Table In seven patients the range of motion of the involved joints was measured by one of us before the beginning of their treatment, and again before they left the hospital In these seven there was an increase in range of motion of the affected joints In

[3] Hench P S Kendall E. C. Slocumb C H and Polley H F Effect of a Hormone of the Adrenal Cortex (17-hydroxy 11-dehydrocorticosterone Compound E) and of Pituitary Adrenocorticotropic Hormone on Rheumatoid Arthritis. Preliminary Report Proc Staff Meet. Mayo Clin 24 181 1949

most instances increase in range of motion took place only after pain on activity was reduced

This group of elderly people tolerated cortisone in the amounts given as well as the average patient Insomnia was a disagreeable feature in three of the 11 In two of them it occurred during the first few days of treatment only In the third the insomnia was so marked that the hormone was discontinued after two weeks In two patients a transient glycosuria developed, and one patient seemed somewhat hyperactive during the initial phase of hormone treatment and a peculiar twitching of the mouth developed These deviations from the normal disappeared while on the lowered maintenance dosage The one patient who did not have an excellent result was a man aged 56 who had involvement of both hips probably secondary to osteitis pubis subsequent to prostatectomy Although an increase in the range of motion of the hips was noted, there was no change in the pain or stiffness, and we considered that he had gained insufficient improvement to warrant a continuing dosage

Dosage and Clinical Improvements of Patients

Patient	Age and Sex	Hip Joint Involved	Duration of Symptoms	Initial Course of Cortisone	Untoward Symptoms	Subjective Improvement (Pain and Stiffness) Following Initial Treatment	Continuing Dosage Used Mg	Remarks
E S	61-F	Left	3 yr	850 mg 7 days	None	Marked	75 (3 times a week)	Subjective relief marked
E G	72-F	Left	14 mo	1 000 mg 12 days	None	Marked	100 (2 times a week)	
J G	75-M	Right	5 mo	800 mg 8 days	Insomnia	Marked	50 (daily) 100 (2 times a week)	(Discontinued because of insomnia)
M M	70-F	Right	10 yr	1 200 mg 9 days	Moderate insomnia—4 nights	Marked	100 (3 times a week) (oral)	
J O	56-M	Both	3 yr	1 100 mg 8 days	None	No change	Insufficient improvement to warrant continuing dosage	
K S	82-F	Right	20 yr	1 100 mg 9 days	Hyperactive—2 weeks	Marked	50 (3 times a week)	
C H	55-M	Both	8 yr	1 100 mg 8 days	Glycosuria—2 days	Marked	500 (weekly)	Cortisone stopped after 8 days two weeks later slipped back 50% and cortisone again given with relief
E H	69-F	Right	10 yr	875 mg 8 days	Glycosuria—2 days	Marked	75 (3 time a week)	Cortisone stopped because of intermittent enteritis
J I	68-M	Both	10 yr	1 000 mg 10 days	Mild insomnia	Marked		No maintenance relapsed after 3 wk
A B	54-F	Both	8 yr	1 000 mg 8 days	Insomnia	Marked	100 (3 times a week)	Kept only in fair remission
R L	73-M	Right	5 yr	700 mg [illegible] days	None	Marked	375 (weekly)	Maintained 50% improvement, increase in abduction maintained

We have been able to follow eight of the 11 patients for nine months Two were lost to follow-up and one received no benefit Five of the eight patients continue to receive cortisone, the dosage varying from 50 to 75 mg daily by mouth The hormone was discontinued in two patients because of the appearance of congestive failure manifested by peripheral edema The third discontinued the hormone in the second month of therapy during an episode of abdominal pain and diarrhea Partial improvement has been maintained in this patient.

COMMENT

As in all instances of degenerative joint disease, when the joint has been injured or exposed to excessive trauma, the changes associated with wear and tear appear at an earlier age One of the patients (C H) is believed to have had Legg-Perthes disease (osteochondrosis of capital epiphysis) of both hips as a child, since he was placed on bed rest with the later use of braces in his first decade of life, but details of this illness are not available

The pathway by which the pain and limitation of motion in degenerative joint disease are beneficially modified by the induction of minimal hyperadrenalism is not clear We have supposed that the amelioration of symptoms following this procedure in rheumatoid arthritis might be related to a decreased reactivity of the connective tissue [1] This hypothesis has been based on studies done in animals and man, whereby the repair of traumatized (surgical wound) connective tissue progressed more slowly when hyperadrenalism was induced The decrease in rate of repair could be correlated with the amount of hyperadrenalism induced With marked hyperadrenalism, repair processes for a time were brought to a complete standstill With minimal degrees of hyperadrenalism, repair took place almost normally, and delay, if present at all, required careful rebiopsy techniques in order to be demonstrated Histologically, once fibroblasts have been laid down, healing with deposition of ground substance and growth of blood vessels has progressed at the usual rate We therefore have suggested that the inhibition of connective tissue growth during hyperadrenalism rests at the prefibroblast level Although the actual demonstration of maturation from stem cell (or histiocyte) to fibroblast has not been clearly defined, it is agreed by most that the precursor of the fibroblast is this particular cell called by many names, such as stem cell, histiocyte, macrophage, or clasmatocyte This cell presumably is a member of the reticuloendothelial system, and it is apparent that one of the major cellular effects of induced hyperadrenalism is a depression of the reactivity of this system Thus, to our original concept that during the hyperadrenal state the reactivity of the connective tissue was depressed, a corollary may be added that this depression is related to or caused by a depression of the reticuloendothelial system, one component of which acts as the precursor of the connective tissue system in repair as well as in its dynamic turnover

With this concept in mind, some insight into the mechanism involved in the amelioration of the symptoms of degenerative joint disease by cortisone administration may be proposed In degenerative joint disease, there is an element of proliferating connective tissue manifested by the presence of granulations From the above discussion, it is apparent that these granulations will not be modified during the hyperadrenal state save over a long period, since the life span of the mature connective tissue cell apparently is quite prolonged The patients described noted improvement promptly, which would imply that the effect is at the macrophage level

There has been much speculation concerning the "anesthetic effects" of cortisone and corticotropin This has not been substantiated by controlled experiments on pain induced by several different stimuli[4] There is a possibility that the observed effect in these patients was related to the euphoria, or increase in sense of well-being, but by and large this group of patients showed no obvious trend in this direction

The widespread effects of cortisone and corticotropin described in recent years involving many systems such as the central nervous system,[5] antibody production,[6] antipyresis,[7] poor localization of inflammation,[8] make it seem unlikely that this effect on degenerative joint disease is purely one of anesthesia or of one comparable to topectomy, whereby pain is noted but is of no concern to the patient

SUMMARY AND CONCLUSIONS

Eleven patients with degenerative joint disease of the hip were treated with cortisone, with marked subjective improvement resulting in 10 patients An increase in range of motion of the hip, to a greater or lesser degree, occurred in all patients in which this was carefully evaluated

Very few untoward symptoms were seen initially in this group of patients despite the fact that they were of the older age group In general, the dosage required to obtain improvement is comparable to the amount needed for a patient with mild rheumatoid arthritis

However, prolonged continuous hormonal administration was not practical in all cases Cortisone was discontinued in five of 10 patients noting beneficial effects for various reasons Thus, after nine months, only five of the original 11 patients continue to receive the hormone

We fully realize the small number of cases studied, but submit this as a preliminary report

CORTISONE IN THE TREATMENT OF OSTEOARTHRITIS OF THE HIPS

Charles Y Brown, M D , Ralph A Jessar, M D
and
Joseph Lee Hollander, M D , Philadelphia

Although the literature on cortisone in the therapy of various diseases has become voluminous little has been said concerning its use in degenerative joint disease (osteoarthritis) This is particularly true with regard to degenerative joint disease of the hips, so-called malum coxae senilis There have been several encouraging reports on the efficacy of corticotrophin (ACTH) or cortisone in other forms of degenerative joint disease

Hench and others[1] reported a patient with degenerative joint disease of the left knee, who received cortisone for the treatment of leukemia cutis The pain and stiffness in the knee was ameliorated and remained improved when the patient last was seen a month later Thorn and others described marked alleviation of symptoms in a patient who had generalized degenerative joint disease with involvement of both hips Therapy in this case consisted of 40 mg of corticotrophin daily in divided dose for seven days Dale[3] described dramatic improvement in two cases with this drug but, from the data supplied, it is not absolutely clear that the latter were cases of pure degenerative joint disease

In a recent talk, Boots described beneficial effects in 10 of 11 patients with osteoarthritis of the hips on cortisone therapy Our previous experience with three similarly afflicted patients receiving cortisone was not in accord with the above We decided, therefore, to investigate a larger series The results are the basis of this paper in which eight patients with osteoarthritis of the hips who were treated with cortisone acetate are discussed The doses of cortisone used for all patients were deemed sufficient to have controlled even a severe rheumatoid process

The eight patients selected were chosen on the basis of their reliability as witnesses Although each was aware that she was receiving cortisone the drug was adminis-

This inv[illegible] was sup[illegible] by [illegible] Institutes of H[illegible] United States Public [illegible] tered in a noncommittal manner Leading questions were avoided as much as possible in evaluating the subjective response

In Table 1 are summarized some of the salient facts about each of the eight patients It will be noted that seven are female and one male Cases 1, 2, 4, and 8 will be discussed in more detail

Fig 1 —X ray showing marked narrowing of the joint space in both hips and sclerosis of the femoral heads and acetabula

REPORT OF CASES

Case 1 —B B was a 58-yr-old white woman whose chief complaint was severe pain in both hips when walking This had been increasing for eight years and had progressed to such an extent that ambulation even with two canes was painful and slow Pain and stiffness of lesser degree were present in the knees and lower spine Acetylsalicylic acid (aspirin) in doses of 40 to 60 grains (2 6 gm) daily was required for temporary relief

This florid, obese woman weighed 174 lb (78 9 kg) There was marked increase in lumbar lordosis Abduction and external rotation of the hips were moderately restricted by muscle spasm X-ray studies showed marked narrowing of the joint space in both hips, with sclerosis of the femoral heads and acetabula (Fig 1) There were also advanced hypertrophic changes in the lumbar part of the spine and marked narrowing of several intervertebral spaces The blood cell count, Kline and Kolmer tests, urinalysis, and albumin globulin ratio were normal The sedimentation rate was 36 mm in one hour (Wintrobe) The reason for the elevation of the sedimentation rate was not apparent

A lumbrosacral support was fitted with considerable relief from back pain and the canes were replaced by crutches for walking Concomitantly 1 5 gm of cortisone acetate was given by injection during a 15 day period, along with daily treatment in a Hubbard hydrotherapy tank The initial dose was 300 mg which was then reduced to 200 and 100 mg, and finally to 75 mg, per day There were no detectable side effects and indeed the patient lost 8 lb (3 6 kg) in weight on a 1,200-calorie low salt diet

There was no subjective or objective evidence of improvement as determined by the amount of pain on walking and the range of motion in the hips The pain in the knees was lessened, but certainly not more than was anticipated for any hospitalized patient The lumbrosacral pain had abated even before cortisone therapy was instituted The sedimentation rate remained unchanged at 36 mm in one hour (Wintrobe)

Case 2 —M H was a 71 yr old white woman who had experienced increasing pain in her hips for the past seven years This pain had become so severe that she had been obliged to use first canes, then crutches, in order to walk

The patient weighed 144 lb (65 3 kg) The hips were moderately limited in all movements by pain and spasm There were several symptomatic Heberden s nodes on the terminal interphalangeal joints on both hands, and the knees showed some lateral instability X rays of the hips (Fig 2) disclosed marked degenerative changes with joint narrowing and bone sclerosis The entire spine and both knees showed advanced hypertrophic changes, and there was degeneration of many intervertebral disks The blood count, Kline and Kolmer tests, urinalysis and albumin globulin ratios were within normal limits, and the sedimentation rate was 26 mm in one hour (Wintrobe)

Table 1 —*Salient Facts About Patients*

	Sex	Age	Duration of Symptoms Yr	Aids in Walking	Involvement Demonstrated by X Rays
1 B B	F	68	8	2 canes	Marked
2. M H	F	71	7	Crutches	Moderately severe
3 E L	F	60	10	0	Moderate
4 E S	F	20	3	0	Moderate
5 E B	F	08	4	0	Moderate
6 J W	F	65	15	Cane	Marked
7 G L	M	47	½	0	Moderate
8 G H	F	78	3	0	Moderate

Hinged knee braces were prescribed for the knees, and Hubbard tank therapy was given daily for nine days Cortisone acetate was given by injection for 10 days in the doses described previously in Case 1 Side effects again were absent, and the sedimentation rate fell to 9 mm in one hour during this period However, there was no subjective or objective evidence of improvement in the hips Pain and spasm persisted, and the range of motion was not appreciably altered

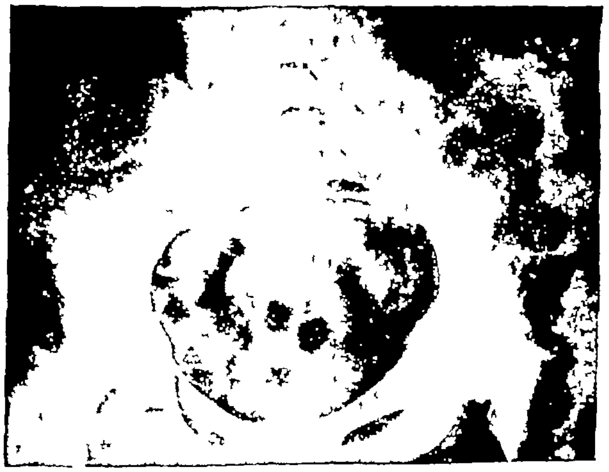

Fig 2 —X ray showing degenerative changes, narrowing of the joints and bone sclerosis

Case 4 —E S was a 26 yr old woman who had coxa plana since childhood Degenerative changes in the hips ensued gradually and became symptomatic during the past three years Walking was so painful that she was unable to do the shopping or much of the routine housework It was the opinion of the orthopedic surgeons that hip arthroplasties were indicated, but they were willing to allow a trial on cortisone first

4 Boots R H and Ragan C *Degenerative Joint Disease of the Hip* (Malum Coxae Senilis Osteo-Arthritis of the Hip) Relief of Symptoms Following Cortison Therapy read before the Meeting of the New York Rheumatism Association New York City April 11 1951

Cortisone by mouth was started on an outpatient basis in the usual dosage After seven days there was evidence of considerable subjective benefit but no objective change By the second week the patient was able to do all of her housework and to go shopping as before The subjective improvement was marked, and this woman was the only patient who became noticeably euphoric There was also evidence of objective improvement in that the intermalleolar distance on forced abduction had increased from 41 5 to 47 5 cm Placebo tablets were substituted for one week, and the patient experienced a moderate subjective relapse The patient resumed treatment with cortisone and was still deriving considerable benefit after seven weeks

Case 8 —G H was a 78 yr-old woman who had suffered from unilateral hip disease for three years Although she had pain and limped when walking, she did not require a cane or crutches

The blood count and sedimentation rate revealed no abnormality X rays disclosed a normal left hip but a moderately narrowed and sclerotic right hip joint Cortisone was administered orally in an initial daily dose of 150 mg for two days, then 100 mg. daily for 15 days This treatment was also carried out on an outpatient basis

After 10 days the patient stated that she had considerably less pain, although she maintained a limping gait Improvement was more marked, however in the objective appraisal The intermalleolar distance had increased from 23 in (58 4 cm) to 29 in (73 6 cm) flexion had increased by 30% and extension by 20% There was no change in the degree of abduction or rotation There was no doubt that this patient was improved during the trial on cortisone so the treatment was continued Throughout the next seven weeks there seemed to occur a slow relapse, even though the dose of cortisone was maintained at 75 100 mg daily The patient still continued on cortisone at the time of this writing, but was becoming increasingly discouraged, feeling that she was only a little better than before taking the drug The increased abduction noted on cortisone trial has also decreased to almost pretreatment amount.

The results in all cases are summarized in Table 2

In only two of the eight cases was there evidence of any degree of improvement as judged by the patients' subjective evaluation and by objective measurement of hip motion Only in Case 4 did euphoria occur Indeed, several patients requested that the treatment be discontinued In only two instances, Cases 4 and 8, was it mutually desirable to continue with cortisone therapy

COMMENT

Although degenerative joint disease is sometimes regarded as a natural, aging process which is comparatively benign, a study of patients with malum coxae senilis reveals the marked incapacitation that may result The pain it produces accompanies every move and may be only less intense at rest Treatment of this condition has been aided by such means as braces crutches, intra-articular injections, neurectomies and arthroplasties Until the etiology is better understood, little more than palliation can be offered

It seemed, therefore, that a trial of cortisone might be indicated in osteoarthritis of the hip even without a specific rationale, for the mode of action of cortisone in arthritis is still undetermined Physiologically, there was little reason to believe that this hormone would be of value in degenerative joint disease We had noted its ineffectiveness in several cases in which there was degenerative joint disease which was superimposed on a burned out' rheumatoid process Despite this, we were prompted to give cortisone a trial because of several observations It has been shown that there is probably a decreased synovial blood flow in degenerative disease as determined by intra-articular temperature cooling curves[5] It has also been shown that cortisone will increase the peripheral blood flow[6] Therefore, if some of the pain and muscle spasm in this disease is caused by synovial ischemia, it is conceivable that cortisone could be of benefit by improving synovial circulation

Although cortisone had no appreciable beneficial effect in the dosage used on either the degree of pain or the range of motion in six of the eight patients, it is barely possible that larger doses of the drug over a more extended period might have effected improvement in the refractory cases Whereas a trial with corticotrophin might also have succeeded where cortisone had failed, in one additional case of unilateral osteoarthritis of the hip, not included in the above series, a two-week-trial with corticotrophin had produced apparent subjective, but no objective, benefit. Salicylates and amphetamine sulfate were later administered, beginning six weeks after administration of corticotrophin had been discontinued, and it was found that the subjective benefit from this was greater than it had been while the patient was on corticotrophin This finding emphasizes the fact that further study is required, in which controls are used

* Treatment continued

SUMMARY

Eight patients with osteoarthritis of the hips (malum coxae senilis), who were treated with cortisone acetate are discussed There was no evidence of subjective or objective benefit that could be attributed to cortisone in six of the cases The improvement noted in two cases was sufficiently marked to justify continuation of the treatment It is difficult to justify the use of cortisone in the treatment of osteoarthritis with the known limitations and dangers of such treatment in this older age group on the basis of our results

PROLAPSE OF THE GASTRIC MUCOSA INTO THE DUODENUM

I W Kaplan, M D , New Orleans
and
R M Shepard, M D , Tulsa, Okla

Prolapse of the gastric mucosa into the duodenum, as the name implies, is the protrusion of the redundant gastric mucosa through the pylorus into the duodenum It is not rare in occurrence, and it may be responsible for a number of undiagnosed gastrointestinal symptoms

Since the first reported case of prolapse of the gastric mucosa was surgically proved by Schmieden,[1] in 1911, over 100 cases have been reported as observed on x-ray but not confirmed by surgery

Feldman [2] indicates that redundant gastric mucosa occurs in approximately 1% of all patients with gastrointestinal disease Scott,[3] reviewing 1,346 cases of upper gastrointestinal tract disease, found 14, or 1 04% Rees [4] found 4 cases of the condition in 3,000 patients who had upper gastrointestinal x-ray studies Cove and Curphey [5] reviewed 650 cases and found that prolapse had occurred in 22, or 3 38% It was their impression that the incidence is greater than is usually suspected Eliason, Pendergass, and Wright [6] were the first to describe the roentgenographic signs produced by prolapse of gastric mucosa, in 1926 Melamed [7] collected 25 diagnosed cases in which the patients were relieved of symptoms after medical or surgical care Ferguson,[8] in a review of 297 examinations of the upper part of the gastrointestinal tract made at Grady and Emory University hospital, found 23 cases, an incidence of 7 7% He reports summaries of six cases, only one of which was proved by surgery DiLeo, Kuker, and Shepard,[9] in 1949, summarized the literature of 33 cases proved by surgery and added one of their own

The purpose of this report is to review briefly the literature on this condition, to emphasize its clinical aspects, and to report four cases that came to our attention in the past two years on the surgical services at Charity hospital and Touro infirmary in New Orleans

An analysis of the literature discloses that a total of 41 cases of prolapsed gastric mucosa were proved at operation [10] We have added four more cases, one of which has been previously reported This brings the total to 44 (table 1) Over 100 cases were reported on x-ray, and the number may be even greater by this time However, they were not confirmed by surgery, and therefore, are not included in this report

ETIOLOGY

The etiology of this condition and the mechanism of its occurrence are not definitely known Several theories have been advanced Eliason, Pendergass, and Wright [6] feel that a low-grade inflammation of the antral mucosa causes a hypertrophy of the mucosa and that the added effect of hyperperistalsis pushes the gastric mucosa through the pylorus Rees [4] suggested that a degeneration of the pyloric muscle occurred and that if hyperperistalsis developed this caused the antral mucosa to become loosened and forced through the pylorus Bralow and Melamed [11] theorized that a hypertrophic gastritis developed secondarily to a benign peptic ulcer, on either the gastric or the duodenal side, and in a small number of cases would eventually cause a prolapse of the mucosa through the pylorus Scott's [3] observations led him to believe that a preexisting disease process of the gastric mucosa is not necessary for the production of a prolapse He believes that the development of a prolapsed mucosa is inherent in the walls of the normal stomach and that any condition that may produce hyperperistalsis, whether neurogenic, such as fear, anxiety, or anger, or chemical, caused by stimulants such as coffee, tobacco, alcohol, or condiments, may play a part in the production of this condition Cove and Curphey [5] offer no new theory but conclude that the lesion is a mechanical one based on a hypermotility of the gastric mucosa This hypermotility may be congenital or caused by conditions that produce abnormal gastric motility which, over a period of time, loosens the mucosa from the submucosa to such an extent that a prolapse could occur From observation of four patients in the ward and at operation, we are inclined to agree with the conclusions of Cove and Curphey [5]

PATHOLOGY

On operation [11] the prolapsed portion of the gastric mucosa appears like a loose collar of redundant hypertrophied mucosa The prolapsed fold may have the appearance of normal mucosa, soft, pliable, and not fixed, or it may be thickened, as in chronic gastritis Studies of the normal gastric antrum reveal that the mucosa and the muscularis are connected by soft, yielding submucosa composed of loose, areolar tissue containing blood vessels, lymphatics, and nerves Scott,[3] in studying over 100 autopsy specimens, demonstrated that the mucosa is movable over a distance of 1 to 1½ in (2 5 to 3 8 cm) However, this amount of mobility was not enough to permit a prolapse Melamed demonstrated that the movement of the gastric mucosa on the submucosa varied in individuals, and in some the gastric mucosa could be

pulled through the pyloric ring Studies of associated disturbed physiology of the stomach, as determined by gastric acidity, failed to show any correlation Gastric acidity from zero degrees free and 13 degrees total to 75 degrees free and 90 degrees total was reported Gastric motility, as demonstrated under fluoroscopy with a barium meal, also varied with the degree of pyloric obstruction present.

INCIDENCE

Prolapse of the gastric mucosa is found more commonly in the older age group, the majority of cases occurring in the fourth and fifth decades There is a predilection for the male sex There were 28 males and 16 females in the collected series, a ratio of approximately 1 8 to 1 The incidence does not vary according to race

SYMPTOMS

The clinical picture of prolapsed gastric mucosa is so variable that a definite diagnosis cannot be made from symptoms alone The history of symptoms ranges from several weeks to 10 or more years and from mild to severe (table 3) The more frequent complaints are those of epigastric distress, nausea, and vomiting aggravated by the taking of solid food This was present in two of our cases In cases of severe prolapses nausea and vomiting probably indicate a more complete pyloric obstruction In the collected series of cases more commonly noted were epigastric pain of varying intensity (61 5%), digestive symptoms, such as indigestion, nausea, and loss of appetite (36 4%), vomiting (15 9%), epigastric fulness (13 6%), gastrointestinal bleeding as revealed by hematemesis and melena, or persistent occult blood in the stool (40 9%) (table 4) We believe the latter finding to be significant and feel that every case of unexplained gastrointestinal bleeding should be investigated from the standpoint of a possible prolapse The symptoms are not specific and may be imitated by a variety of upper abdominal diseases They are produced by a partial block of the pylorus by the redundant prolapsed mucosa that is intermittently pushed through the pyloric ring Trauma to the mucosa can cause superficial erosions which might cause bleeding

PHYSICAL FINDINGS

The physical findings in most cases are entirely noncontributory Cove and Curphey were able to feel a soft, doughy mass in the epigastrium in two of their five cases We were unable to feel a mass in any of our four cases, though the patients were examined by a number of physicians at various times Localized tenderness was found in some of the other cases of the collected series, and some showed evidence of weight loss or anemia

LABORATORY DATA

The laboratory findings sometimes demonstrated a mild or moderately severe anemia The gastric analysis usually shows a normal acidity Scott[5] reported that in two-thirds of the cases the values were within normal limits or below and in one-third there was hyperacidity Persistent occult blood in the stool is found in approximately 40 9%

X-RAY DATA

X-ray is the most valuable aid in establishing a correct diagnosis A central filling defect near the base of the bulb, giving a mushroomlike appearance is the characteristic picture Often the gastric rugae can be traced into the defect (Apr 10, 1914) (figs 1, 3, and 4) The prolapse has been more readily demonstrated in the prone than in the erect position Retention is not necessary for the roentgenological diagnosis, and hyperperistalsis is not a constant finding Teitelbaum[12] cites a case which he saw on fluoroscopy and reduced the prolapsed mucosa back through the pyloric ring The prolapse, however, is not always seen on fluoroscopy, and films should always be made Since the mucosal prolapse is often intermittent, it may be necessary to take repeated x-rays before a definite diagnosis can be made In a case reported by Moon and Speed[10r] the first two gastrointestinal series disclosed normal conditions but the third examination revealed a prolapsed gastric mucosa Cove and Curphey[5] had a similar experience in one of their cases In three of our four cases a diagnosis was made by x-ray In reviewing the x-rays made on the fourth case, the roentgenologist found them suggestive and felt that if he had kept this condition in mind he probably would have made the correct diagnosis In this case the filling defect was interpreted as a probable carcinoma of the stomach In the collected cases a pattern characteristic of a mucosal prolapse was observed on x-ray in 28 cases

The condition must be differentiated from pyloric ulcer, hypertrophic gastritis, prolapsing gastric polyps, duodenal polyps, and carcinoma of the stomach A definite diagnosis can be made only by exploratory laparotomy and gastrotomy

TREATMENT

All the patients with a prolapsed gastric mucosa should have a trial of medical management which should include a bland, soft diet and antispasmodic drugs If they fail to respond to treatment in a month, an exploratory laparotomy is indicated Several types of operations have been suggested and performed These include excision of the redundant mucosa and pyloroplasty, gastric resection, gastroenterostomy, simple excision of redundant mucosa, excision of the mucosa and gastroenterostomy, pyloroplasty, and closure of the pylorus and gastroenterostomy Of our four patients, one had a Heineke-Mikulicz pyloroplasty with a good result Two had an excision of redundant mucosa and a Heineke-Mikulicz pyloroplasty One had an excellent result, and the other, age 81 died of other causes seven days after the operation The fourth

had simple excision of the redundant mucosa In this patient an obstruction developed at the pylorus, necessitating reoperation We found a circular stricture at the pyloris Because of very dense adhesions about the pylorus, a gastroenterostomy was performed Four months later the patient was asymptomatic

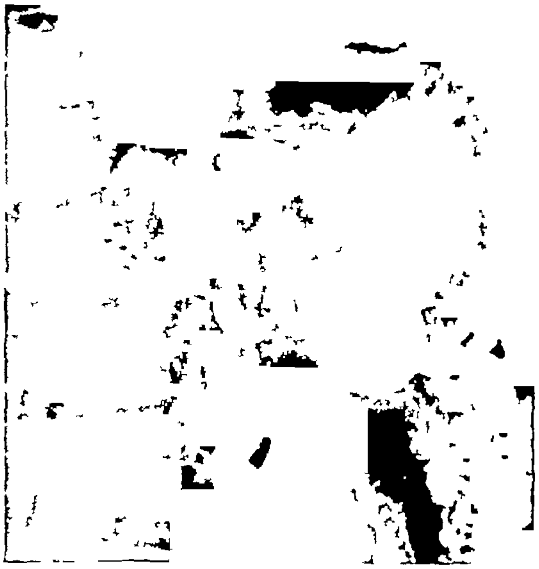

Fig 1 (case 1)—Preoperative gastrointestinal series showing typical mushroomlike appearance characteristic of prolapse of gastric mucosa into duodenum

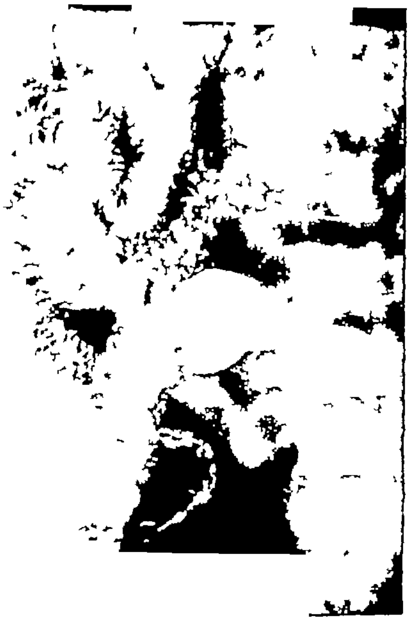

Fig. 2 (case 2)—Preoperative gastrointestinal series showing central defect at base of duodenum

OPERATIVE PROCEDURE

From our experience with four cases and an analysis of the collected series, we feel that the following procedure should be carried out After the abdomen is opened, the upper cavity should be explored, with special attention to the stomach and duodenum In our four cases external examination of the stomach and duodenum revealed no abnormality If no lesion is found, the stomach should be opened very near the pylorus in its long axis In one of our cases we made a high opening in the stomach and then extended it through the pylorus and then, after excising the redundant mucosa, closed the stomach and duodenum in a longitudinal manner without doing a pyloroplasty This is the case in which a stricture at the pylorus resulted With the stomach open the gastric rugae should be thoroughly examined They should be placed on stretch in sections with a moistened sponge on a sponge holder Small ulcerations or growths concealed in one of these folds can be easily overlooked If no pathological conditions are found, attention should be directed toward the pylorus and duodenum If a prolapsed mucosa is present, it can easily be demonstrated It can be pulled back into the stomach as a circular fold with a pair of Allis forceps This fold should also be examined for growths or ulcerations Melamed[7] reports one case in which a large ulcer was found in the prolapsed mucosa Rubin[13] reports a case in which a resected specimen revealed malignant change The first portion of the duodenum should be thoroughly examined This can be facilitated by cutting through the pyloric ring in the long axis of the stomach The redundant fold is tented upward by grasping it at several places with Allis forceps A cleavage plane is developed between the mucosa and the submucosa about 1 cm proximal to the pyloric ring with a curved hemostat, and by blunt dissection it is separated transversely and circularly from the submucosa until the opposite cut edge is reached The raised redundant fold is then cut away The cut edges of the mucosa are then approximated and at the same time fixed to the submucosa with interrupted chromic 00 sutures The opening in the stomach and duodenum is then closed by some form of pyloroplasty, such as the Heineke-Mikulicz, Finney, or Horsley type If a growth or an ulcerated area is found, a gastric resection should be performed

REPORT OF CASES

Case 1 —A 55 year old Negro man complained of a pulling periumbilical pain of several years duration, which was aggravated by the taking of food He also gave a history of anal bleeding on two occasions, 18 and 12 mo previously Several weeks prior to admission he had a fainting spell following the passage of a large, liquid tarry stool Otherwise the history was essen

13 Rubin J S *Prolapse of Polypoid Gastric Mucosa* into the Duodenum with Malignant Change, Radiology 38:362 1942.

tially noncontributory The physical examination findings were also noncontributory except for a slight tenderness in the epigastrium on pressure and the presence of blood, both red and dark, on anal digital examination Sigmoidoscopic examination revealed a small rectal polyp, which was not bleeding. Biopsy proved it benign, and it was felt at the time that it was not the cause of the patient s complaints A gastrointestinal series revealed a central filling defect near the pylorus, giving a mushroomlike appearance, which was interpreted by the roentgenologist as a prolapsed gastric mucosa Other laboratory procedures revealed a hemoglobin content of 8 9 gm per 100 cc 4,100,000 red blood cells, and 5,200 white cells of which 69% were polymorphonuclear forms, 27% lymphocytes, 1% eosinophils, and 3% monocytes The urine was normal The blood urea nitrogen level was 44 mg per 100 cc , serum protein level 6.51 gm , and chlorides 600 mEq Gastric analysis after injection of histamine showed blood (4 +), 57 degrees of free hydrochloric acid and 97 degrees of total acid The electrocardiogram was normal, x ray studies after a barium enema showed no abnormalities, and chest x ray (posteroanterior) was normal

On Dec 20 a right rectus muscle splitting incision was made The upper abdominal cavity was explored and found normal Transgastric exploration revealed a prolapsed mucosa through the pylorus A 4 cm fold of mucosa was excised The stomach was closed in its long axis without pyloroplasty For six days postoperatively the patient had persistent pyloric obstruction and distention Thereafter the course was uncomplicated until discharge Two weeks later the patient was readmitted to the hospital with persistent vomiting. Serial x-ray studies of the upper gastrointestinal tract revealed complete pyloric obstruction On reoperation a dense mass of adhesions surrounding the pylorus was found, and exploration of this area was unsatisfactory A gastroenterostomy was performed The patient s convalescence from this operation was uneventful, and when seen four months later he was asymptomatic and gaining weight

Normal	14
Hyperacidity	8
Hypoacidity	3
Not indicated	19

Case 2 —T B a 42 year old white man complained of a weight loss of about 1 lb (0 5 kg.) a day for the last two months weakness in the legs, anorexia, and epigastric discomfort He gave no history of constipation, hematemesis nausea or vomiting, or tarry stools The history was otherwise noncontributory except for chronic alcoholism for many years but none for the past year The physical examination findings were normal Laboratory procedures revealed 3,790 000 red blood cells a hemoglobin content of 14 gm per 100 cc (90%), and a color index of 1 2. The gastrointestinal series revealed a deformity at the pylorus that the roentgenologist interpreted as a possible early carcinoma of the stomach With this diagnosis in mind an exploratory laparotomy was performed No lesion could be seen or palpated in the pyloric end of the stomach The stomach was opened in its long axis near the pylorus There was evidence of a chronic gastritis throughout and there was a redundant mucosa which herniated through the pyloric ring into the duodenum A Heineke-Mikulicz pyloroplasty was performed

After surgery the patient s symptoms disappeared, and two and one half years later he is still asymptomatic.

Case 3 —Mrs P E an 81 year old white woman was well until three months before admission, when she began vomiting after each meal The vomiting increased in frequency and severity until she was unable to retain anything She also complained of epigastric discomfort, and there was some loss of weight. She had a cholecystectomy many years previous to admission The findings on physical examination were normal except for senility, moderate dehydration a small incisional hernia which contained no abdominal viscera and severe generalized osteoarthrosis Laboratory procedures revealed 4,800 000 red blood cells, a hemoglobin content of 14 5 gm per 100 cc 10 000 white cells of which 80% were polymorphonuclear forms and 20% small lymphocytes The hydrochloric acid level of the gastric contents was [illegible] The [illegible]

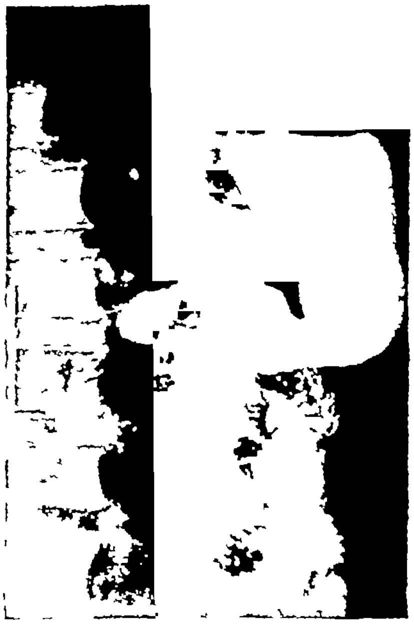

Fig 3 (case 3)—Preoperative gastrointestinal series showing central filling defect near base of bulb The gastric rugae can be traced into the defect

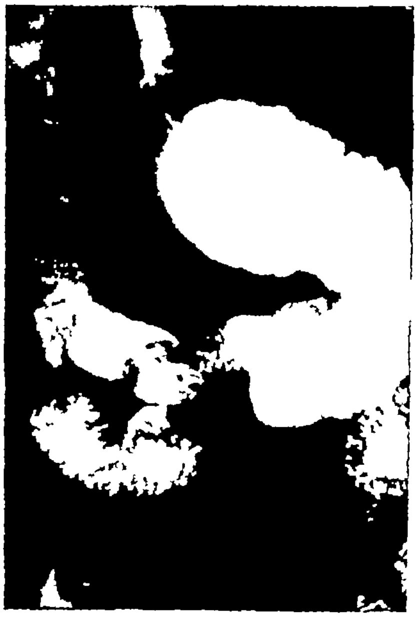

Fig. 4 (case 4)—Gastrointestinal series showing prolapsed mucosa into duodenum and large duodenal diverticulum at junction of second and third portion of duodenum normal The blood urea nitrogen level was 14 mg per 100 cc, serum protein level 7 2 gm, and chlorides 600 mEq Kahn and Kolmer reactions were negative The electrocardiogram revealed definite evidence of myocardial disease, x-ray studies after a barium enema disclosed diverticulosis of the sigmoid, and the gastrointestinal series showed a prolapsed gastric mucosa Because of the protracted vomiting, which did not respond to conservative therapy, an exploratory laparotomy was performed Transgastric exploration revealed a prolapsed gastric mucosa The redundant mucosa was excised, and a Heineke Mikulicz pyloroplasty was performed The ventral hernia was repaired in closing the abdominal wall The patient did not do well after surgery She became lethargic, and on the seventh postoperative day tachycardia, dyspnea, and many rales in both lungs developed In spite of digitalis, supportive drugs, oxygen, and other measures she died Complete autopsy revealed no anatomical cause of death

Case 4[14]—M R, a 65 year old Negro woman was admitted to Charity hospital on Dec 1, 1947, with the chief complaint of having vomited about 500 cc of coffeegrounds material the day before admission and later of passing several tarry stools Further questioning revealed that she had intermittent attacks of epigastric pain, indigestion, and occasional attacks of nausea and vomiting for the past two years There had been a loss of weight of 40 lb (18 1 kg) due to a low caloric diet prescribed by her physician for hypertension The following were the positive physical findings The blood pressure was 160/80 mm of mercury, the mucous membranes were pale, and an aortic systolic murmur was noted Rectal examination revealed black stool on the examining finger, which on a benzidine test gave a 4 + reaction for blood Laboratory studies revealed a hemoglobin content of 6 5 gm per 100 cc, 2,500,000 red blood cells, 3,555 white cells, of which 60% were polymorphonuclear forms, 34% lymphocytes, and 6% monoctyes The hematocrit reading was 19% The urine was normal Blood chemistry values were normal, and Kahn and Kolmer reactions were negative The gastrointestinal series revealed no definite abnormalities demonstrated on fluoroscopy The x-rays, however, showed prolapse of the gastric mucosa into the duodenum A diverticulum was noted in the region of the junction of the second and third portions of the duodenum There was no gastric retention The patient was placed on a high caloric, high protein diet and given a total of 1,500 cc of whole blood, raising the hematocrit reading to 38 mm On Dec 23, 1947, an exploratory procedure was performed through an upper right rectus muscle splitting incision The upper part of the abdomen was normal The stomach appeared and felt normal, except for a boggy mass in the pyloric region, extending into the first portion of the duodenum Transgastric exploration revealed a prolapsed gastric mucosa This was resected The gastrotomy opening was closed by a Heineke-Mikulicz pyloroplasty No attempt was made to remove the diverticulum The pathologist's report stated the specimen indicated chronic gastritis The postoperative course was uneventful A gastrointestinal series done on Jan 13, 1948, revealed no abnormality of the esophagus, stomach, or duodenum The diverticulum was again observed Six months postoperative the patient was asymptomatic and had gained 15 lb (6 8 kg)

SUMMARY

The literature of prolapse of the gastric mucosa into the duodenum is briefly reviewed Forty-one cases proved by surgery have been collected, and we have added four cases, one of which was previously reported The cause and the mechanism of the occurrence of prolapse of the gastric mucosa is not definitely known The lesion is probably a mechanical one based on a hypermotility of the gastric mucosa, which may be congenital or caused by conditions that produce abnormal motility that, over a period of time, loosens the mucosa from the submucosa to such an extent that a prolapse could occur Prolapse of the gastric mucosa is found more commonly in the older age group The majority of cases occur in the fourth and fifth decades The diagnosis cannot be made from the symptoms and physical findings X-ray is the most valuable aid in establishing a correct diagnosis A definite diagnosis can be made only by exploratory laparotomy and gastrotomy All patients with a prolapsed gastric mucosa should have a trial of medical management, which should include a bland, soft diet and antispasmodic drugs If they fail to respond to treatment in a month, an exploratory laparotomy is indicated When surgery is indicated, excision of the redundant mucosa with pyloroplasty gives excellent results

[14] This case has been reported previously

TUBERCULOUS MENINGITIS CURED WITH STREPTOMYCIN

REPORT OF A CASE COMPLICATED BY RENAL AND URETERAL CALCULUS

Joseph T Aquilina, M D, Batavia, N Y

Until the advent of streptomycin, tuberculous meningitis was a uniformly hopeless and fatal disease The first successful use of streptomycin in the treatment of tuberculous meningitis was reported in January, 1946, by Cooke and associates,[1] who treated a 1-yr-old infant In October of the same year Krafchik[2] reported apparent arrest of tuberculous meningitis in a 15-mo-old infant Hinshaw and his colleagues[3] reported on a series of 12 patients with generalized hematogenous tuberculosis, nine of whom had clinical evidence of tuberculous meningitis Of the nine, only four survived, and of those surviving only one is normal and was still receiving treatment five months after admission

Appelbaum and Halkin[4] report a case of tuberculous meningitis associated with miliary tuberculosis in a 9-yr-old boy, with complete recovery Mehas and Truax[5] report the case of a 31-yr-old white woman in whom tuberculous meningitis was arrested after administration of 282 gm of streptomycin over a period of 175 days, there was some residual neurological involvement, however

Smith, Vollum, and Cairnes[6] reported 18 cases of tuberculous meningitis, of which 11 patients survived In two cases, though the patients were treated as having tuberculous meningitis, the laboratory diagnosis of tuberculous meningitis could not be established The

From the Veterans Administration Hospital

Sponsored by the Veterans Administration and published with the approval of the Chief Medical Director The statements and conclusions published by the author are a result of his own study and do not necessarily reflect the opinion or policy of the Veterans Administration

[1] Cooke R E Dunphy D L and Blake, F G Streptomycin in Tuberculous Meningitis A Report of Its Use in a One Year Old Infant Yale J Biol & Med 18 221 (Jan) 1946

authors treated their patients with streptomycin for periods varying from 68 to 255 days, using both intramuscular and intrathecal routes The longest-treated patient received 510 gm intramuscularly and 13 63 gm intrathecally over a period of 255 days

This paper reports a case of bacteriologically proved tuberculous meningitis in an Indian male who recovered after a long course of streptomycin therapy By reporting this case, I hope to encourage the vigorous treatment of cases of tuberculous meningitis and to add mine to the number of other successfully treated cases

REPORT OF CASE

History —J H was a 24-yr -old Indian male who was apparently in good health until January 1947, when he began to complain of frontal headaches He went to a private physician who treated him for sinusitis, but the headaches became more severe He also had symptoms of an upper respiratory infection, such as running nose, watery eyes and a general feeling of malaise

On Feb 14, 1947, the patient was admitted to a private hospital because of nausea, vomiting, and severe frontal headaches of four days' duration On the day of admission his senses were clear and his temperature was 99 F Later his temperature began spiking between 101 F and 104 F with a mean temperature by rectum of 102 F After Feb 18 the patient was delirious, disoriented, and restless, and did not respond to questioning Reports from the private hospital indicated that he had paralysis of the external rectus muscles of both eyes There was a slight facial weakness on the left side The pupils reacted to light, and nystagmus was absent Tendon reflexes in the left arm and left leg were absent Babinski s sign could not be elicited Spinal fluid examination revealed a pressure between 550 and 580 mm of water The fluid was clear, and early cultures yielded no growth On Feb 23 a repeat spinal fluid examination revealed pellicle formation in the fluid There were 300 cells per cubic centimeter, with 100% lymphocytes A neurosurgical consultant suggested a diagnosis of viral meningitis and the patient was started on streptomycin He was given 1 gm per day in the hope that, if the meningitis were caused by an influenzal type of organism, there might be some improvement in his condition The drug was discontinued after three days because there was no improvement

The patient was then admitted to the Veterans Administration Hospital at Batavia N Y , on Feb 24 1947, in the same condition as was noted at the other hospital He could be aroused by stimuli, but his answers were unreliable Additional history obtained from the patient s brother revealed that the patient s mother had died 20 years previously of pulmonary tuberculosis

Physical Examination —The patient was a well-developed, well nourished Indian male His rectal temperature was 102 F , blood pressure 110/70 He was lying in bed in a semicomatose state The conjunctivas were clear The pupils were widely dilated, round, regular, equal, and reacted sluggishly to light and accommodation Bilateral abducens (sixth cranial nerve) paralysis was complete Other extraocular muscles appeared to be undisturbed Bilateral papilledema was observed The tongue was dehydrated coated and protruded in the mid line There was no pharyngeal paralysis The neck was rigid and painful when flexion was attempted Examination of the lungs, heart, and abdomen revealed nothing abnormal There were no petechiae Lumbar puncture shortly after admission revealed an initial pressure of 380 mm of water The dynamics were normal and the fluid had a ground glass appearance

Laboratory Findings —On the day of admission to the hospital examination of the spinal fluid revealed 480 cells per cubic centimeter It contained 89% lymphocytes the colloidal gold curve was 0000000000, proteins were 110 mg per 100 cc spinal fluid sugar was 40 mg per 100 cc and blood sugar 80 mg per 100 cc Spinal fluid was negative on smear for bacteria and the fluid was inoculated into a guinea pig and cultured Urinalysis was noncontributory Blood chlorides were 610.5 mg per 100 cc , the red blood count was 4 990 000 per cubic centimeter, the white blood count was 12 200 per cubic centimeter with differential consisting of 80% polymorphonuclear cells 17% lymphocytes, 3% monocytes, the hemoglobin was 14 gm per 100 cc the Wassermann reaction was negative

Course in the Hospital —Based on the clinical signs of meningitis and the initial spinal fluid findings intensive antibiotic therapy was started Initially, this consisted of penicillin 40,000 units every three hours intramuscularly on Feb 26, 1947 streptomycin was started concurrently At that time the exact dosage of streptomycin was just being formulated by various investigators, and the patient was started on what today are considered extremely large doses He was given 4 gm of streptomycin daily in divided doses (500 mg every three hours) X rays of the chest on Feb 25 revealed small calcific deposits in the right apex and small, ill-defined calcified deposits in the right upper lobe However, this was not considered active pulmonary tuberculosis X rays of the skull showed no abnormality The patient remained drowsy His temperature was 100 4 F rectally, and he could not be aroused Spinal tap on Feb 26 revealed an initial pressure of 540 mm of water, 35 cc of "ground glass" fluid was drawn and final pressure was 350 mm of water

On March 1, 1947 sulfadiazine was started The drug was given in this instance to cover the remote possibility that the condition was caused by a meningococcus infection which occasionally has been known to escape bacteriological detection On March 2 the patient improved slightly, and his temperature became normal for the first time He began responding to questioning and was able to take nourishment by mouth, the next day, however he became more lethargic Nuchal rigidity was still present, and a bilateral positive Babinski sign could be elicited Spinal fluid pressure was 550 mm of water The patient had to be catheterized On March 6 the temperature became normal and the patient responded to questioning although he still had hallucinations He took fluids and solids well and began to regain bladder control On March 7 sulfadiazine was discontinued because of nausea and emesis, although it was realized that the symptoms could well have been caused by increased intracranial pressure On March 15 penicillin was discontinued The spinal fluid pressure at that time was 200 mm of water Spinal fluid cell count was extremely high and consisted predominantly of lymphocytes In spite of the decrease in spinal fluid pressure the patient appeared lethargic and weak, and the prognosis was extremely poor On March 20, upon the advice of the Streptomycin Committee of the Veterans Administration who controlled the distribution and use of the drug in the Veterans Administration, the patient s streptomycin dosage was reduced to 225 mg every four hours intramuscularly On March 21 the spinal fluid pressure went up to 600 mm of water

On March 24, one month after the patient s admission I was informed that the initial cultures of the spinal fluid on Feb 19 and Feb 20 were positive for tubercle bacilli, this was the first bacteriological proof that the case was one of tuberculous meningitis At the same time, the inoculated guinea pigs were autopsied and found to have tuberculosis On March 24 the spinal fluid pressure was 190 mm of water and of ground glass appearance the cell count was approximately 400 cells per cubic centimeter predominantly lymphocytes On March 25 it was decided to start streptomycin 100 mg intrathecally daily On April 24 approximately a month later the patient was able to sit up for repeat X rays of the chest which revealed very small calcific deposits in the lung field chiefly on the right There had been no essential change from the admission X rays of the chest On April 25 the white blood cell count was 8 100 per cubic centimeter with 20% eosinophils 58% polymorphonuclear cells and 22% lymphocytes On May 6 the white blood cell count was 8 100 per cubic centimeter, with 26% eosinophils Eyegrounds revealed bilateral optic atrophy and the patient had shadow vision only On May

5 Mehas C P and Truax W E Streptomycin in Tuberculous Meningitis J A M A 135 155 (Sept 20) 1947

6 Smith H V Vollum D L, and Cairnes H Treatment of Tuberculous Meningitis With Streptomycin A Report to the Medical Research Council Lancet 1 627 (April 24) 1948

10 the spinal fluid revealed 146 cells per cubic centimeter, mostly lymphocytes, with 240 mg per 100 cc of protein, and the spinal fluid sugar was 45 mg per 100 cc On May 13 intrathecal streptomycin was changed to 100 mg every other day The patient was incontinent of urine and feces at that time

A week later, on May 20, on advice of the Veterans Administration Streptomycin Committee, the streptomycin was reduced to 50 mg intrathecally every other day On May 29 the patient was allowed to sit up in a chair On June 16 intramuscular streptomycin was discontinued because I wanted to see what effect withdrawal of the drug would have on the patient's general course, however, intrathecal streptomycin was continued bi weekly On June 19 the patient was able to walk short distances with the aid of an attendant At that time he had received a total of 245 gm of streptomycin over a period of 111 days The total number of rachicenteses was 73 He had received approximately 6 gm of streptomycin intrathecally His weight now was 102 lb, as compared with his average weight of 160 lb

On June 28, 1947, when it was considered that the patient was having a recurrence of tuberculous meningitis, intramuscular streptomycin was resumed at a dosage of 225 mg every three hours The ophthalmologist reported that light perception was absent in the left eye, and that the optic disks were pale bilaterally, indicating optic atrophy He thought that he could see a tubercle in the choroid of the left eye On Aug 16, 1947, the patient was using a walker He still had visual difficulty, being blind in the left eye, but vision was improving in the right eye He complained of severe weakness of the extremities

All streptomycin therapy was discontinued on Aug 23, the patient having received 350 8 gm of streptomycin intramuscularly over a period of 168 days and 6 95 gm of streptomycin intrathecally over a period of 85 days The patient remained afebrile without streptomycin until Sept 12, when his temperature and pulse rate became elevated, and he had frequent attacks of nausea, with emesis and abdominal pain No new physical findings were elicited, except tenderness in the left upper quadrant There was still weakness of the left side of the face and body and a few days later urinalysis revealed 80 to 120 white blood cells per high powered field When it became apparent that he had a urinary infection, sulfadiazine was initiated on Sept. 16 Streptomycin was withheld, and a repeat rachicentesis revealed the pressure to be 120 mm of water The fluid was clear and colorless, containing 8 lymphocytes per cubic centimeter and 35 mg per 100 cc of protein An intravenous pyelogram on Oct. 8 revealed a calculus in the right renal pelvis and lack of function of the left kidney (Fig 1)

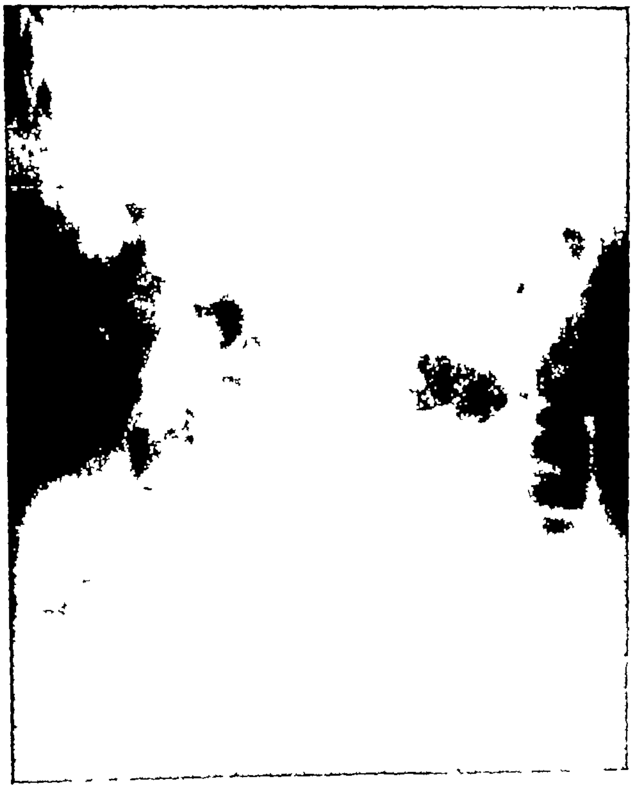

Fig 1 —Intravenous pyelogram on Oct. 8 1947 showing a calculus in right renal pelvis Note the absence of dye in left kidney

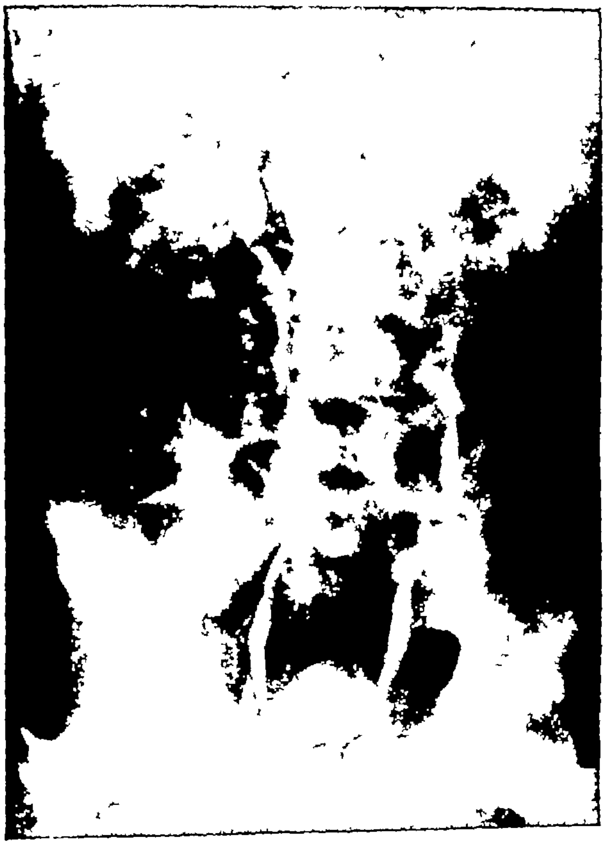

Fig 2 —Retrograde pyelogram on Oct. 23 1947 This demonstrates a large calculus in the right kidney right hydronephrosis and obstructing calculus in the left ureter

On Oct 23 cystoscopy and retrograde pyelogram revealed severe cystitis, ureteritis, right hydronephrosis with a stone in the pelvis of the right kidney, and an obstructing calculus in the left ureter (Fig 2)

On Nov 6 the left kidney was explored A nodular mass in the left ureter was excised and a stone 1 mm in diameter was removed Nephrostomy was then performed to drain urine from the left kidney On repeated attempts to catheterize the left ureter, the catheter met an obstruction On Jan 20, 1948, the Foley catheter in the left nephrostomy wound was accidentally cut by a ward attendant, and a new catheter could not be reinserted through the left nephrostomy wound into the left renal pelvis The wound continued to drain a small amount of urine, but no urine drained into the left ureter

Another intravenous pyelogram on Feb 12, 1948, showed no excretion on the left side but good excretion on the right

Cystoscopy was performed several times, but each time the left ureteral catheter met an obstruction Cultures for acid fast bacilli were negative

The urologist consultant thought that the patient had tuberculosis of the right kidney and a functionless left kidney The patient was sent to a convalescent center on June 24, 1948, for a period of three months. He returned Sept 22, 1948, to the Veterans Administration Hospital in Batavia for further observation and convalescence Physical examination at that time revealed a healthy looking Indian male, well oriented, alert and walking with the aid of a cane He weighed 150 lb He could see well with his right eye, but vision with the left eye was still poor The right pupil reacted to light and accommodation, the left pupil did not. His blood pressure was 130/100, the heart tones were good The left nephrostomy wound had closed The left leg showed slight decrease in diameter, and there was some slight weakness of the *right leg Positive bilateral* Babinski signs could still be elicited The ophthalmologist reported 20/30 vision of the right eye but no light perception of the left eye There still was bilateral optic *atrophy, more pronounced* on the left X rays of the chest showed no change from the previous examination An intravenous pyelogram revealed in the right upper quadrant dense, laminated, oval shadows that had the appearance of stones in the pelvis of the right kidney Iodopyracet injection U S P (diodrast®) was excreted promptly on the right There was no excretion on the left The right pelvis was still slightly dilated The urinalysis was noncontributory The blood proteins were 7 1 gm per 100 cc The specific gravity of the urine ranged between 1 001 and 1 010 The Wassermann test was negative The blood urea was 14 9 mg per 100 cc , red blood cell count 4,670,000 per cubic centimeter, white blood cell count 6,750 per cubic centimeter and hemoglobin 13 5 gm per 100 cc On culture and guinea pig inoculation the urine proved to be negative for tubercle bacilli

The patient was discharged on Nov 2 1948 On Nov 15 he was admitted to the Rehabilitation Center of the Veterans Administration Hospital, Bath N Y , where he underwent an intensive physical medicine rehabilitation As part of this program intravenous and retrograde pyelograms were performed on *Dec 16, 1948* These revealed bilateral nephrolithiasis, a large laminated calculus in the right renal pelvis and a left ureteral calculus (Figs 3 and 4) Function of the right kidney was good the left kidney showed no function The patient was then *trans*ferred to the urologic service It was thought best to remove the functionless left kidney It was decided that the right kidney should be operated upon first, however in order to prevent possible anuria from the large calculus which might act as a ball valve and shut off the patient s only functioning kidney A right pyelolithotomy and nephrostomy was then performed, and mush phosphatase calculus was extracted from the right part of the pelvis

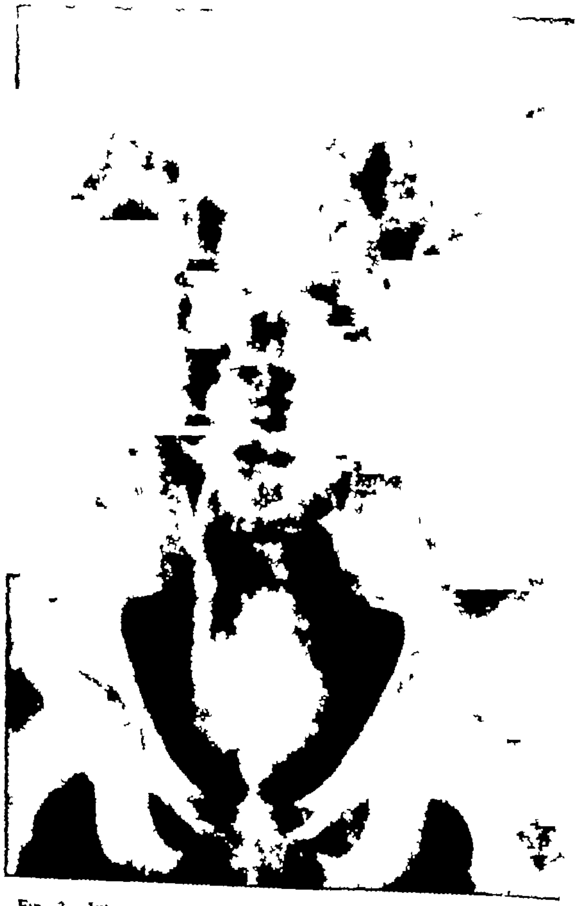

Fig 3 — Intravenous *pyelogram on Dec 16 1948* again showing the large calculus in the *right kidney* and lack of function of the left kedney Excretion of dve by the right kidney was prompt.

The postoperative course was stormy The patient became uremic, the nonprotein nitrogen went up to 77 mg and he had marked singultus The blood chlorides were *385 mg per 100 cc* His temperature was 100 F On intravenous fluid and supportive therapy he improved considerably On Jan 6, 1949, *the nephr* tomy tube from the right kidney fell out and could not be inserted An intravenous pyelogram showed good function *the right* On Jan 13 a left nephrectomy was performed Pat *logic* examination of the left kidney revealed left pyelonephr and chronic ureteritis The stone proved to be triple phospha There was no gross or microscopic evidence of tuberculosis the left kidney On Jan 25 *an intravenous* urogram reveal good kidney function on the right, and the patient was tra ferred back to the Rehabilitation *Center*, where he underwent course of medical rehabilitation *During* this period his intel *gence quotient* was 96 His only symptoms were slight weakn in the *left leg* and absence of vision in the *left eye* He was d charged June 22, 1949

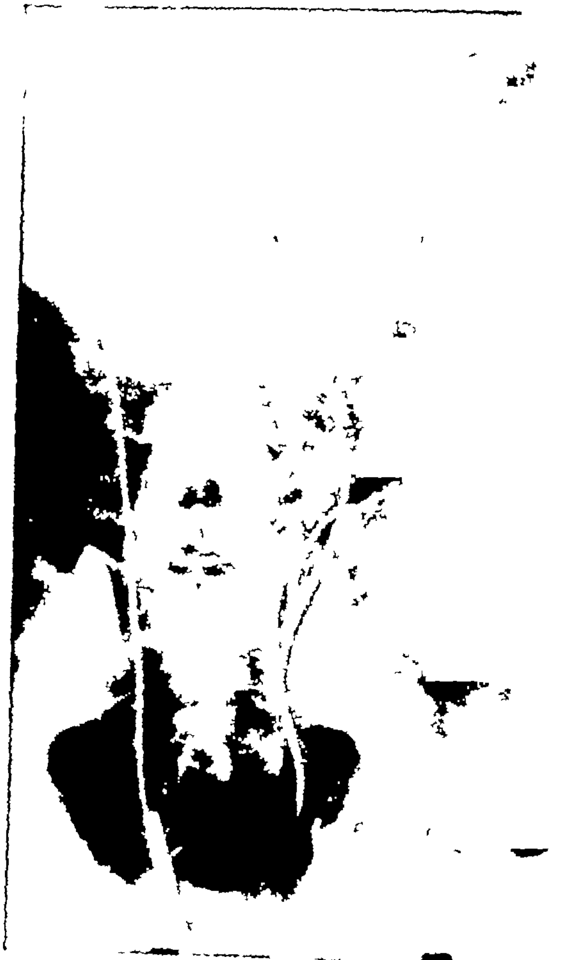

Fig 4 —Retrograde pyelogram on Dec 16 1948 *Note* again the l laminated calculus *this time more clearly outlined.* Also note the calc in the left ureter

The patient was readmitted to the Veterans Administrati Hospital *Batavia*, in *December 1949 for follow-up* He a peared well nourished, *alert*, and cooperative The only positi findings on physical examination were absence of vision in t left eye and slight weakness of the left leg, which were noted the time of his discharge from the Bath Rehabilitation Center June 1949 Spinal fluid examination and *blood chemistry* we normal Urinalysis, however, revealed a low grade urinary tra infection that completely cleared on penicillin therapy Intelli gence quotient was 101 After a short period of observation th patient was discharged to his home on an Indian reservation

COMMENT

So far as I have been able to determine, this is the only case of recovery from tuberculous meningitis in an Indian male With the exception of a few days, the patient was under vigorous and continued treatment from Feb 26, 1947, through Aug 23, 1947, and he received over a period of 168 days 350 8 gm of streptomycin intramuscularly, and over a period of 85 days 6 9 gm of streptomycin intrathecally During this course of treatment the only sign of sensitivity to the drug was a marked eosinophilia for several days, this disappeared without cessation of drug therapy or reduction in dosage This was also noted by Mehas and Traux in their case [5]

The spinal fluid pressure and analysis returned to normal on Aug 12, 1947, approximately six months after initial treatment A complete spinal fluid examination elicited normal findings on Oct 6, 1947, and Dec 6, 1949

The patient was cured of his tuberculous meningitis, and except for urinary complication he made a remarkable recovery, the only residuals being blindness in the left eye and slight weakness in the left leg

As to the pathogenesis of the calculus formation in the urine, we can only speculate I feel that this calculus formation, which resulted in the removal of the left kidney, was the result of demineralization of the bones, associated with a prolonged bedrest Added to this may have been insufficient quantities of fluids and the large doses of streptomycin The patient is alive and well and has been followed for three years since the onset of his illness

SUMMARY

A case of tuberculous meningitis, treated by streptomycin, is presented The diagnosis was established by culture and guinea pig inoculation The patient was alive and well three years after the onset of his illness The treatment consisted of 350 8 gm of streptomycin administered intramuscularly over a period of 168 days, and 6 9 gm intrathecally over a period of 85 days Calculus formation was observed as a complication, and the only residuals of tuberculous meningitis were blindness is the left eye and slight weakness of the left leg

Veterans Administration Hospital

Drug Therapy of Hypertension—The time is not yet ripe for a final assessment of the value of drug therapy in the management of hypertension Current opinion may, however, be summarized as follows brief reduction in pressure in emergency can be achieved with nitrites or T E A B (tetraethylammonium bromide) heavy sedation with barbiturates will result in some reduction in pressure in most cases for as long as the narcosis is maintained, the long term reduction of pressure in at least a proportion of established cases of hypertension can be achieved by the ganglionic blocking action of the methonium drugs, and their use constitutes probably the most encouraging forward step in the drug therapy of hypertension at the present time Careful assessment of each individual case in respect of response dosage and tolerance is required, there is no rule-of-thumb schedule of dose to be followed, occasional serious toxic effects occur, and complete failure to respond, especially with oral administration, is fairly common Preparations of *Veratrum* and other vegetable derivatives are still under trial, and their general use in practice is far from practicable —Ian G W Hill, M B The Drug Treatment of Hypertension *The Practitioner,* June, 1951

CLINICAL NOTES

BONE MARROW AND FAT EMBOLISM FOLLOWING MULTIPLE FRACTURES

S W Berkheiser, M D
and
Horace K Giffen, M D , Youngstown, Ohio

Fat embolism secondary to trauma of the skeletal system has long been recognized and frequently reported Bone marrow embolism has also been observed, but seldom reported, and it has rarely received prominence in the literature

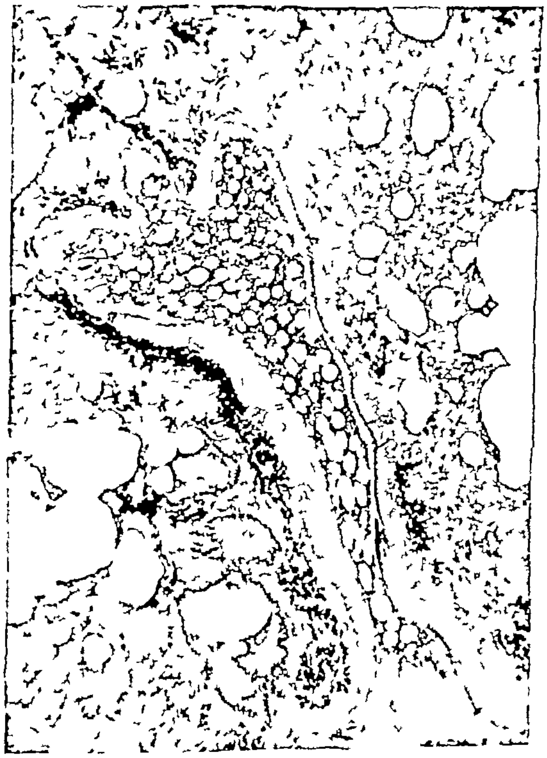

Fig 1 —A branch of pulmonary artery (1 0 mm) almost completely filled by bone marrow embolus Hematoxylin-eosin stain (× 35)

In 1943, Schenken and Coleman [1] reported a single case associated with a fracture of the left femur, and cited one case from the German literature [2]

Survey of the literature up to 1948 reveals only three additional cases, which were reported by Lindsay and Moon [3] Their first case was associated with multiple injuries and a fracture of the right femur The remaining two cases were associated with multiple fractures of the skeletal system Schenken and Coleman found bone marrow emboli in two (1-2 mm) branches of the pul-

monary artery In each of Lindsay and Moon's cases, bone marrow emboli were found in a single branch of the pulmonary artery

It is the purpose of this paper to report a case of widespread fat and multiple bone marrow embolism following fractures of the right radius, right temporal bone, and right supraorbital ridge Bone marow emboli were found in four branches of the pulmonary arteries

REPORT OF CASE

A white man, 82, was admitted to South Unit, Youngstown Hospital on March 18, 1950, because of pain in the right wrist after a fall at his home Roentgenogram revealed a comminuted fracture of the distal portion of the right radius with slight posterior dislocation of the carpal bones of the hand The fracture was reduced with the patient under general anesthesia (ether) There was some difficulty in attainment of adequate anesthesia however, reduction of the fracture was performed smoothly The patient appeared in good condition on return to the ward and conversed freely with fellow patients Two hours after his return to the ward he was found dead in bed approximately six hours after admission

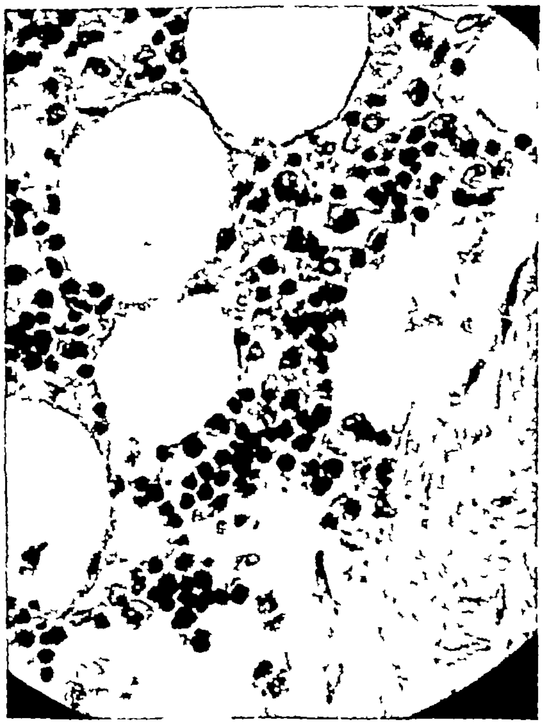

Fig 2—Constituents of bone marrow embolus Hematoxylin-eosin stain (X 600)

Autopsy revealed a poorly developed and poorly nourished elderly white man The fracture of the right wrist was in good position The significant gross findings were moderate generalized arteriosclerosis, moderate cardiac dilatation and hypertrophy (heart weight 470 Gm), pronounced pulmonary edema, and moderate arterial nephrosclerosis Examination of the skull revealed an unsuspected fracture of the right supraorbital ridge and fracture of the right temporal bone There was a small subdural hematoma underlying the fracture sites Externally the brain showed slight diffuse cortical atrophy and congestion The principal histologic findings were limited to the lungs There was decided edema and early bronchopneumonia bilaterally Dilatation and congestion of the pulmonary vessels and interalveolar capillaries were pronounced One of the sections of the left lower lobe included a branch of the pulmonary artery which measured 1 0 mm in diameter The lumen of this vessel was almost completely occluded by a large fragment of bone marrow (fig. 1) This fragment contained mature fat cells immature and mature forms of the erythrocytic and myeloid series, together with several megakaryocytes (fig 2) Two smaller and adjacent branches measuring 0 1 mm in diameter, respectively, contained similar fragments within the lumens (fig 3)

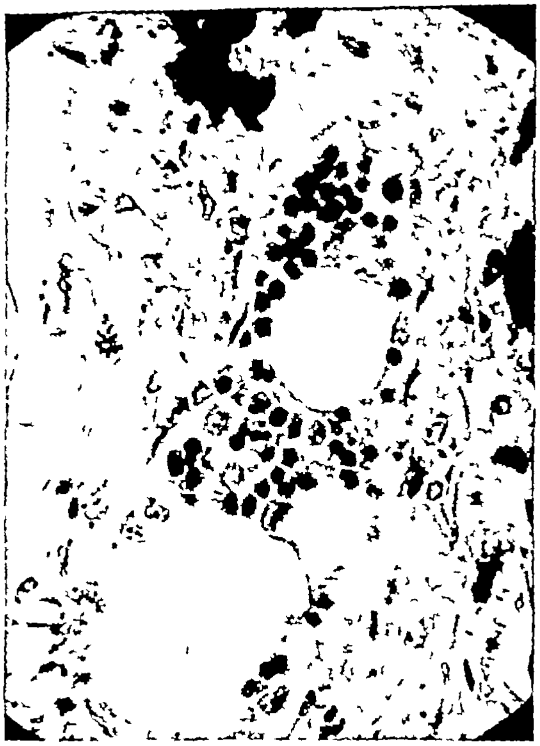

Fig 3—Small branch of pulmonary artery (0 1 mm) from same lung as in figure 1 Hematoxylin-eosin stain (X 600)

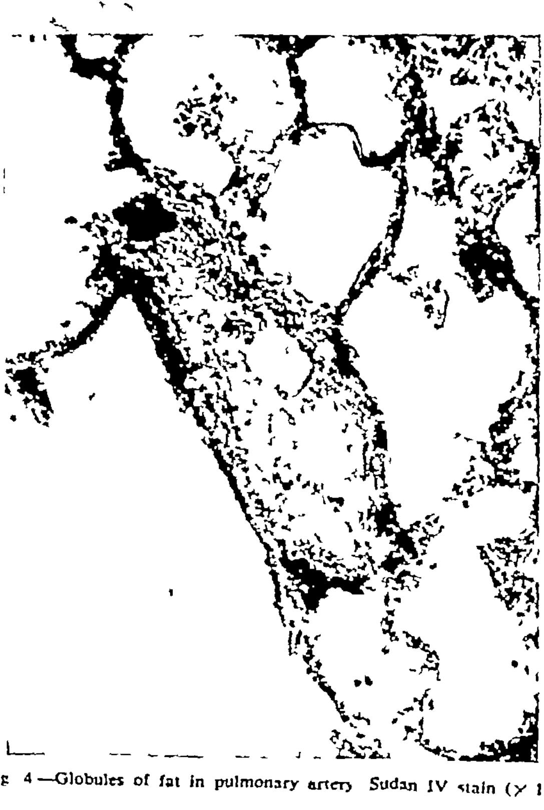

Fig 4—Globules of fat in pulmonary artery Sudan IV stain (X 130)

One of the sections of right lower lobe included another small branch of the pulmonary artery measuring 0 3 mm in diameter which also contained a fragment of bone marrow within the lumen The embolus within the larger vessel was traced by serial sections and was found within the lumen for a distance of approximately 150 μ Multiple frozen sections of both lungs were made and stained with Sudan IV Numerous globules of fat were found within the lumens of many of the pulmonary arteries, and smaller droplets of fat were present within the interalveolar capillaries (fig 4) Similar frozen sections of heart, liver, and kidneys failed to reveal the presence of fat within the arteries and capillaries of these organs

COMMENT

Since there were fractures of the right radius, right temporal bone, and right supraorbital ridge, one cannot with assurance determine the source of the bone marrow and fat embolism The right radius seems the most probable source, even though the fracture involved the distal rather than the proximal portion Since bone marrow emboli were demonstrated in three branches of the pulmonary artery of the left lung and within one branch of the right lung, the process was apparently diffuse and widespread Moreover, massive fat embolism was demonstrated within many of the pulmonary arteries of both lungs The unexpected death was presumably due to widespread fat and bone marrow embolism

SUMMARY

A case of fat and multiple bone marrow embolism of the lungs is reported The patient died unexpectedly after reduction of a fracture of the right radius The cause of death is attributed to widespread fat and bone marrow embolism

ADDENDUM

Since this paper was submitted 27 additional cases of pulmonary bone marrow embolism have been reported by Rappaport, Raum, and Horrell (Bone Marrow Embolism, *Am J Path* **27** 407, 1951)

CHYLOTHORAX AND CHYLOPERITONEUM

REPORT OF A CASE OCCURRING AFTER EMBOLISM OF LEFT SUBCLAVIAN VEIN WITH THORACIC DUCT OBSTRUCTION

Morton Palken, M D
and
Russell W Weller, M D , Framingham, Mass

Chylous fluid is rarely found within the serous cavities This accumulation of fluid may be caused by obstruction or injury of any portion of the thoracic duct Although the thoracic duct is usually a single structure that empties into the left subclavian vein, it is variable both in structure and venous termination It may consist of multiple trunks in the thorax with cross communications, it may have multiple venous terminations in left or right subclavian, internal or external jugular, innominate, vertebral or azygos veins There may be communications with iliac or lumbar veins, vena cava inferior, or left renal vein

With complete obstruction of the thoracic duct, intraductal pressure increases and distal lymphatics dilate and rupture, producing chylous effusions if no collateral channels exist If obstruction occurs slowly, collaterals may develop sufficiently to prevent chylous effusions

Yater [1] studied 24 cases of thoracic duct obstruction from various causes, only three developed chylous effusions Washburn,[2] in a study of 12 cases of thoracic duct obstruction, found only one with chylous effusion Chylous ascites may occur with or without chylothorax and vice versa, despite high obstruction of the thoracic duct In Yater's series, there is a case of extensive chylothorax and chylopericardium without chylous ascites, caused by obstruction of the veins and thoracic duct in the neck by metastatic carcinoma

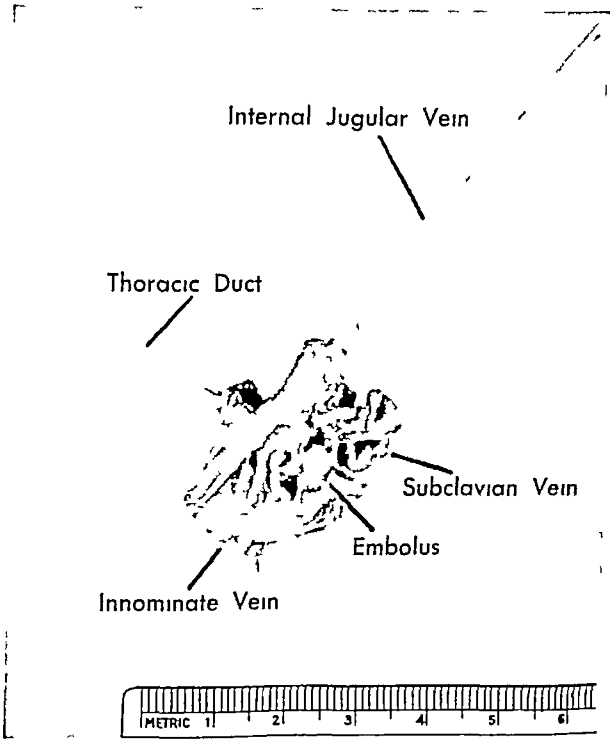

Fig 1 —Photograph of fixed specimen showing thoracic duct, veins and embolus.

The causes of chylous effusion in order of frequency are extrinsic compression or intrinsic occlusion by metastatic neoplasm, tuberculosis, thrombosis of the left subclavian or innominate veins, perforating lymphangitis, filariasis, and effusions secondary to thoracic duct trauma The fluid varies considerably depending on the amount of protein, inflammatory or neoplastic exudate, and lipid content

Few cases of chylous effusion secondary to thrombosis of neck veins are reported, whereas thrombosis of these veins without chylous effusion is relatively common [3] Bauer [4] described the case of a woman aged 41 with pleural and ascitic chylous effusions resulting from thrombosis, of unknown etiology, of the left subclavian and innominate veins In three months, 12,550 ml of chylous fluid was removed from the pleural cavities and 30,050 ml of similar fluid from the peritoneal cavity The thoracic duct was dilated and had three openings into the left subclavian vein, all of which were

occluded by the thrombus Little and others[5] described a case of thrombosis of the left internal jugular vein and probable thrombosis of the left subclavian vein, presumably traumatic in origin, with chylothorax and chyloperitoneum Yater[1] mentioned briefly four somewhat similar cases

REPORT OF A CASE

A man aged 58 was admitted to Cushing Veterans Administration Hospital for the fourth time on April 20, 1950, with a generalized skin rash of four years duration He was first admitted in October, 1946 Skin biopsy was performed at that time and again in January, 1950, both times the diagnosis was mycosis fungoides In December, 1946, he received x ray treatments to the extremities without demonstrable effect He received a course of nitrogen mustard in 1949, resulting in slight temporary regression of skin lesions At the time of his final admission to the hospital, he complained of nausea, vomiting, and abdominal cramps, in addition to the intense pruritus and weeping of the skin

Physical examination revealed an emaciated man with generalized, severe exfoliative dermatitis His pulse rate was 116, respiration 24, temperature 96 F, blood pressure 106/50 There was marked fissuring at the angles of the mouth and the tongue was smooth and red Coarse rales were present in both lungs, with dulness over the right upper lobe posteriorly Examination of the heart elicited negative findings The liver edge was palpable 10 cm below the right costal margin The prostate was moderately enlarged One plus pitting edema of both legs was present The inguinal and axillary lymph nodes were firm and up to 4 cm in diameter

Laboratory studies revealed a hemoglobin value of 12 gm per 100 cc hematocrit 34% leukocyte count 28 000, with 24% segmented neutrophils 4% band neutrophils, 28% lymphocytes, and 44% eosinophils Urine contained 1+ albumin, 4 to 5 erythrocytes and 2 to 3 leukocytes per high power field Sedimentation rate (Wintrobe, corrected) was 0 mm per hour Total serum protein was 4 4 gm per 100 ml, formol gel test negative, and cephalin flocculation test negative The van den Bergh reaction was 0 2 mg per 100 ml direct and 0 7 mg per 100 ml indirect

The patient s condition gradually became worse, although he took fluids including milk freely On April 24, 1950, the patient received 1,000 ml of 5% dextrose in isotonic saline solution and 1 000 ml of 10% dextrose in water into a left antecubital vein At 5 p m on April 25, 1950, nitrogen mustard (methyl bis [beta chlorethyl] amine hydrochloride) 0 2 mg per kilogram of body weight, was injected into a left antecubital vein At 2 15 a m April 26, 1950, the patient was found dead in bed

Autopsy was performed at 9 30 a m April 26 1950 The skin of the entire body was erythematous with extensive desquamation and fissuring The abdomen was slightly distended Firm, discrete lymph nodes up to 4 5 cm in diameter were present in the axillary, inguinal and femoral regions There was 1+ pitting edema of the feet and ankles Three hundred and twenty milliliters of milky fluid were present within the peritoneal cavity The liver edge was 7 cm below the right costal margin Firm lymph nodes up to 2 6 cm in diameter were present in the periaortic region retroperitoneally There were fibrous adhesions at the apex and base of the right lung There was *no* fluid in the left pleural cavity The right pleural cavity contained 50 ml of milky fluid The hilar lymph nodes were firm and up to 3 cm in diameter

The lumbar lymphatic trunks were dilated to 0 2 cm, the cisterna chyli to 1 cm, and the entire thoracic duct from 0 5 cm to 1 cm in diameter The thoracic duct opened by a single orifice into the left subclavian vein posteriorly near its junction with the internal jugular vein Overlying this orifice and slightly adherent to the intimal surface of a valve in the subclavian vein was a smooth reddish gray thrombus 2 cm long and 0 6 cm in diameter No other intrinsic or extrinsic thoracic duct obstruction could be found

Both lungs were congested and edematous The heart was of average size and the coronary arteries were thickened and calcified but patent In the posterior portion of the interventricular septum was a focus of fibrosis 2 cm by 4 cm by 3 cm The aorta was arteriosclerotic, with ulcerations and adherent thrombi in the abdominal portion The spleen, pancreas, and adrenals were not remarkable The liver was large and weighed 3,000 gm Cut section revealed a friable, pale-yellow parenchyma with prominent lobules Kidneys, ureters bladder, and testes were not remarkable The prostate weighed 40 gm and was moderately firm with nodular lateral lobes

Examination of the chylous fluid revealed a specific gravity of *1 010*, total protein 280 mg per 100 ml, a few lymphocytes and occasional neutrophils and fat globules staining orange with Sudan IV

Microscopic examination of tissues revealed small focuses of fibrosis in the myocardium, occasionally infiltrated by eosinophils, lymphocytes, and brown pigment-laden phagocytes The lungs were congested and edematous, with numerous neutrophils and eosinophils present in some bronchi, bronchioles, and surrounding lung alveoli Numerous eosinophils were present in the red pulp of the spleen There was a diffuse fatty infiltration of the liver, with alcoholic hyalin present in liver cells Widened portal zones with proliferation of bile ducts and numerous lymphocytes and eosinophils were noted There was slight nodular hyperplasia of the adrenal cortices Occasional small cortical scars in the kidneys with hyalin intimal thickening of the small arteries were observed Nodular hyperplasia of the prostate gland was present The basement membranes of the testicular tubules were thickened and spermatogenesis was decreased Sections of skin revealed parakeratosis, acanthosis, and, in some sections marked prolongation of rete pegs with thinning of intervening epidermis There were large focal collections of eosinophils, lymphocytes, neutrophils, and large cells with

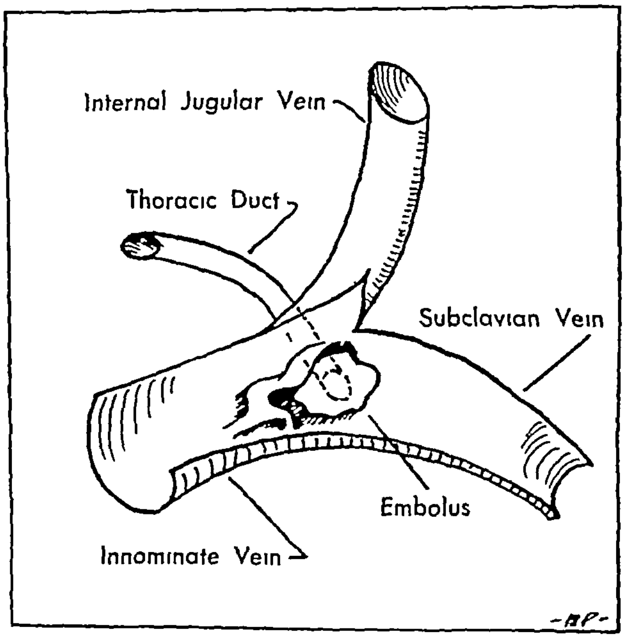

Fig 2 —Schematic representation of Figure 1

basophilic cytoplasm and large multilobated nuclei in the superficial dermis The bone marrow was hyperplastic and the eosinophilic series was predominant The normal architecture of the abdominal lymph nodes was incompletely replaced by a granulomatous process with minimal fibrosis and numerous eosinophils, swollen reticulo-endothelial cells, and large cells with basophilic cytoplasm, multilobated nuclei, and prominent nucleoli The thoracic duct was dilated but otherwise not abnormal Sections through the junction of the thoracic duct and subclavian vein demonstrated a thrombus in the vein consisting of erythrocytes, fibrin, neutrophils, and islands of platelets One side of the thrombus was undergoing early organization On the surface of the thrombus adjacent to the thoracic duct opening were a few fibrin tabs

[5] Little J [illegible] Harrison C and Blalock [illegible] Chyloperitoneum Effects of [illegible] of [illegible] 11 392 1942.

On the basis of the findings at autopsy, the diagnosis was chylous ascites and right chylothorax, dilatation of thoracic duct, Hodgkin s disease of skin, granuloma type (mycosis fungoides), with metastases to abdominal lymph nodes, arteriosclerosis of coronary arteries and aorta, focal fibrosis of myocardium bronchopneumonia, edema and congestion of lungs, fibrous pleuritis, eosinophilic hyperplasia of bone marrow, portal cirrhosis, arterionephrosclerosis, hyperplasia of prostate, and nodular hyperplasia of adrenal cortex

The immediate cause of death was severe inanition caused by widespread involvement of the skin by Hodgkin s granuloma (mycosis fungoides)

COMMENT

The presence of chylous fluid in the right pleural and peritoneal cavities of a patient with Hodgkin's disease of the skin prompted a careful examination of the entire thoracic duct The duct was demonstrated to be a single trunk, markedly dilated up to its termination, where an embolus occluded its opening into the left subclavian vein

The evolution of this embolus may be explained as follows As a result of intravenous therapy, thrombosis of the antecubital veins occurred A subsequent injection into one of these veins dislodged a thrombus, which lodged as an embolus caught by the subclavian valve overlying the opening of the thoracic duct The presence of early fibroblastic organization at the periphery of the thrombus, and the absence of any fibrous attachment to the subclavian vein, support this explanation

SUMMARY

A report of a case of Hodgkin's disease of the skin, with the unusual finding of an embolus in the left subclavian vein obstructing the orifice of the thoracic duct and resulting in chylous ascites and chylothorax, is presented

Veterans Administration Hospital, Framingham, Mass

Medical Education —The most important element in medical education *is theory, not practice* All practice—even driving a nail—is based upon some sort of theory, however nebulous Given good theory any reasonably adept person can be taught good practice, but without sound theory practice is misdirected and may become positively dangerous That is not to deny that good theory can come from practice The bedside *is the clinician s* laboratory and provides in addition the ultimate test for any medical theory A tremendous amount of valuable observation has been gained from that source But while it remains only observation *it is still purely empirical* Before such facts can be woven into fruitful scientific theory they must be sorted in various combinations, checked experimentally against working hypotheses in the laboratory, and finally verified at the bedside once again under properly controlled conditions —A A *Abbie*, M D , The Academic Aspect of Medical Education, *Medical Journal of Australia* June 1951

AIR EMBOLISM IN PNEUMOPERITONEUM

A Gerson Hollander, M D , Oakland, Calif

Air embolism is a dramatic and often catastrophic complication of pneumoperitoneum It follows the entrance of large quantities of air into the pulmonary venous system through a systemic vein Fortunately, its incidence is rare, but it occurs more frequently than the occasional report in the literature would seem to indicate [1] The growing popularity of pneumoperitoneum in the treatment of pulmonary tuberculosis and its ease of administration seem certain to increase the frequency with which an embolism is met by the general practitioner as well as the phthisiologist

The purpose of this report is to add three more cases of air embolism to the literature and stress the clinical application of the observations of Durant [2] and his coworkers, who have provided a simple effective method for coping with this emergency

REPORT OF CASES

CASE 1 —C A P , a white man aged 24, was discovered to have pulmonary tuberculosis in 1944 A right phreniclasia and pneumoperitoneum were induced in January, 1947 but, soon after, he left the hospital against advice and abandoned this procedure He was readmitted to the hospital in September, 1947, and because of the presence of bilateral cavitary disease with positive sputum, it was decided to reinstitute his pneumoperitoneum Under local anesthesia and using a closed technique with three way stopcock and syringe, a 19 gauge blunt needle was easily inserted into the right upper quadrant of the abdomen No blood was obtained on manipulation of the syringe and 300 cc of air was given slowly and without incident, when suddenly the patient became very excited and tried to jump off the table The needle was promptly withdrawn and the patient restrained Acute cardiac collapse—marked pallor tachycardia, tachypnea, and profuse perspiration—developed, and he kept screaming that he was dying He was *incontinent of urine and feces*, and a left hemiplegia developed He was given sedation and maintained in the head down position, and he soon quieted down Within four hours he had regained some use of his left arm and leg The next morning with the exception of inability to control fine movements of his fingers and some diminution in sensorium on the left, he had completely recovered Within 48 hr he was entirely normal When examined recently (June 1950) he had shown no sequelae It might be noted that though his left pupil was dilated and fixed to light during the acute stage *his fundi* were normal, and no air bubbles were seen in the retinal vessels.

CASE 2 —In T L a white man aged 56, pernicious anemia developed in 1929 and pulmonary tuberculosis *in* 1945 He was hospitalized for his tuberculosis in 1946, and pneumoperitoneum was instituted in March, 1947 He required 800 to 1,000 cc of air at weekly intervals to maintain a pressure of + 7 to + 12 with adequate rise of the diaphragm On Dec 16 1948 under local anesthesia and using a closed system with three way stopcock and syringe a 19 gauge needle was introduced into the peritoneal cavity Drawing back on the syringe revealed a free air space,

and the manometer registered + 7 One thousand cubic centimeters (1 000 cc) of air was given, a final reading of + 12 obtained and the needle withdrawn The patient got off the table, walked across the room and, as he started to put on his bathrobe, fell unconscious to the floor In spite of the absence of pulse and respiration when examined by another physician in the room at the time artificial respiration, oxygen and cardiac stimulants were given but the patient was dead Autopsy revealed a small hemorrhage subperitoneally and in the abdominal musculature, with a large amount of air separating the layers of muscle tissue This extended over an area 6 cm in diameter surrounding a perforated vein The right auricle and right ventricle contained a large amount of air and a small amount of blood These were mixed and frothy in character The pulmonary artery and its two branches contained air and frothy blood, as demonstrated by inserting a needle into these vessels and obtaining a sample of their contents before the heart or great vessels were opened

CASE 3 —C E B, a white man aged 26, was first discovered to have pulmonary tuberculosis in 1945 A left pneumothorax was begun in November, 1946 and discontinued in August, 1947, because it was ineffective Pneumoperitoneum was started on Dec 8, 1947, and continued with 1,000 cc of air being given at weekly intervals with the maintenance of a pressure of + 8 to + 10 He had a succession of irregular discharges and was admitted to this hospital for the third time on Aug 13, 1948 He had not taken his treatment regularly while at home, and fluoroscopy revealed only a small pocket of air under the right diaphragm On Aug 24 1948 pneumoperitoneum was done Under procaine hydrochloride (novocaine®) anesthesia, and using a closed system, a 19 gauge needle was inserted into the right upper quadrant Manipulation of the syringe revealed a free air pocket and a reading of + 2 to + 4 was obtained One hundred cubic centimeters of air was given with little change in pressure reading A second hundred was allowed to run in with a pressure of + 8 After the administration of 50 cc more, the patient coughed and attempted to sit up The needle was promptly withdrawn Almost immediately he became apneic and intensely cyanotic and had incontinence of urine and generalized clonic contractures of all extremities He was immediately placed in the left lateral position His pulse became stronger, respirations returned, and cyanosis disappeared within five minutes Oxygen was administered but within 15 min the patient had recovered sufficiently to be returned to his ward Neurologically, he had weakness of the left arm and leg which cleared completely within eight hours Recent examination (June, 1950) revealed no sequelae

COMMENT

Air embolism as it is usually encountered in pneumoperitoneum occurs as a result of the entrance of massive quantities of air into a systemic vein, transported to the right heart where it produces an acute obstruction to the outflow tract of the right ventricle Experimentally, Durant[2] and his co-workers have shown that this is a mechanical obstruction and can be relieved by placing the patient on his left side In this position the outflow tract lies inferiorly to the body of the right ventricle and the air trap disappears The air is churned into froth, mixed with the blood, and transported to the lungs, where excretion occurs This procedure is frequently effective even when the patient appears moribund It must be remembered that a large quantity of air is necessary to produce this condition, and it may take considerable time before all the air is excreted The patient should be kept in the left lateral position until it has been determined that the obstruction is completely relieved Occasionally this may take several hours with recurrence of symptoms when the patient is returned to the decubitus position[3] The use of oxygen and cardiac stimulants are of little value unless the mechanical block is relieved promptly

It should be noted that it is standard practice in this hospital to use the head-down (modified Trendelenburg) position and a closed system in administering pneumoperitoneum as prophylactic measures to prevent this complication Nevertheless air embolism was encountered three times in the past three years during which approximately 3,000 treatments were given Two of these were definitely venous while the third might have been arterial

SUMMARY

Air embolism as a complication of pneumoperitoneum occurs more frequently than the literature would seem to indicate

Three cases, one fatal, exhibiting this syndrome have been described

The effectiveness of the left lateral position in the treatment of this condition is stressed

UVEOPAROTID FEVER

William Saphir, M D
and
Irwin Dvore, M D, Chicago

Uveoparotid fever is a chronic inflammatory disease of the uveal tract of the eye with enlargement of the parotid glands, often running a febrile course, and frequently complicated by paralysis of the facial nerve[1] The condition was first described by Heerfordt in 1909[2] An extensive review and an analysis of 47 cases was presented by Garland and Thompson in 1933[3] These authors were so convinced of the tuberculous etiology of the disease that they proposed the name uveoparotid tuberculosis, particularly in view of the fact that only half their cases ran a febrile course They based their assumption on a few recorded necropsies, on results of guinea pig inoculations, on a frequently found family history of tuberculosis, and on favorable results of tuberculin therapy

In 1936, Bruins Slot[4] first suggested that, because of the similar pathological picture and occasional coexistence of Boeck's sarcoidosis and Heerfordt's syndrome, uveoparotid fever is merely another form of sarcoidosis A number of cases of sarcoidosis with uveoparotid fever have since been reported, chiefly in the ophthalmological literature[5]

An additional such case is here presented, not only because of the relative rarity of the disease, but also because of the importance of keeping sarcoidosis in mind if confronted with failing vision and uveitis

REPORT OF A CASE

Mrs D C, a 33-year-old Negro woman, was admitted to the medical department of the Cook County Hospital September 3, 1950 For the past six months she had noticed a gradual failing of her vision, so that reading or fine house work had become increasingly difficult For the past four weeks symptoms of a 'chest cold" were present with a tight feeling around the chest, an unproductive cough, and some shortness of breath, particularly on exertion In addition general weakness, anorexia, and increasing exhaustion with lassitude and lack of energy induced her to seek hospital admission The past history revealed three attacks of pneumonia, the last one in 1945 requiring hospitalization The family history disclosed close contact to tuberculosis, with the mother succumbing to this disease in 1938

The physical examination revealed a poorly nourished Negro woman, apparently chronically ill and looking much older than the stated age The blood pressure was 118 systolic and 72 diastolic, the pulse rate was 80, and the respiratory rate 18 Significant findings were a slight bilateral conjunctival and pharyngeal injection and a generalized multiple moderate lymph adenopathy involving both the lateral and posterior cervical and axillary glands The chest appeared normal to percussion and auscultation The heart was not enlarged, the rhythm was regular, and the sounds were clear The abdominal findings were not remarkable On the extensor surfaces of both legs a reddish purple maculopapular eruption was noted The deep and superficial reflexes were present and there was no gross evidence of any neurological abnormality

Laboratory findings disclosed a normal urine a hemoglobin value of 73%, a blood cell count of 4 490,000 erythrocytes, 5,930 leucocytes, with a differential count of 58% neutrophils, 21% lyphocytes 13% monocytes and 4% eosinophils The Kahn test was negative The blood value for the nonprotein nitrogen was 28 mg per 100 cc, the total protein was 7 gm per 100 cc, with an albumin fraction of 4 2 gm per 100 cc and a globulin of 2 8 gm per 100 cc The blood chlorides were 100 mEq a liter, the sodium, 135 mEq a liter the icteric index, 5 units, and the value for diastase, 8 units An x ray of the chest showed the heart to be normal in size Considerable bilateral hilar adenopathy with parahilar streaky extension was noted Views of the paranasal sinuses failed to demonstrate abnormalities X-rays of hands and skull likewise revealed normal structures A dermal tuberculin test with old tuberculin 1 1000 failed to elicit any reaction

Course—There was a low grade fever not exceeding 100 2 F orally The patient was treated symptomatically without significant improvement On the seventh hospital day a rapidly increasing swelling involving both parotid glands and extending into the retromandibular and submaxillary areas developed in the patient There was mild tenderness over the affected region, and a definite nodularity could be felt The consultant in contagious diseases considered these findings as secondary to the systemic disease and not due to epidemic parotitis Meanwhile, the consultant opthalmologist had completed his examination and reported his findings as granulomatous iridocyclitis compatible with Boeck's sarcoidosis The dermatological consultant regarded the manculopapular skin eruption of the legs as compatible with sarcoidosis A biopsy of the parotid gland was suggested, but permission was refused by the patient

The patient s condition remained unchanged without further progression of the involved areas until September 21, when she signed her release and, despite advice to the contrary, left the hospital

COMMENT

There is little doubt that our case fulfilled all the criteria of uveoparotid fever as manifested by uvetitis, bilateral parotitis, and a low-grade fever Additional evidence of Boeck's sarcoidosis was present in form of a generalized and marked mediastinal lymphadenopathy There was a skin eruption suggesting sarcoidosis, there was a negative dermal tuberculin reaction so frequently encountered in sarcoidosis, and there was a history of exposure to tuberculosis There was no involvement of the osseous system and no hyperglobulinemia

Our case was remarkable in that failing vision preceded other symptoms by many months In fact, it was only after hospital admission that the parotitis suddenly made its appearance and suggested the possibility of uveoparotid fever That ocular symptoms can precede other manifestations of uveoparotid fever and sarcoidosis is also apparent in the case reported by Kirby and Armstrong[6] It would seem reasonable to assume that the true nature of an obscure uveitis with failing vision might be disclosed by a thorough and systematic search for evidence of sarcoidosis In view of the recent advancements in the treatment of tuberculosis, the early diagnosis of sarcoid uveitis may have added significance in future therapeutic endeavours It is readily admitted that the old controversial question of whether Boeck's sarcoidosis is a disease per se, or a special form of tuberculosis has not been settled Recent findings demonstrating a tuberculin neutralizing factor in the serum of patients with sarcoidosis[7] may be considered additional evidence for a definite though obscure relationship of this disease to tuberculosis

SUMMARY AND CONCLUSIONS

A case of Heerfordt's uveoparotid fever is presented Failing vision due to sarcoid uveitis preceded by many months other manifestations of uveoparotid fever and sarcoidosis A thorough search for eveidence of sarcoidosis is suggested in any case of obscure uveitis

DETERMINATION OF VENOUS PRESSURE WITHIN ESOPHAGEAL VARICES

Major Eddy D Palmer
Medical Corps, United States Army

A knowledge of the pressure within esophageal varices may be important in evaluating the success of short-circuiting operations for portal hypertension The theoretical and practical implications of such information are quite obvious, particularly as they apply to immediate estimations of the patency of the shunt, possible sources of hemorrhage continued in the postoperative period, and slight changes in the postoperative portal pressure with the passage of time

Measurements of the pressure may be made during esophagoscopy with the simple equipment used for the sclerosing treatment of esophageal varices—esophagoscope and injecting needle—plus a water manometer such as that used in determining spinal fluid pressure But as simple as is the equipment, the technique is very difficult, and one is often hard put to judge the validity of the readings obtained One of the two main difficulties is that of accomplishing the procedure without exerting pressure on the more proximal segment of the varix with the end of the esophagoscope, thus increasing the pressure within the vein The other difficulty involves the

---

From the Gastrointestinal Section Walter Reed Army Hospital Washington D C

obtaining of readings at a time when the patient's thorax is at complete rest in partial expiration, so that a Valsalva or reversed Valsalva effect does not falsely influence the intravenous pressure

Intravariceal pressures have been measured on 14 occasions in six patients, usually just prior to injection therapy The readings obtained on 12 occasions had to be discarded because there was uncertainty as to whether the needle had been in proper position or whether there had been pressure exerted on the proximal portion of the varix The Eder-Hufford esophagoscope and the Eder injecting needle (21 gauge with 2 5 mm shaft) were used From the point of the needle to the base of the manometer the length of the apparatus measured 65 cm Isotonic saline solution was used as the counterbalancing medium, in a system which was, of course, open

REPORT OF CASES

Case 1 —A 28 year old man was hospitalized because of sudden massive hematemesis The diagnosis of Banti s disease was made, the clinical studies showing among other things, large esophageal varices and normal liver The spleen was removed and an end to side spleno renal shunt made The venous pressure in a mesenteric vein was 310 mm of saline solution prior to construction of the shunt, and 110 mm at the completion of the operation Postoperatively the patient did well an esophagogram failed to demonstrate varices and two intravenous pyelograms showed the left kidney to be normal The patient was returned to full military duty Five and a half months after the operation, minor hematemesis led to rehospitalization, and 10 days later there was another brief but serious hemorrhage Complete gastrointestinal x-ray studies and gastroscopy gave no evidence of a bleeding source but esophagoscopy showed minor, probably inconsequential, varices just above the cardia An intravenous pyelogram again indicated normal function in the left kidney, suggesting adequate renal venous flow It was felt that the vascular anastomosis was probably still patent An unrelated circumstance precluded attempts to confirm the matter by postprandial comparisons of blood sugar levels drawn from the antecubital vein and, by catheter from the vena cava at the level of the left renal vein In view of the fact that the varices were the only demonstrable potential bleeding source, sclerosing therapy was considered Prior to the first treatment, however, the pressure within one of the varices was measured, under esophagoscopic conditions which were felt to give valid readings Two determinations showed pressures of 125 and 110 mm It was felt that these readings proved the patency of the spleno-renal shunt, and that the varices should be considered merely subclinical remnants of the previous portal hypertension

Case 2 —A 43 year old white man had first been studied three years previously because of hematemesis At that time he was found to have advanced Laennec s cirrhosis with esophageal varices Hemorrhage continued at intervals during the next three years, and he was then hospitalized for operation A portacaval shunt was made Immediately after the operation, esophagograms failed to reveal the previously demonstrated varices, but esophagoscopy and gastroscopy showed, as they had prior to operation, rather large varices in both organs There was however, no further bleeding At esophagoscopy six weeks after operation the venous pressure readings made under conditions felt to be satisfactory for valid determinations were 135 and 135 mm Such a pressure level was felt to indicate that the operation had accomplished the desired effect—an effect which could not be appraised by mere visualization of the varices

CONCLUSION

Measurement of the pressure within esophageal varices by means of a needle introduced by way of the esophagoscope may give information, not obtainable by other means, useful in the evaluation of the success of portal-shunt operations

COUNCIL ON PHARMACY AND CHEMISTRY

REPORT TO THE COUNCIL

The Council has authorized the publication of the following report from the Committee on Pesticides

Robert T Stormont, M D, *Secretary*

The following article is the third in a series on aspects of pesticides of immediate medical interest The Committee wishes to acknowledge the assistance of the following persons who reviewed the manuscript Dr J M Barnes Secretary, Toxicity Committee Medical Research Council, England Dr M J Dallemagne, University of Liege Belgium Dr Edward A Doisy Jr, St Louis University Dr Francis F Heyroth, University of Cincinnati Dr Edward F Knipling United States Department of Agriculture Washington D C and Dr Bernard P McNamara, Army Chemical Center Maryland

Bernard E Conley, *Secretary*
Committee on Pesticides

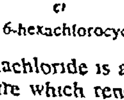
TOXIC EFFECTS OF TECHNICAL BENZENE HEXACHLORIDE AND ITS PRINCIPAL ISOMERS

Benzene hexachloride is one of the newer synthetic insecticidal agents used in the control of insects of economic and public health importance Like DDT, it has been known as a chemical entity for many years but needed the stimulus of entomologic research to bring it out of laboratory obscurity It was first synthesized by the photochlorination of benzene by Michael Faraday in 1825 The insecticidal properties of the crude chlorination product were discovered independently, almost simultaneously, in France and England at the beginning of the last decade Different samples of the crude chemical gave varying results in early trials and investigations were directed toward uncovering the insecticidal fraction of the product Additional studies in England in early 1943 showed that greatest activity resided in the gamma isomer which composed 10 to 35% of the technical mixture The association of this isomer with insecticidal activity fostered further research on the improvement of technical preparations of benzene hexachloride which has culminated in the commercial production of essentially pure (99%) gamma benzene hexachloride, now widely known as lindane

Although incorrect chemically, the name benzene hexachloride and its abbreviation, BHC, have been generally accepted as common designations for commercial mixtures of the stereoisomers of 1, 2 3, 4, 5, 6 hexachlorocyclohexane Five isomers have been isolated of which the gamma isomer is of greatest entomologic and medical interest Lindane is the coined, common name for essentially pure grades of this isomer which are used for agricultural and related purposes The generic name, gamma benzene hexachloride, has been adopted by the Council on Pharmacy and Chemistry for this constituent as used in medicinal preparations

In the pure state, the isomers of benzene hexachloride are well defined white crystals which are without pronounced odor but possess a bitter taste Technical or commercial benzene hexachloride is a cream-colored, crystalline compound which is distinguished by a persistent and penetrating musty odor that varies somewhat with the method of manufacture

The structural formula may be represented as follows



1,2,3 4,5 6-hexachlorocyclohexane

Technical benzene hexachloride is a relatively stable preparation with a vapor pressure which renders it sufficiently volatile to enable it to act as a *fumigant*, although reducing its residual effectiveness in comparison with DDT It exhibits the same instability to alkalis as DDT, but it is more stable than the latter in the presence of metals and their salts The crude mixture is insoluble in water but its solubility in organic solvents varies with the nature and concentration of the several isomers and the impurities present. Technical benzene hexachloride and lindane may be used in dusts, in wettable powders, in solutions of organic solvents, and as a constituent of paints. The technical product and, to a lesser extent, lindane, produce off flavor in several types of agricultural crops and in some processed foods during storage, thus limiting their use. Other uses are limited by its objectionable odor, especially that associated with technical benzene hexachloride. Because of these factors and the relative lack of insecticidal effectiveness in its constituents other than the gamma fraction, technical benzene hexachloride of a higher gamma content and insecticide preparations of lindane are being produced.

PHARMACOLOGY

The pharmacology of technical benzene hexachloride and its principal isomers has been as intensively investigated as any chlorinated hydrocarbon insecticide, with the possible exception of DDT. Nevertheless, much remains to be learned concerning the biologic complexities of the metabolism and pharmacologic actions of the technical mixture and its several constituents. Comparatively little is known about the detoxification mechanisms and the influence of nutrition and environment on the susceptibility or resistance of various animal species to poisoning from these compounds. Even less is known about the effects of technical benzene hexachloride or its various components on enzyme systems in animal organisms. These and other deficiencies in basic knowledge are common to the chlorinated hydrocarbon insecticides and a number of drug and drug like materials in common use. Unfortunately, the lack of such information precludes precise statements about many aspects of the metabolism of and susceptibility to technical benzene hexachloride and lindane.

Action.—Animal studies indicate that technical benzene hexachloride acts as a stimulant to the central nervous system and produces hyperirritability, lack of muscular coordination, convulsions and death. That the different isomers of technical benzene hexachloride vary in their pharmacologic action is most evident in the antagonism between the gamma and delta isomers when separately or successively administered intravenously. The gamma isomer is a strong excitant of the central nervous system and produces acute responses in animals generally similar to those induced by the technical product. The delta isomer is a depressant of the central nervous system tending to antagonize the stimulating effects of the gamma isomer. The alpha and beta compounds are more intermediate in their action. The alpha isomer predisposes to an initial state of hyperexcitability which is followed by depression, and the beta constituent provokes tremors and then depression of the central nervous system on prolonged administration.

The gamma isomer also acts more rapidly than technical benzene hexachloride, eliciting responses in laboratory animals which may continue for 24 hours within 30 minutes after ingestion. Technical benzene hexachloride acts more slowly. Evidence of stimulation does not appear until one or two hours after ingestion and then may persist for as long as four days. The alpha isomer, which constitutes 50 to 70% of the technical preparation, may contribute to this delayed effect since stimulatory effects under the above conditions do not appear for 24 to 48 hours. Death of the animal may then be deferred for four or five days.

Metabolism.—Technical benzene hexachloride may be absorbed into an animal's body by way of the gastrointestinal tract, the respiratory tract, and from the skin. The rate and extent of absorption through these avenues of entrance varies depending on the physical properties of the insecticide formulations and the physiologic characteristics of the tissues involved. Absorption of the technical mixture from the alimentary tract is not readily accomplished. The presence of fat or other lipoids facilitates penetration of the intestinal barrier. Cutaneous absorption of the material from oil solutions has been firmly established. Absorption of dusts from the skin of animals is known to occur, but less is known about absorption from the respiratory tract. Physicochemical factors such as the size of particulate matter in dusts, fogs, mists and smoke concentrations, the duration of exposure to vapor, and the presence of absorbable vehicles in the formulation influence the ease and extent to which dangerous amounts of technical benzene hexachloride or lindane may be admitted to the body by this route.

On entrance into the animal body, technical benzene hexachloride is distributed to the various organs and tissues. It has been found in the blood, liver, spleen, adrenal glands, muscle tissues, brain, kidney, and fat of treated animals. Storage is greatest in fat tissues although it is also deposited in significant amounts in the liver and kidneys. The distribution and extent of storage of the several isomers in various organs varies with individual isomers and, perhaps to some degree, with the species of animal exposed.

Striking differences in fat storage of the various isomers of technical benzene hexachloride have been reported. Maximum storage of the isomers is accomplished in about six weeks, and the greatest accumulation occurs with the beta isomer, which is also stored the longest. The concentration of the alpha isomer built up by tissue lipids is twice that which is contained in the whole diet. The beta isomer is concentrated to 10 times the dietary concentration, and the gamma and delta isomers are deposited at the same concentration as contained in the diet. Emulsifiers in the formulation increase absorption, thereby enhancing storage of the isomers. Animal studies indicate that storage is higher in females than in males. Young animals have also been found to store more benzene hexachloride than older animals. The significance of these findings lies in the direct correlation between the storage of the several isomers in fat tissue and their ability to cause chronic poisoning.

Gamma benzene hexachloride is eliminated in the urine, in the feces, and in the milk of lactating animals. In rats on a diet of 100 and 500 PPM of the gamma isomer it is rapidly eliminated and completely disappears from the body within one to two weeks. A maximum amount is excreted in the milk in approximately 24 hours after feeding is stopped. The alpha isomer is rapidly mobilized from the fat, disappearing in about four weeks, and the delta fraction is excreted at about the same rate as the gamma. In contrast the beta compound requires an estimated three to six months for complete removal from the body following cessation of exposure to the toxicant. The significance of the mere presence of the isomers in fat tissue is unknown. Damage may occur, however, when these agents come into contact with other tissues during transport to and from the fat. It can be especially serious when such tissues have experienced previous injury since it may lead to further impairment of function, a complication common to most chlorinated hydrocarbon compounds and the basis for present concern about the long term implications of cumulative chemicals of this nature.

Little is known about the metabolic fate of technical benzene hexachloride or its constituents. In vitro tests suggest that the gamma isomer is at least partially destroyed in the liver. A material giving an ultraviolet absorption curve similar to that for 1,2,4 trichlorobenzene was found in the neutral and acidic fractions of urine of laboratory animals receiving the alpha isomer. Further tests for this intermediate were inconclusive and led to the suspicion that alpha benzene hexachloride has a highly variable metabolism. In vivo studies indicate that stereochemical changes in the tissues involving the transformation of the other isomers to the more acutely toxic gamma isomer do not occur. Little information is available on the influence of benzene hexachloride or its components on enzyme systems.

Since consistent findings are lacking only the broadest generalities concerning susceptibility of various animal species to technical benzene hexachloride and lindane are possible. Available evidence points to the general conclusion that dogs and rabbits may be the mammals most susceptible to gamma benzene hexachloride, followed by mice, rats, guinea pigs and the larger domesticated animals. Diet and sex appear to be secondary to the age and the absorptive capacity of the animals. Young calves are much more susceptible than adults of the species. Wide variations occurring even among individuals in a given species emphasize the dominant role the absorption mechanism plays in susceptibility. Tolerance to progressively increased concentrations of benzene hexachloride or the gamma isomer has not been observed.

TOXICOLOGY

Technical benzene hexachloride is about equal to DDT in acute toxicity to man and other warm blooded animals. The gamma isomer is the most toxic fraction of the technical mix ture It is about twice as toxic as DDT, and the alpha, delta, and beta constituents have been estimated to be approximately one half one fourth and one twenty fourth as poisonous respectively The other known isomers are present in the technical mixture in such small amounts that they do not contribute significantly to the chronic toxicity of technical benzene hexachloride which is about one half that of DDT In the technical mixtures the beta isomer plays the most important role in chronic intoxication since it is stored in the fat tissue longer than the other isomers and since being the most chemically stable in the body it is the least readily destroyed On a similar comparative basis the gamma isomer is thought to be about one-quarter as poisonous because of its minimal storage rapid elimination and decreased disposition to tissue damage

Oral Toxicity —When technical benzene hexachloride is administered orally, it is of a relatively low order of acute toxicity A wide range of dosage may prove toxic or fatal because of the varying amounts of the several isomers which may appear in technical mixtures It has been estimated that approximately 600 mg /kg or about an ounce of technical benzene hexachloride containing 15% gamma isomer could be fatal in a single dose for an adult The estimated single, oral fatal dose for lindane is less than one-quarter this amount These estimates have not been completely confirmed by human experience although a case noted elsewhere in this report describing an attempted suicide suggests that these are reasonable approximations of the amounts which could be fatal for adult human beings

The chronic oral toxicity of essentially pure gamma formulations is not as great as that of the technical product because of the absence of the beta isomer Liver degeneration and nutritional disturbances however, have been induced in dogs exposed to the gamma isomer over long periods of time Nevertheless, the likelihood of cumulative effects is not as great because of the fairly rapid loss of this constituent from fat depots

Cutaneous Toxicity —Technical benzene hexachloride is a moderate skin irritant without demonstrated sensitizing properties Irritating effects to the eyes, skin and mucosa are principally attributable to the delta isomer and may be elicited by both dry forms and solutions of the technical preparation Irritation of the skin is most noticeable when perspiration is present and application of water to the affected areas has been found to increase the stinging sensation Systemic toxic reactions from skin contact with dry formulations of technical benzene hexachloride are fairly remote because of the poor absorption of the compound in this form The danger of absorption is increased with prolonged handling of powders and dusts because of the possibility of small particles penetrating the integument Prolonged frictional contact of the skin with technical benzene hexachloride impregnated cloth may cause systemic toxic reactions if the chemical is present in sufficient quantities Animal experiments indicate that the amounts of gamma isomer which could be used safely to impregnate clothing would be too small to be advantageous for this purpose

Cutaneous absorption of both oily and aqueous suspensions of gamma benzene hexachloride has resulted in fatalities in laboratory animals Death among cattle from dips and sprays of both lindane and the technical material has also been reported Solutions of either the gamma or the technical mixture in lipoid and other organic solvents are readily absorbed and offer the greatest danger The high dermal toxicity of the gamma isomer in lipoid solvents is especially noteworthy In solution with kerosene or other solvents of a similar nature it penetrates the skin rapidly The lethal dose for rabbits by a single cutaneous exposure has been reported to be similar to that for nicotine

Since the gamma isomer offers skin hazards in the presence of lipoid material its use in an ointment for scabies is recommended only under medical supervision It may be used safely in 1.0% concentrations if prolonged or repeated applications are avoided and if precautions are taken to prevent contact with the eyes or other sensitive areas about the face The presence of secondary infection does not interfere with this medicinal use

Inhalation Toxicity —Little precise information has been recorded in the medical literature on the inhalation effects of benzene hexachloride Signs of illness were not observed in experimental animals exposed to the vapors of the gamma isomer for several months In a six months experiment with exposure to dusts of benzene hexachloride, liver and kidney damage in one of ten mice and questionable damage in a chicken were noted Initial pneumonitis and pulmonary granulomas observed in the remaining animals appeared to be foreign body reactions to the clay used in the dust In a second experiment five mice were exposed for one hour to an atmosphere containing 10 mg per liter of technical benzene hexachloride One mouse died in two days, the remaining animals had brief spasms but recovered in two days These studies suggest that the vapor and dust hazards from the technical compound may be of a low order nevertheless the customary precautions against prolonged or excessive inhalation of vapors or dusts should be observed and more care should be taken when oil base sprays are used

Pathology —Benzene hexachloride gives a pathologic picture resembling that of DDT, with liver damage the most prominent feature The beta isomer is mainly responsible for liver necrosis although the gamma isomer alone has caused such injury A moderate degree of hyaline granular degeneration of the renal convoluted tubular epithelium as well as mild changes in the bone marrow, lymphoid tissues adrenal cortex, and cerebrum, have been observed in animals poisoned by the technical mixtures of the isomers Considered anatomically, these lesions have not always been sufficient to cause death The alpha isomer produces the same type of liver and renal damage as the gamma isomer and general emaciation atrophy of various tissues, and lesser injury to other viscera also have been noticed

The pathologic findings in acute fatal gamma poisoning have not always been characteristic in animals There is a marked distention of the stomach and intestines with gas and fluid and, in several fatalities in large animals rupture of the stomach has been an unexplained finding Congested edematous lungs dark fluid blood distended liver of black or bluish color with patches of necrosis, contracted dark spleen and a pale soft brain mottled with pin point hemorrhages have also been found

Symptoms—The symptoms which may be expected in acute poisoning from technical benzene hexachloride are excitation, clonic tonic convulsions followed by hyperirritability to external stimuli and finally depression Intoxication from benzene hexachloride of high gamma content or from the gamma isomer alone is manifested by restlessness micturition, intermittent muscular spasm loss of equilibrium convulsions, and then collapse and death The potassium level of the blood may increase, but the calcium concentration remains the same The course of symptoms depends largely on the proportion of the isomers in the technical compound the onset and severity being in direct proportion to the amount of gamma isomer which is present The immediate cause of death is functional disturbances of the central nervous system, and especially of the respiratory center

Chronic symptoms are predominantly those of nervousness and lack of coordination their severity depending on the frequency and level of exposure Nausea weight loss and general emaciation are signs which may be anticipated from this type of exposure to the technical mixture

The diagnosis of benzene hexachloride poisoning should be based mainly on a history of exposure to the product since poisoning by other pesticides as well as the presence of other neurological conditions should be considered

There is no specific antidote for poisoning from benzene hexachloride or its gamma isomer Treatment should be directed toward removing the ingested material from the stomach and intestinal tract by gastric lavage and saline catharsis and counteracting the central nervous system stimulation Since the preparation is slowly absorbed after ingestion prompt institution of removal procedures will rid the body of large amounts of the toxicant but oil cathartics for intestinal evacuation should not be given because oils favor absorption

Central nervous system manifestations can be antagonized by the administration of a barbiturate phenobarbital being the best physiologic antidote Subsequent symptomatic dose of a short acting barbiturate such as sodium pentobarbital may be necessary to control the violent convulsive seizures Epinephrine should be avoided because it might produce ventricular fibrillation After recovery from the acute stages of poisoning the patient should be kept on a fat free or low fat diet and should be treated for liver and renal damage

Precautions —Technical benzene hexachloride and lindane are less dangerous on an overall basis than certain other types of chemicals in common use on the farm and in industry Nevertheless, these pesticidal chemicals and many of the other ingredients used in their formulations have intrinsic toxic properties which demand that caution be observed in their handling and application The following precautions, based on usage and experience with benzene hexachloride and related types of compounds, are believed to provide adequate protection under various circumstances and types of exposure

1 *Dusts and Powders* Special care should be taken to avoid excessive inhalation or skin contact when handling mixing or applying BHC dusts and powders Protective measures sufficient to keep the material out of the eyes and mouth and away from the sensitive parts of the body should be used A change of the clothing after each day s operations and the usual practice of washing the face and hands after using these formulations and before eating should be rigidly followed Containers in which they are kept or stored should be plainly labeled and kept out of the reach of children animals and irresponsible persons Unused portions of these preparations and the containers in which they have been mixed should be treated in the same fashion

2 *Emulsions and Liquids* Persons handling BHC emulsions and liquids (especially concentrates) should wear protective clothing and use suitable equipment In formulating and mixing operations the user should combine adequate ventilation with protective equipment and clothing including respirators goggles solvent resistant gloves aprons and boots In field mixing operations he should wear protective gear to prevent excessive skin and respiratory exposure Material splashed or spilled on the clothing on exposed portions of the body or in working areas should be removed immediately When inflammable or volatile solvents are present in the formulation the customary precautions concerning smoking exposed flames and defective electrical equipment should be observed

3 *Sprays and Mists* Persons engaged in extensive spraying or fogging operations should wear respirators which protect the vulnerable parts of the face Protective clothing should be supplemented with greaseless skin lotions or ointments on body surfaces exposed to solvents and other irritants in the formulation The effectiveness of greaseless skin preparations against specific irritants has not been proven in all instances nevertheless some degree of mechanical protection can be expected

Clothing wetted with mists or sprays should be changed immediately and a bath followed by a complete change of clothing is advised after each day s operation Residual liquid in spray tanks and the washings from spray equipment should be emptied in places where they will not drain into wells streams or ponds accessible to human beings animals or fish

Wettable powders and other types of liquid sprays are not recommended for use on very young animals Calves are known to be injured by them and it is believed the young of other animals are highly susceptible

CLINICAL EXPERIENCE

Clinical reports of human poisonings from the use of technical benzene hexachloride or lindane have been comparatively infrequent in the United States Exposure to dusts of the technical mixture in field application and bagging operations has caused irritation of the upper respiratory tract, eyes, and skin, but these reactions were of minor consequence and required medical assistance in only a few instances Similar reactions to powdered forms of the individual alpha, delta and beta isomers have been experienced by workers engaged in their manufacture and formulation Unusual symptoms in two workers engaged in preparing batches of gamma benzene hexachloride for field tests have also been reported It was suggested that these symptoms might have been attributable to absorption of the compound through the skin

Moderate and severe reactions in three field workers applying technical benzene hexachloride in a petroleum solvent base by means of a thermal aerosol generator have also been observed During the period of application, the wind fluctuated both in direction and intensity, enveloping the workers for varying periods of time One worker is stated to have received a maximum exposure of approximately 20 minutes duration Several hours later he became ill, turned pale, and experienced chills and fever During the night he had severe headaches and perspired profusely A lack of normal equilibrium and depth perception was also noted The patient recovered in approximately ten days with no apparent after-effects The other two workers received less severe exposures Although their symptoms were similar to those of the first worker, they were less intense and of shorter duration Severe headaches aching bones and joints, high temperature (104 F), chills, cold sweats, dizziness, and slight loss of equilibrium were experienced Recovery occurred in 24 and 36 hours respectively Illness in all cases was attributed to the inhalation of excessive amounts of the insecticidal smoke, although certain of the symptoms reported are not commonly associated with this type of poisoning.

An attempted suicide involving the ingestion of approximately 30 gm of a 50% wettable powder of benzene hexachloride whose content of the gamma isomer was about 15% has been reported to the Committee The onset and train of symptoms were stated to be similar to those observed in experimental animals

Two suspected, but unconfirmed, fatalities of BHC spray products have been brought to the attention of the Committee In both instances, the insecticide was considered to have played a secondary, though contributory, role in the cause of death A third case, involving the convulsive death of a child living a few yards away from an insecticide mixing plant, was reported in the medical literature Subsequent investigation failed to disclose anything which would support the statement that benzene hexachloride was implicated

In Argentina, occupational dermatitis in workmen exposed to benzene hexachloride is claimed to have reached as high as 25% (Francone, M P , and Chena, W *Semana méd* 55 573 1949) This alarming incidence of reaction was soon decreased when prophylactic measures and proper hygiene were introduced The authors presented 39 cases of dermatitis in persons engaged in grinding and mixing activities, chemical manipulations, and other manufacturing procedures In all cases except one, the workers were in intimate contact with benzene hexachloride Reaction rates varied from single contacts to those involving several months exposure The disorders, in most instances, were of short duration and disappeared without sequels

A fatal case of poisoning caused by the accidental ingestion of a benzene hexachloride solution was reported in Germany (Kwoczek J *Med Monatsschr* 4 25, 1950) Fifteen cubic centimeters of a 30% solution of benzene hexachloride in an unspecified organic solvent was ingested by a five year old girl weighing approximately 50 pounds (25 kg) Shortly after, difficult breathing, cyanosis and clonic tonic convulsions set in, and some of the solution was vomited Three hours later, the child was hospitalized, her stomach was pumped and therapy to restore a failing circulation was vainly instituted Postmortem examination disclosed pulmonary edema, dilation of the heart, fatty infiltration of the liver, and extensive necrosis of blood vessels in the lungs, kidney, and brain

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies A copy of the rules on which the Council bases its action will be sent on application

R T Stormont, M D , *Secretary*

Progesterone-U.S P (See New and Nonofficial Remedies 1951, p 361)

Solution Progesterone 10 cc vials A solution in sesame oil containing 10 and 25 mg of progesterone in each cubic centimeter Preserved with 0 5% chlorobutanol Meyer Chemical Company, Detroit

Pentobarbital Sodium U.S P (See New and Nonofficial Remedies 1951, p 246)

Tablets Pentobarbital Sodium 0 1 gm Physicians' Drug & Supply Company, Philadelphia

Aminophylline-U S P (See New and Nonofficial Remedies 1951, p 297)

Tablets Aminophylline 0 1 gm S J Tutag & Company, Detroit

Diethylstilbestrol U.S P (See New and Nonofficial Remedies 1951, p 340)

Tablets Diethylstilbestrol 5 mg Keith Victor Pharmacal Company, St Louis

Mephenesin (See New and Nonofficial Remedies 1951, p 165)

Tablets Mephenesin 0 5 gm Kremers Urban Company, Milwaukee

Dihydrostreptomycin U.S P (See New and Nonofficial Remedies 1951 p 130)

Solution Dihydrostreptomycin Sulfate 2 cc and 10 cc. vials A solution containing dihydrostreptomycin sulfate equivalent in activity to 1 gm and 5 gm of dihydrostreptomycin base, respectively Buffered with 1 5% sodium citrate Preserved with 0 2% sodium bisulfite Merck & Company, Inc , Rahway, N J

Phenylephrine Hydrochloride U.S.P (See New and Nonofficial Remedies 1951 p 198)

Solution Neo-Synephrine Hydrochloride 0 2% (For parenteral Use) 2 cc ampuls An isotonic solution containing 2 mg of phenylephrine hydrochloride in each cubic centimeter Preserved with 0 1% sodium bisulfite Winthrop-Stearns, Inc , New York

Riboflavin U.S.P (See New and Nonofficial Remedies 1951, p 448)

Tablets Riboflavin 2 0 mg and 5 0 mg Physicians' Drug & Supply Company, Philadelphia

Secobarbital Sodium (See New and Nonofficial Remedies 1951, p 251)

Suppositories Seconal Sodium A suppository containing 32 5 mg of secobarbital sodium Eli Lilly & Company, Indianapolis

COUNCIL ON FOODS AND NUTRITION

The following products, intended for use in low sodium and other therapeutic diets have been accepted as conforming to the rules of the Council Data regarding composition represent the best available information which is based on submitted reports of analyses The Council has requested continuing analytical studies, especially of the sodium content of products intended for use in low sodium diets because of the natural variations in the composition of processed foods

JAMES R WILSON M D , *Secretary*

Reid Murdoch & Company Division of Consolidated Grocers Corporation, Chicago

MONARCH BRAND DIETETIC PACK STRAINED BEETS consist of the vegetable itself packed in water without any added salt.

Analysis (submitted by manufacturer)—Available carbohydrates (total carbohydrate minus crude fiber) 6.69% crude fiber 0.58% fat (ether extract) 0 03% *protein (N × 6 25) 1 24%* ash (minerals) 0 80% sodium 23 mg /100 Gm potassium 193 mg /100 Gm

Calories—0 32 per gram 9 1 per ounce

Use—For use in low sodium and other therapeutic diets

MONARCH BRAND DIETETIC PACK STRAINED CARROTS consist of the vegetable itself packed in water without *any added salt.*

Analysis (submitted by manufacturer)—Available carbohydrates (total carbohydrate minus crude fiber) 5 94% *crude fiber 0 62%* fat (ether extract) 0 05% protein (N × 6.25) 0 70% ash (minerals) 0 74% sodium 33 mg./100 Gm potassium 239 mg /100 Gm

Calories—0 27 per gram 7 7 per ounce

Use—For use in low sodium and other therapeutic diets

MONARCH BRAND DIETETIC PACK STRAINED PEAS consists of the vegetable itself packed in water without any added salt.

Analysis (submitted by manufacturer)—Available carbohydrates (total carbohydrate minus crude fiber) 8 85% crude fiber 0 65% fat (ether extract) 0.29% protein (N × 6.25) 4 01% ash (minerals) 0 66% sodium 21 0 mg /100 Gm potassium 105 mg /100 Gm

Calories—0.54 per gram 15.3 *per ounce*

Use—For use in low sodium and other therapeutic *diets.*

Analysis (submitted by manufacturer)—Available carbohydrates (total carbohydrate minus crude fiber) 3 0% fat (ether extract) 0 4% protein (N × 6.25) 2.7% ash (minerals) 0 8% sodium 2.0 mg./100 Gm., potassium 572 mg /100 *Gm*

Calories—0.26 per gram 7 4 per ounce

Use—For use in low sodium and other therapeutic *diets.*

The following products have been accepted as conforming to the rules of the Council

JAMES R WILSON, M D., *Secretary*

Beech-Nut Packing Company, Canajoharie, N Y

BEECH NUT STRAINED SWEET POTATOES Ingredients Sweet potatoes, salt and water sufficient for preparation

Analysis (submitted by manufacturer)—Total solids 20 58% moisture 79 42% ash 1 08% fat (ether extract) 0.21% protein (N × 6 25) 0 96% crude fiber 0 71% carbohydrate (other than crude fiber) 17 62%

Vitamins and Minerals	Per 100 Gm
Carotene	2.21 mg
Thiamine	24 0 mcg
Riboflavin	32 0 mcg
Nicotinic acid	0 44 mg
Ascorbic acid	17.34 mg
Calcium	26 0 mg
Phosphorus	31 0 mg.
Iron (total)	0 69 mg
Iron (available)	0.32 mg.
Copper	0 11 mg.

Calories—0 76 per gram 21 5 per ounce

Use—For use in the feeding of infants convalescents and others requiring a soft diet

BEECH NUT STRAINED BANANA Ingredients Frozen banana puree banana flakes sugar lemon juice concentrate calciumpectinate and water sufficient for preparation.

Analysis (submitted by manufacturer)—Total solids 26 24% moisture 73 76% ash 0.53% fat (ether extract) 0.22% protein (N × 6 25) 0 73% crude fiber 0.35% carbohydrate other than crude fiber (by difference) 24 41%

Vitamins and Minerals	Per 100 Gm
Thiamine	20 0 mcg
Riboflavin	23 0 mcg
Nicotinic acid	0.39 mg
Ascorbic acid	0 35 mg.
Crude carotene	0 18 mg.
Calcium	*11 0* mg
Phosphorus	23 0 mg.
Iron (total)	0 43 mg.
Iron (available)	0.38 mg
Copper	0 28 mg

Calories—1 05 per gram 29 8 per ounce

Use—For use in the feeding of infants and young children

The Chicago Dietetic Supply House Inc , Chicago

CELLU BRAND DIETETIC PACK TUNA FISH *Ingredients* *Light* meat tuna packed in distilled water

Analysis (submitted by distributor)—Total solids 30 6% moisture 69 4% protein (N × 6 25) 28 3% fat (ether extract) 0 75% *carbohydrates* (by difference) 0 15% sodium 70 mg /100 Gm

Calories—1 22 per gram 34 6 per ounce

Use—A useful adjunct for the planning of low fat low sodium *dietaries.*

CELLU BRAND WHEAT FREE RYE BREAD Ingredients Pure rye flour (bleached) brown cane sugar shortening (100% cottonseed oil hydro*genated*) *salt*, yeast and lactic acid (edible N F 85%)

Analysis (submitted by distributor)—Total *solids* 67 7% moisture 32.3% ash 2 4% fat 4.2% protein (N × 6 25) 6.3%, crude fiber 0 7%, carbohydrates other than crude fiber (by difference) 54 0%

Calories—2.81 per *gram* 79 5 *per ounce*

Use—For use in certain allergy *diets*

CELLU BRAND WHEAT FREE CAKE. Ingredients Mandioca (*sometimes called tapioca*) flour cane sugar shortening (100% cottonseed oil hydrogenated) egg yolks whole eggs salt vanilla (pure bean) and pure almond extract.

Analysis (submitted by distributor)—Total solids 84 0% moisture 16 0% ash 1 7% fat 28.5% *protein (N × 6 25)* 3 4% carbohydrates (by difference) 51 0%

Calories.—4 73 per gram 134 0 per ounce

Use—For *use in certain* allergy diets

Pratt Low Preserving Company, Santa Clara, Calif

PRATT LOW BRAND PINEAPPLE (CHUNKS & TIDBITS) consists of the *fruit* itself packed in juice without any added sugar or salt.

Analysis (submitted by distributor)—Total solids 15 7% moisture 84.3% ash 0 4% fat (ether extract) 0 1% *protein* (N × 6.25) 0 4%, crude fiber 0 4% carbohydrates other than crude fiber (by difference) 14 4%

Calories—0.59 per gram 16 9 per ounce

Use—For use in calory restricted and other therapeutic diets.

FIFTH GENERAL ASSEMBLY OF THE WORLD MEDICAL ASSOCIATION

The fifth general assembly of the World Medical Association was held in Stockholm, Sweden, Sept 15 to 20, under the patronage of the King of Sweden Dr Dag Knutson, president of the Swedish Medical Association, extended a welcome to the members and visitors, the heartiness of which became evident on many occasions as the meeting progressed Friendliness was apparent everywhere, and it, together with the medical and other information available to all, made many new friends for the Swedish medical profession, friends who are hoping for an opportunity to renew their acquaintances soon

The World Medical Association was established four years ago, succeeding the Association Professionnelle Internationale des Médecins An interesting account of the founding of the association appears in the July, 1951, issue of the *World Medical Association Bulletin* Progress has been steady, and during each year there has been seen a degree of accomplishment that indicates the need for such an organization The objectives of the World Medical Association are to promote closer ties among the national medical organizations and among the doctors of the world, to maintain the honor and protect the interests of the medical profession, to study and report on the professional problems that confront the medical profession in the different countries, to organize an exchange of information on matters of interest to the medical profession, to present the views of the medical profession to the World Health Organization, UNESCO, and other appropriate bodies, to assist all peoples of the world to attain the highest possible level of health, and to promote world peace At the fifth assembly many problems of common interest were discussed, and participants left each meeting with a broader appreciation of the health problems of other nations, the work of the medical profession in these nations, and the need for further action A brief abstract of the proceedings of the meeting will appear in an early issue of THE JOURNAL

Retiring president Elmer L Henderson, of the United States, in his address mentioned the goal the World Medical Association could seek in membership—representation from 60 nations and 500,000 physicians throughout the world New members at the assembly were the medical associations of Thailand, Japan and Western Germany The medical associations of Haiti and the Republic of South Korea were admitted to membership as the meeting progressed Some of the achievements reported by Dr Henderson for the last year included the development of relations with the World Health Organization and other international groups in the field of medicine and health, the planning of an international conference on questions of professional and technical education, the consideration of freer flow of essential medical supplies between countries, encouragement of the international use of nonproprietary names, the study of relief of medical and religious personnel held with prisoners of war, and the identification of medical personnel Among the reports and other literature received by members of the association are copies of its studies, for example, on postgraduate medical education and specialist training, and the *World Medical Association Bulletin*, which now has a circulation of 10,000 and is self-supporting This journal contains articles in the three official languages of the association, English, French, and Spanish

One of the discussion-provoking reports presented to the assembly described medical services in Australia This report pointed out that the medical profession of Australia had steadfastly refused to cooperate with the previous government because of its declared intention to nationalize medical services So successful was this opposition that the government was unable to implement such plans The governments changed and the minister for health of the new government said in part "Our policy aims to improve the quality of medical service in its essential factors by stimulating individual and community effort It makes the individual a partner of the Government, not its servant One outstanding fact that has emerged from various schemes of socialization of medicine is that Government control of medical treatment, especially the handing-out of treatment for nothing, does not improve the standards of medical treatment or of national or individual health The most that Government control has been able to do has been to retain the status quo ante In most cases, however, there has come inevitably a steady deterioration of the morale of the people, loss of skill of the doctors, especially general practitioners, through the enormous wastage of time in filling in forms and consequent degeneration of the health of the patients

"Experience of the rest of the world in regard to health schemes indicates that the most likely system to satisfy all these requirements (essential factors for success of a health scheme) is one of voluntary insurance Voluntary insurance will prove as valuable against unpredictable sickness as it has with life, shipwreck, theft and other risks " When these views were expressed at the general assembly meeting they were roundly supported as general principles worthy of the attention of other government officials There seemed to be no doubt about the desire of those at the assembly to maintain freedom in medical care for the patient and physician, so that the best possible medical care could be provided without the stultifying influence of government domination

One aspect of this meeting that was commented on repeatedly by visitors who were seeing for the first time the delegates of the World Medical Association in action was the way in which representatives of various countries, often with different practices and medical problems, could sit together and discuss so much in common, with so little difference of opinion These newly initiated visitors were impressed with the thought that when questions of health are involved the interests of physicians are basically the same the world over, and when they are given the opportunity to meet and freely exchange information physicians can contribute much for the good of all countries In the World Medical Association this is possible because the association is free from government control It is supported by national medical associations such as the American Medical Association, and is not governed by policies defined by governments

Dr Elmer Henderson retired as president of the World Medical Association and was succeeded by Dr Dag Knutson of Sweden The president-elect chosen for the coming year is Prof G Krimpas of Greece, where the assembly will be held in 1952 In 1953 the assembly will meet in Holland, and in 1954 in Italy Three members were elected to the council because of the expiration of terms of office Dr Pierre Glorieux of Belgium was elected to succeed himself, and Drs Elmer L Henderson of the United States and L R Mallen of Australia were elected to fill the other vacancies Dr T C Routley, Secretary of the Canadian Medical Association, who had served as chairman of the council for four years, was given a warm vote of thanks for his untiring efforts and able leadership His work and that of the secretary-general, Dr Louis H Bauer, president-elect of the American Medical Association, and of the other officers and delegates have meant much in the development of the progress accomplished by the World Medical Association The members also have made an immeasurable contribution by participating actively and with enthusiasm Dr Knutson in his presidential address said "The W M A embodies ideas of high quality well worth being promoted The doctors of the world should be proud of their organization They should make it through their work ever more worthy of their support and their pride Ultimately this would bring to mankind if not health and happiness at least a better starting point from which one and as a possible consequence the other can be attained And that is what we the doctors of the world must hope for and work for That is in fact, what we have always worked for in our own field, on the whole true to principles the wisdom and humanity of which has not been doubted for some two thousand years " Evidence of this unity of interest was obvious as one looked at the assembly meeting in Stockholm's beautiful parliament building, where simultaneous translations were being made for those not conversant with the language of the speaker and where this sign of modern technical progress seemed to blend so well with the seriousness of the subjects under discussion Additional evidence of the common interests of physicians was seen at the social gatherings, where men and women from all nations met with understanding and enjoyment At the meetings there were delegates and observers from more than 30 countries At the banquet there were more than 300 persons present to enjoy the hospitality of the Swedish Medical Association From the United States alone there were more than 40 observers in addition to officers delegates, and alternate delegates, and there were observers from more than 20 other national and international organizations It was inevitable that the fifth general assembly and the second medical editors conference, which followed the conclusion of the work of the assembly, should be successful The planning, the participation, and the setting were overwhelming factors in favor of success

It may seem like a long time before the sixth general assembly convenes in Greece in 1952, but time moves surprisingly quickly, and it is not too early for physicians to plan on attending this meeting They can be assured of a warm welcome from the physicians in that country

RED FEATHER CAMPAIGNS

Within the next two weeks, United Red Feather campaigns will be conducted in more than 1 500 communities throughout the nation In a statement appearing elsewhere in this issue (p 579), Dr John W Cline, President of the American Medical Association, points out that this year the contributed funds will sustain the United Defense Fund as well as numerous community health, welfare, and recreational activities The United Defense Fund performs services of great importance, caring for the military through the United Service Organizations, assisting civilians in densely populated defense areas, establishing community projects through the United Community Defense Services, and providing clothing, blankets, and sewing material to the Koreans through the American Relief to Korea Through the individual Community Chests, the Red Feather campaigns provide assistance for voluntary hospitals, clinics, nursing services, and other health and welfare agencies for citizens in lower income brackets The extension of medical and health services to the needy by voluntary means deserves the whole-hearted support of the medical profession

NEARLY A MILLION TRAFFIC DEATHS

According to figures released at the end of July, 1951, by the National Safety Council, 983,000 lives have been lost in traffic deaths since the advent of the automobile little more than 50 years ago The council estimates that the 1,000,000th victim will be killed during the latter half of December of this year and that if the present rate of traffic deaths continues, a second million will be killed within 30 years In the hope of postponing the estimated date of the 1,000,000th fatality, the council is undertaking an extensive campaign to focus public attention on the rising toll of traffic deaths Members of the medical profession will be anxious to support efforts directed toward reducing automobile accidents which now rank as the sixth major cause of death in the nation The individual physician can cooperate with the National Safety Council by discouraging driving in patients with health impairments known to increase the risk of accidents, by publicizing the role of physical and mental disturbances in accident causation and by bringing home to the proper authorities the necessity for periodic mental and physical examinations for every driver

ARTIFACTS IN THE ESTIMATION OF PROTEIN-BOUND IODINE

In the quantitative estimation of protein-bound iodine, the proteins of the serum are precipitated and then washed free of inorganic iodine Thus the iodine that is finally estimated, the protein-bound iodine, is essentially iodine of the thyroid hormone Under ordinary circumstances protein-bound iodine is regarded as a reliable index of thyroid function

During the course of various diagnostic and therapeutic procedures, organic compounds containing large amounts of iodine are used Some of these foreign substances are precipitated with the protein and are not removed by repeated washings, with resulting erroneously high values for the protein-bound iodine of serum Man and Peters[1] studied the effect of three different radiopaque dyes used for roentgen visualization The substances studied were iodoalphionic acid (priodax®), iodopyracet (diodrast®), and iodized oil (lipiodol®) Of the seven subjects who received the first dye, none having demonstrable liver, kidney, thyroid, or gallbladder disorders, in only one did the protein-bound iodine values fall to pretreatment levels within 10 weeks after the administration of the iodine-containing compound These investigators suggest that it would not be advisable to determine the protein-bound iodine of the serum in a patient less than 12 weeks after the administration of iodoalphionic acid, in addition, the values should be checked by repeated analyses two weeks later On the other hand, the elimination of iodopyracet is rapid, when normal kidney function is present, reliable values for the protein-bound iodine may be obtained after a period of two weeks Iodized oil is excreted at a variable rate and slowly, indications are that deposits of the dye discharge iodine slowly into the blood stream for a long period of time and that part of this iodine is precipitated with the protein

In cardiac conditions in which detection of derangements of thyroid activity is important, Meyers and Man[2] found that the protein-bound iodine values were low when mercurial diuretics had been given After intramuscular administration of meralluride (mercuhydrin®) there was a lowering of the protein-bound iodine for at least 24 hours, depending on the rate of excretion of the mercury These investigators suggested that the estimation of protein-bound iodine should be delayed for at least 48 hours after administration of meralluride When the excretion of mercury is delayed, a longer period must be allowed to elapse The falsely low values for protein-bound iodine are believed due to the formation of insoluble mercuric iodide or iodate during the process of digestion, these latter substances not being distillable as is iodine Other mercurial diuretics were not studied, though it is believed they should produce similar depressions on the level of protein-bound iodine

Under ordinary circumstances the protein-bound iodine of the serum is a reliable index of activity of the thyroid gland However, factors that are not related to functional activity of the thyroid gland can influence the results of this determination Probably the skepticism of many clinicians regarding the ability of the laboratory to do this difficult test arises because of the inconclusive results obtained, possibly owing to factors such as are discussed above

ONCOLYTIC ACTION OF EPINEPHRINE

In 1948 it was shown by Lewis[1] and her associates of Wistar Institute, Philadelphia, that, when tissues from sarcoma-immune rats are minced with sarcoma grafts, the only organ that inhibits growth of the graft is the adrenal gland Subsequent tests with the adrenals of normal rats showed a similar inhibition The conclusion was drawn that graft inhibition was due to the action of one or more of the normal adrenal hormones Tests were therefore made of the oncolytic action of epinephrine[2]

Inbred albino rats and native tumors that were 100% transplantable were used, with four types of procedure 1 Implantation of minced tissue to which epinephrine had been added The epinephrine used was in the form of a sterile solution containing 1 mg of epinephrine per cubic centimeter of isotonic sodium chloride solution, to which 0 1% sodium bisulfate and 0 5% chlorobutanol were added as preservatives 2 Intratumor injection of epinephrine 3 Local injection around small tumors growing in susceptible rats 4 Injections of epinephrine into local subcutaneous tissues two hours to 10 days prior to implantation of the graft Control tests were made with isotonic sodium chloride solution

The tests showed that the addition of epinephrine to minced sarcoma tissue inhibits its growth in 52% of the cases Similar results were obtained from intratumoral or peritumoral injections of epinephrine The most suggestive results, however, followed injection of epinephrine into subcutaneous tissues prior to implantation of the graft The grafts failed to grow in 21 of the 34 rats that received grafts two to three hours after local epinephrine injection The grafts grew in five out of 13 rats after a lapse of three days, in six out of nine rats after a lapse of seven days, and in all rats after a lapse of 10 days Lewis concluded from these tests that the tumor inhibitory action of epinephrine is due to local damage to vascularization, which is followed by tumor adsorption

In all rats in which tumors were absorbed or failed to grow, viable grafts were implanted on the opposite side of the body three weeks after the first implantation Of the 61 rats thus tested, 40 showed effective resistance to growth of the second graft The initial epinephrine sarcoma injection thus functioned as an effective prophylactic sarcoma vaccine

ORGANIZATION SECTION

DR. CLINE ON UNITED DEFENSE FUND AND RED FEATHER CAMPAIGN

The United Defense Fund fills a great need during this period of mobilization and military activity in Korea It is sustained by contributions made to the United Red Feather Campaigns The latter perform essential functions in the normal civilian life of our communities These worthy projects depend upon money raised during the Fall campaigns They deserve the wholehearted support of physicians everywhere

More and more of our colleagues are being called into the Armed Forces Our contributions will provide important services for them and at the same time assist us at home by extending the activities of voluntary hospitals clinics, nursing services and other health agencies for citizens in the lower income groups

'The medical profession has always advocated extension of medical and health services to these people by voluntary means Private support will eliminate the hazard of governmental participation and control

"The U D F Agencies are badly needed to care for the military through the U S O to assist civilians in densely populated defense areas to establish community projects through the U C D S and to provide clothing for the Koreans through A R K These are splendid activities of great importance at the present time

This year, it is possible for us to subscribe to both the Red Feather home activities and the U D F National Service Programs at one time Let us get behind the Red Feather Campaign this year and make it a great success We can render great service to our own communities and our Armed Services by so doing and can avoid the danger of government taking over these activities'

John W Cline M D President,
American Medical Association

MEETINGS OF OFFICIAL BODIES

The Board of Trustees Room, on the ninth floor of the Association s building will be the meeting place of various official bodies during October and November

The Public Relations Advisory Committee, composed of executives of state medical associations which was recently appointed to assist the American Medical Association in handling some of its public relations problems will have a two day meeting on Oct 4 and 5

The Committee on Constitution and By Laws established by the House of Delegates will meet on Oct 8, for the purpose of carrying out the mandates of the House with respect to proposed amendments to the Constitution and By Laws for action at the Clinical Session in Los Angeles in December One of the tasks involved is the provision of a single membership classification

Members of the mission are Dr Gordon Kenneth Moe, Syracuse, N Y, Dr Hugo Theorell, Stockholm, Sweden Dr Paul Klemperer, New York, Dr Erik Warburg, Copenhagen, Denmark, Dr Samuel Z. Levine, New York, Dr Carl Semb, Oslo, Norway, Dr Leo M Davidoff, New York, Dr H Osmond Clarke, London, Dr Leo G Rigler, Minneapolis, Dr Lucien E Morris, Iowa City, Dr Edward Grzegorzewski, Geneva, Switzerland, Dr Karl Evang, Oslo, Norway, Dr John E Gordon, Boston and Prof Richard G Tyler, Seattle

Marriage Rates and World War II.—The soaring marriage rates which followed World War II throughout much of the world have now declined to approximately prewar levels, according to the Metropolitan Life Insurance Company s statisticians In reporting on the extent to which World War II has influenced marriage rates during the past decade, the statisticians note that the changes varied from country to country, with the most pronounced effects felt in the occupied nations and in those belligerents actively engaged in hostilities In the neutrals, on the other hand, there was relatively little change From 1939 to 1942 the English speaking nations experienced a high point in the number of marriages which was followed by a decline for two or three years Termination of the conflict, however brought a new high, the peak occurring in 1945 in the British Isles and the following year in the United States, Canada, Australia and New Zealand In this country the rate of 16 2 marriages per 1,000 population attained in 1946 was not only the highest in nation s history, but also higher than that of any other country in the postwar period The rate of marriages fell off greatly in the occupied countries of Europe during the later years of the war In some as Belgium, France, Italy Luxembourg, and Romania, it was continually below the prewar level with 5 marriages per 1,000 population not uncommon However, in almost every case the end of the struggle brought a sharp upturn, and in some instances, especially France, the number of marriages remains much higher today than in the prewar period It is likely that the decline in marriage rates will continue during the next few years, according to the statisticians, because we are entering the period in which effects of the low birth rate during the depression years will be shown in fewer people at taining marriageable age

International Tuberculosis Campaign —Since the end of World War II the International Tuberculosis Campaign has directed and coordinated in 23 countries the tuberculin testing of 36 million children and adolescents and the vaccination of 16 million of that number with BCG (Bacillus Calmette Guérin) Further plans are now in progress for the continuation of the campaign in the participating countries and for its extension to other lands and peoples Started at the close of the war by the Danish Red Cross Society, which introduced mass BCG vaccination in several European countries as an emergency measure against tuberculosis the campaign was carried out until July 1 through the united effort and support of the Scandinavian voluntary societies and the United Nations International Children s Emergency Fund with the cooperation of the World Health Organization It is being continued by UNICEF and WHO which established in February, 1949, a Tuberculosis Research Office in Copenhagen, Denmark, to evaluate the results of the campaign The Tuberculosis Research Office has cooperated with certain countries in a long range evaluation program Punch card copies of all vaccination records including both the tested and the vaccinated are made to form a national register which would permit direct matching of current tuberculosis morbidity and mortality among the vaccinated group as against those occurring among the natural reactors to tuberculin, or the expected trends in the general population based on pre vaccination experiences Denmark and Finland have begun evaluation studies

Prevalence of Poliomyelitis.—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States in the weeks ended as indicated

FOREIGN

Plague Epidemic Fading in Yemen.—A preliminary survey of over 60 villages in the Saada region of Khawlan a province of Yemen on the Saudi Arabian border, has revealed only 12 cases of bubonic plague and one of pneumonic plague The report came from Dr Hafez Amin Bey World Health Organization medical consultant who was sent to investigate a reported epidemic of plague on the request of the government of Yemen In the opinion of Dr Amin the epidemic which began around March 1 is now fading It had stopped in some villages even before the arrival of the WHO team There were no traces of it in Yemenite ports and authorities reported that all rats caught in Aden on Yemenite ships were completely free from the disease As a result of his investigations Dr Amin in consultation with the government health authorities at Aden has worked out a plan for surveillance of the infected area and full reporting of new cases He will continue his own work in the field, as well as analyzing and coordinating the reports of teams in the mountains

LATIN AMERICA

Yellow Fever Outbreak in Costa Rica—Dr Fred L Soper, director of the Pan American Sanitary Bureau, Regional Office of the World Health Organization Washington, D C, went to Costa Rica in mid September to consult with public health officials regarding the outbreak of yellow fever in jungle areas of that Central American republic The Costa Rican Government by mid September had reported 25 cases confirmed by laboratory analysis, and 24 deaths since the outbreak occurred three months previously The cases are located in jungle areas of three provinces Alajuela, Heredia and Limon Up to Sept 6 Costa Rican public health authorities had vaccinated some 50,000 persons in the infected and adjacent districts According to official reports, the urban vector of yellow fever, the Aedes aegypti mosquito, is no longer found anywhere in the republic It is transmitted, however, in jungle areas It has been found impossible to eliminate yellow fever from such jungle areas, particularly because monkeys are also infected, vaccination is the only adequate control measure The present outbreak indicates the presence of the virus in the jungle areas of this hemisphere Cases were reported in Panama some months prior to the current outbreak in Costa Rica, just south of the border of the latter republic At that time the Costa Rican government initiated its present vaccination campaign with the assistance of the PASB The presence of the virus in certain jungle spots of southeastern Mexico (State of Chiapas) recently has been detected through laboratory studies of monkeys blood serum

The current outbreak emphasizes the need for continuing without interruption the continent-wide program for the complete eradication of the Aedes aegypti, which still occurs in certain urban areas as far north as the southern part of the United States This program, approved by the Pan American Sanitary Organization, is being carried on by the Latin American governments, with the assistance of PASB and other international organizations, in order to prevent the spread of the disease to cities, towns, and rural communities, where it might assume epidemic proportions

CORRECTION

Orthopedics and Industry.—In the Correspondence section of *The Journal*, Sept 15, page 275, the following material should be substituted for the first four lines of the next to the last paragraph of the letter by Dr M H Manson

"The booklet referred to in Dr Billig s recent article was a brochure entitled Thirty Days Hath September,' which deals specifically with menstruation In June, 1945 at a Bell System Medical Directors Conference, the contents of this brochure were discussed, also the then existing reports on the Billig exercises "

Day, Charles Alvin, Ashley, Ohio, Ohio Medical University, Columbus 1904, died in Galion June 1, aged 81, of cerebral thrombosis and pneumonia

Durham, Clarence Judson ⊕ Muskegon, Mich , Chicago Homeopathic Medical College, 1902 for many years affiliated with Mercy and Hackley hospitals, where he died July 10, aged 74 of uremia

Ellis, Charles A , Denver, Colo , Kentucky School of Medicine, Louisville, 1898 died July 8, aged 89, of a cardiac infarct

Estes, Neal D., Tulsa Okla , (licensed in Arkansas in 1903), served during the Spanish American War, died in the Veterans Administration Hospital, Muskegee, June 10, aged 73 of cerebrovascular accident.

Fishburne, Skottowe Bellinger, Columbia, S C , Medical College of the State of South Carolina, Charleston, 1900, member of the American Medical Association for many years an examiner for the Veterans Administration, served during World War I, formerly city health officer and county physician for many years a trustee at his alma mater died in the Veterans Administration Hospital July 7, aged 76, of hypertensive heart disease

Friesen, Henry J ⊕ Glendale Calif , Northwestern University Medical School, Chicago, 1910 specialist certified by the American Board of Otolaryngology, fellow of the American College of Surgeons, past president of the Glendale Branch of the Los Angeles County Medical Society, on the staffs of Behrens Memorial Hospital and Glendale Sanitarium and Hospital, died July 6, aged 71, of ventricular fibrillation

Frye, Oscar Blaine, Grand Rapids, Mich Detroit College of Medicine, 1907, at one time city bacteriologist and assistant city health officer, died July 9, aged 65, of coronary thrombosis

Garrett, John Abner, Meigs, Ga , Atlanta College of Physicians and Surgeons, 1906 member of the American Medical Association, died June 5, aged 71, of coronary occlusion

Gilbert, Frederick James Simpson, Columbia, S C Medical Department of Tulane University of Louisiana, New Orleans, 1891, died in Providence Hospital July 11, aged 87, of bronchopneumonia

Gribble, Le Grande G., Pomeroy, Ohio Medical College of Ohio, Cincinnati 1896 member of the American Medical Association died June 2, aged 76, of complications as the result of a fall

Grimes, William Lawrence, Winston Salem, N C Johns Hopkins University School of Medicine, Baltimore 1910 member of the American Medical Association consulting surgeon at City Memorial Hospital died July 9 aged 66, of bronchopneumonia

Grove, Charles Edward, Spokane Wash Hahnemann Medical College and Hospital of Philadelphia 1889 member of the American Medical Association served on the staff of St Luke s Hospital died in Sacred Heart Hospital July 10 aged 87, of cerebral thrombosis

Hadden, Claude Eugene, Indianapolis, Indiana University School of Medicine Indianapolis, 1925, member of the American Medical Association at one time deputy coroner of Marion County served as physician to the State Athletic Commission, affiliated with Methodist Hospital and St Vincent s Hospital where he died June 20, aged 54, of coronary occlusion

Hall, Price Barringer ⊕ Columbia, S C , North Carolina Medical College, Davidson, 1903 served during World War I, for many years affiliated with the Veterans Administration regional office died in Alachua General Hospital Gainesville Fla , June 29, aged 71, of coronary thrombosis

Harper, Daniel Luther, Meridian Miss Medical College of Alabama, Mobile, 1906, died in Riley's Hospital June 29, aged 69, of arteriosclerosis and myocardial failure

Hellebrandt, Frank J , St Petersburg Fla College of Physicians and Surgeons of Chicago, 1895, died in the Medical College of Virginia Hospital, Richmond, July 8, aged 81, of coronary occlusion

Hotz, John William ⊕ St Louis, St Louis University School of Medicine, 1925, fellow of the American College of Surgeons, instructor in surgery at his alma mater served during World War I surgeon Deaconess Hospital and St Mary s Group of Hospitals died in Deaconess Hospital June 26 aged 51, of pulmonary infarct

Howe, Charles Lester, Mercer, Pa , Kentucky School of Medicine, Louisville, 1893, member of the American Medical Association, on the staff of the Mercer Cottage Hospital vice president of the board of trustees of the Farmers National Bank, died July 7, aged 85, of myocardial degeneration

Judy, William John ⊕ Parkersburg W Va , Medical College of Virginia, Richmond, 1904 also a Baptist minister, honorary member and formerly vice president of the Parkersburg Academy of Medicine, died July 6 aged 73 of coronary thrombosis

Karr, Herbert Stanley ⊕ Detroit, Detroit College of Medicine, 1908, affiliated with Harper Hospital and the Florence Crittenton Hospital, where he died June 12, aged 68 of carcinoma

Knight, J Oliver ⊕ Louisville Ky Louisville (Ky) Medical College 1907 affiliated with Kentucky Baptist and Deaconess hospitals and Norton Memorial Infirmary, an honorary member of the staff of St Anthony Hospital, medical examiner for Selective Service during World Wars I and II died June 23, aged 66, of cardiovascular disease and diabetes mellitus

Krueger, William F., Milwaukee, Marquette University School of Medicine, Milwaukee 1913, member of the American Medical Association died in St Joseph s Hospital June 6, aged 72, of carcinoma of the stomach

Lee, Allen Hays, Terre Haute, Ind Indiana University School of Medicine Indianapolis 1926 member of the American Medical Association on the staff of Union and St Anthony s hospitals died in Flower and Fifth Avenue Hospitals in New York July 1 aged 56 of hypertension

Levda, Paul Leighton, Englewood Colo Jefferson Medical College of Philadelphia 1909 at one time practiced in Frederick, where he was mayor and president of the school board veteran of the Spanish American War and World War I died in the Veterans Administration Hospital, Fort Logan July 6 aged 71, of cerebral hemorrhage

McCaskill, Melvin Edgar, Little Rock, Ark , St Louis University School of Medicine, 1905 associate professor of gynecology at University of Arkansas School of Medicine, member of the American Medical Association, past president of the Arkansas Medical Society, the Pulaski County Medical Society, and the Arkansas State Board of Health, affiliated with St Vincent Infirmary and Arkansas Baptist Hospital, died July 9, aged 69, of cerebral hemorrhage and peptic ulcer

Mahady, Stephen Augustus, Utica, N Y Baltimore Medical College, 1902, member of the American Medical Association, served during World War I at one time practiced in Waterville, N Y , where he was county coroner formerly deputy health officer, on the staff of St Elizabeth Hospital, supervisor of medical inspection in Utica schools, died June 19, aged 73, of coronary thrombosis

Marsh, Francis Aloysius, Salt Lake City St Louis University School of Medicine, 1927, served during World War I, formerly affiliated with the Indian Service, died July 19, aged 52

Mayer, Edward Anton, Kaukauna, Wis College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1904, also a graduate in pharmacy formerly city physician, died May 21, aged 78, of carcinoma

Moore, William Banner, Rural Retreat, Va , College of Physicians and Surgeons, Baltimore, 1893, died May 30, aged 81, of cerebral hemorrhage

Newton, Ralph Waldo ⊕ Major United States Army, retired, Santa Rosa, Calif , New York University Medical College, New York, 1898, member of the Massachusetts Medical Society, served in the Philippine Islands from 1900 to 1905 and again from 1912 to 1915 while in the Medical Reserve Corps of the Army, entered the Medical Corps of the regular Army in 1918, retired for disability, May 31, 1933, died July 21, aged 76, of coronary thrombosis

O'Brien, David William, Fishersville, Va , Jefferson Medical College of Philadelphia, 1925, died in the Kings Daughters Hospital, Staunton, June 23, aged 53, of coronary thrombosis

Parham, LeRoy Glenn ⊕ Atlanta, Ga , Emory University School of Medicine, 1915, served during World War I, died July 12, aged 62, of coronary thrombosis

Parrish, Isaac Newton, Freeman, Mo (licensed in Missouri in 1901) member of the American Medical Association, served during World War I, died July 1, aged 77, of pulmonary thrombosis

Perkins, Robert Browning, Houston, Texas, Washington University School of Medicine, St. Louis, 1944, member of the American Medical Association served during World War II, died in San Antonio July 3, aged 31, of injuries received in an automobile accident.

Pierce, William, Chicago, Washington University School of Medicine, St Louis 1903, died July 6, aged 77, of acute coronary thrombosis

Pringle, Jesse Alva, Oconomowoc, Wis State University of Iowa College of Medicine, Iowa City, 1901 member of the Iowa State Medical Society and the American Medical Association, died recently, aged 75, of cerebral hemorrhage hypertension, and coronary heart disease

Redden, James Elmer, Casa Grande, Ariz., College of Physicians and Surgeons, Little Rock 1908 city health officer district physician for the Southern Pacific Railroad, affiliated with Norman Hospital where he died July 6, aged 66, of coronary thrombosis

Reed, Palmer Harding ⊕ El Paso, Texas, Tulane University of of Louisiana School of Medicine, New Orleans, 1928 member of the American College of Chest Physicians formerly practiced in Paducah Ky where he was past president of the McCracken County Medical Society died June 30, aged 46, of bronchial asthma and congestive heart failure

Repper, Paul Aloysius ⊕ McKeesport, Pa , Loyola University School of Medicine, Chicago, 1927 past president of the McKeesport Academy of Medicine affiliated with McKeesport Hospital, died July 2 aged 55, of coronary occlusion

Richardson, Ira Walter ⊕ Wakefield Mass , Harvard Medical School, Boston, 1915, served in France during World War I, since 1944 medical examiner of the Third Middlesex District, past president of the Middlesex East District Medical Society, school physician chief of medical staff, Melrose (Mass) Hospital, where he died July 1, aged 63, of cerebral hemorrhage

Roberts, James Stanton, Chester, N H Harvard Medical School, Boston, 1893 died July 11, aged 79, of metastatic carcinoma

Rust, Aloney Lyman, Malone, N Y , Syracuse University College of Medicine, 1900, on the staff of the Alice Hyde Memorial Hospital, died July 1, aged 74 of arteriosclerotic heart disease and diabetes mellitus

Ryan, Ralph R , Scarsdale, N Y , Columbia University College of Physicians and Surgeons, New York 1905, member of the American Medical Association served as health officer, a founder and director of Scarsdale National Bank, died in Santa Monica, Calif , July 1, aged 71, of heart disease

Sauer, William Walter, Marietta, Ohio, Miami Medical College, Cincinnati, 1905, life member of the American Academy of Ophthalmology and Otolaryngology, specialist certified by the American Board of Otolaryngology, on the staff of Marietta Memorial Hospital, died June 30, aged 68, of cerebral embolism

Schnipelsky, Louis Arthur ⊕ Bath, N Y University of Bristol Faculty of Medicine, England, 1936, affiliated with the Veterans Administration Center, died in Bath Memorial Hospital recently, aged 44, of myocardial infarction

Schweitzer, Ada Estelle ⊕ Indianapolis, Indiana Medical College, School of Medicine of Purdue University Indianapolis, 1907, an Associate Fellow of the American Medical Association, for many years director of the division of infant and child hygiene of the state board of health, member of the American Academy of Pediatrics fellow of the American College of Physicians, died July 2, aged 78, of cerebral hemorrhage

Sheeran, James Douglas, Albany, N Y , Long Island College of Medicine, Brooklyn, 1936, served during World War II, member of the American Medical Association, affiliated with the Veterans Administration, died in the Veterans Administration Hospital June 18, aged 42, of heart disease

Sherman, Morris Mortimer, Brooklyn, Long Island College Hospital, Brooklyn, 1911, specialist certified by the American Board of Psychiatry and Neurology, member of the American Psychiatric Association chief alienist of the Kings County Hospital in Brooklyn, Queens General Hospital in Jamaica and Richmond Hospital in Staten Island for many years, on the staff of Unity Hospital, died June 21, aged 62, of carcinoma of the bladder

Stenbuck, Joseph Benjamin ⊕ New York, Columbia University College of Physicians and Surgeons, New York, 1917, specialist certified by the American Board of Surgery, fellow of the American College of Surgeons, served overseas during World Wars I and II, affiliated with Harlem and Sydenham hospitals, died June 1, aged 59, of coronary thrombosis

Stowers, Guy A , Gilman City, Mo , Kansas City (Mo) Medical College, 1900, died in the Bethany (Mo) Hospital June 11, aged 77, of injuries received in an automobile accident

Stratton, Forrest LeRoy ⊕ Kilgore, Texas, University of Oklahoma School of Medicine, Oklahoma City, 1926, died recently, aged 47, of acute hepatitis and cirrhosis of the liver

Strayer, John Curvin ⊕ Buchanan Mich , University of Michigan Department of Medicine and Surgery, Ann Arbor, 1912, past president of the Berrien County Medical Society, formerly village president and mayor president and for many years a member of the board of education, on the staff of Pawating Hospital in Niles and Memorial Hospital in South Bend, Ind , died June 10, aged 64, of subarachnoid hemorrhage

Stuhr, Walter Anthony ⊕ Chicago, Northwestern University Medical School, Chicago, 1910, served on the staff of Grant Hospital, died in Council Bluffs, Iowa, June 5, aged 70, of acute myocardial infarction

Summers, Porter Whitefield, Chicago, Bennett Medical College, Chicago, 1912, died in St Elizabeth s Hospital June 8, aged 68, of arteriosclerotic heart disease

Threlkeld, Richard L., Denver; Louisville (Ky) Medical College, 1902, member of the American Medical Association, died July 5, aged 74, of acute coronary occlusion

Tracy, Robert Graham, New Haven, Conn , Yale University School of Medicine, New Haven, 1900, affiliated with Grace Hospital, died July 7, aged 73, of anuria

Viley, Leland Peak, Kansas City, Mo , Washington University School of Medicine, St Louis, 1908, member of the American Medical Association, died in the Neurological Hospital June 3, aged 68, of terminal pneumonia

Walker, Charles Bickley, Ripley, Tenn , Vanderbilt University School of Medicine, Nashville, 1886, died June 12, aged 92

Walker, Moses Rollin ⊕ Oakland, Calif , College of Physicians and Surgeons, San Francisco, 1901, an Associate Fellow of the American Medical Association and in 1915 and 1921 a member of its House of Delegates, formerly practiced in Reno, Nev , where he was medical supervisor for the public schools, president of the board of education, and for one term city health officer; a member and past president of the Nevada State Medical Association, died June 10, aged 88, of intestinal obstruction

Warren, Robert Emmett, Nashville, Tenn , (licensed in Tennessee in 1910), member of the American Medical Association, died July 15, aged 64

Weinstock, Michael Benjamin ⊕ Newark, N J , University and Bellevue Hospital Medical College, New York, 1917, fellow of the American College of Surgeons, served during World Wars I and II, on the staffs of City Hospital and the American Legion Memorial Hospital died June 28, aged 56, of lobar pneumonia and carcinoma of the lung

Welfer, Clarence Robinson ⊕ Los Angeles, University of Pittsburgh School of Medicine, 1919, died recently, aged 56, of coronary occlusion

Wheeler, William Martin, Sedalia, Mo , Kentucky School of Medicine, Louisville, 1893, member of the American Medical Association, served overseas during World War I, county coroner for one term, shop surgeon for the Missouri Pacific Railroad, died in Missouri Pacific Hospital, St Louis, July 22, aged 81, of carcinoma of the throat

Wood, Dorothy Augusta ⊕ San Mateo, Calif , Stanford University School of Medicine, San Francisco, 1919, formerly on the faculty of the University of California Medical School, specialist certified by the American Board of Anesthesiology, member of the American Society of Anesthesiologists, on the staff of Mills Memorial Hospital, where she died June 8, aged 57, of coronary artery disease

Yount, John Henry, Chicago, Vanderbilt University School of Medicine, Nashville, Tenn , 1906, died in Wesley Memorial Hospital June 6, aged 67, of peritonitis and uremia

DIED WHILE IN MILITARY SERVICE

Hardgrave, George Louis Jr , Clarksville, Ark , born in Clarksville May 7, 1916, University of Arkansas School of Medicine, Little Rock, 1942, interned at St Luke's Hospital in Jacksonville, Fla then was appointed assistant surgeon with the rank of lieutenant (jg) in the medical corps of the U S Naval Reserve, attended the Naval School of Aviation Medicine at the Naval Air Station, Pensacola, Fla , and on completion of this course was designated a flight surgeon, during World War II served at various naval air stations in the United States and on board the *USS Blakly* (DD 150), released from active duty on July 11, 1946, at the outbreak of the Korean action he volunteered and was ordered to duty Nov 8, 1950, attended a refresher course in Aviation Medicine at the Naval Air Station, Pensacola, and was subsequently assigned to Patrol Squadron Forty two for duty involving flying as a flight surgeon killed in a plane crash while attempting a night single engine landing at an airfield in Japan April 22, aged 34

GOVERNMENT SERVICES

SELECTIVE SERVICE

The Selective Service System—The following information was received from the National Advisory Committee to the Selective Service System, 1712 G Street N W, Washington, D C, on Sept 14 1951

RELEASE FROM SERVICE

The Department of the Navy is using the following policy in regard to release from service of physicians and dentists (former registrants and reservists)

	Months
Priority 1	24
Priority 2	12 24
Priority 3	24
Priority 4	
(12 months during World War II)	12 17
(Less than 12 months during World War II)	12 24

The Department of the Army is operating, at present, on the following program

Any physician or dentist who served 12 months during World War II becomes eligible for release after 17 months of current service except those called in Organized Reserve Units who will serve the full 24 months

The Department of the Air Force is operating, at present, on the following program

Any physician dentist or veterinarian may request release after 21 months of service If he was in Priority 1 or 2 the 21 months must be during the present term of service

INDUCTION GROUP

Requests for delay in active duty orders have been asked for some of those physicians who accepted commissions after receiving orders for induction, and before being inducted This is entirely out of order except where there are very special extenuating circumstances Therefore the Health Resources Advisory Committee is calling all records of such cases to Washington for review In fairness to the state committees there have been instances where such delays have been requested and granted without the knowledge of the committee, or without regard to the advice of the committee

PHYSICIAN DRAFT

The following item was taken from *Selective Service* for August, 1951

The planned induction under Selective Service of 333 Priority 1 medical officers scheduled during the month of August has been delayed temporarily at the request of the Department of Defense

In requesting the delay the Department of Defense stated that the delay was based entirely upon an unanticipated and sustained increase in the number of doctors applying for Reserve Commissions in the Armed Forces Whether or not all of the doctors whose induction will be delayed during August will be called during September is dependent upon the volunteer rate during the next few weeks the Department of Defense said

The Secretary of Defense has indicated that no reduction is anticipated at this time for the call of 152 Priority 1 doctors scheduled to be inducted during September

PHYSICIAN INDUCTIONS

The following item was taken from *Selective Service* for September, 1951

State Directors have reported to National Headquarters that many of the special registrants ordered by their local boards to report for induction on the July call for 717 doctors were found to have been previously commissioned This brought to light the fact that the Armed Forces were not in every instance forwarding a D D Form 44 to his local board after a man was commissioned

Since the July call for special registrants was issued the Armed Forces have commissioned 429 doctors Of this number 333 received Army commissions 186 Air Force 3 Navy and 7 were commissioned by the United States Public Health Service

Incomplete reports from the States also disclosed that 10 doctors were declared physically unfit 80 were reclassified, postponed or cancelled 2 were inducted an indefinite number are still pending for one reason or another and another very small number are believed to be delinquent and will be reported as such by their local boards.

Of the two inducted it has recently been reported in the public press that one of them agreed to accept a commission after completion of 3 days service as an enlisted man.

ARMY

Anniversary of Birth of Walter Reed—The 100th anniversary of the birth of Walter Reed, major, U S Army, conqueror of yellow fever, was commemorated Sept 13 at New York University College of Medicine, where he received his M.D degree in 1873 The College of Medicine opened an exhibit depicting Dr Reed s life and work, and a new portrait of the distinguished alumnus was presented to the College

The speakers at this event were Acting Chancellor James L Madden of New York University, Dean Currier McEwen, of the College, and Dr Walter Levy, president of the Alumni Association The portrait is being carried on the cover of the current issue of the alumni magazine, the *New York University Medical Quarterly*

Personal—A retirement ceremony was held at Fort Monroe Va recently for Brig Gen Robert P Williams, chief Army Field Forces Medical Section, and Col Henry S Blasse, post surgeon, both of whom retired after many years of faithful service in the Army Medical Corps Brigadier General Williams, after his return from Europe, where he will visit field medical units for the Surgeon General's office will make his home in Baltimore, where he will become deputy state health commissioner Colonel Blasse plans to settle in San Antonio, Texas

AIR FORCE

Award and Commendation.—The Air Force announced Sept 4 that the Legion of Merit has been awarded to Dr Cortez F Enloe, a consultant to the USAF Medical Service, for wartime service in research on the effects of bombing on health and medical care The medal was presented to Dr Enloe by the Surgeon General of the Air Force at a ceremony in The Pentagon During World War II, Dr Enloe was chief of the Medical Sciences Branch of the U S Strategic Bombing Survey which compiled data on planning military and civilian defense measures against aerial bombardment His report, subsequently produced as a War Department publication The Effects of Bombing on Health and Medical Care in Germany, has become a standard reference for military and civilian defense planning Dr Enloe was a major in the Medical Service during the war, and for the past two years has been a consultant to the Air Force Surgeon General s office He is a specialist in internal medicine

CIVIL SERVICE COMMISSION

Positions Open at St. Elizabeth's Hospital—The Civil Service Commission announces a medical officer examination for filling the following positions in St Elizabeth s Hospital, Washington D C rotating intern $2 200 a year, psychiatric resident, $3 400 to $4,200 a year surgical resident $4,200 to $4,700 a year, and *general practice resident* $3,400 to $3,800 a year All applicants must have had appropriate education in an approved medical school Applicants for psychiatric, surgical, and general practice resident must also have completed a one year internship In addition applicants for surgical resident *appointments must* have completed a two-year *residency in* surgery No written tests are required The maximum age limit is 35 years

Persons who applied for but did not receive *appointments* under the commission s 1950 examination for the above positions should apply for this new examination

Information may be obtained from the U S Civil Service Commission Washington 25, D C, or from most first and second-class post offices Applications will be accepted until further notice by the Committee of U S Civil Service Examiners St Elizabeth s Hospital Washington 25, D C

PUBLIC HEALTH SERVICE

Malaria in Returning Military Personnel—More than 800 cases of malaria among military personnel returning from Korea have been reported to the U S Public Health Service by state health authorities recently Seven states alone reported over 600 new cases in July most of them contracted outside the United States The seven states with the number of cases reported from each are Arkansas, 38, Colorado, 65, Georgia, 237, Kentucky, 97, Oklahoma, 101, Oregon, 29 and Wisconsin 60 (total, 627)

These figures are only tentative, according to the Surgeon General, since many Armed Services hospitals do not report new cases to state health departments, whereas some of the cases may have been reported by more than one service hospital It is also difficult to determine precisely the number of service-connected cases because reports from some states do not distinguish between military and nonmilitary cases or between those acquired in this country and abroad

Despite their incompleteness, the reports to date emphasize the need for effective control measures Dr Scheele warns More cases were reported in July than during the preceding six months "As long as prompt and adequate surveillance and preventive action are taken, he stated, 'a resurgence of the malaria epidemics of 25 and 50 years ago can be avoided ' He added that prior to Korea vivax malaria, which once blanketed large sections of the United States extending as far north as Canada and incapacitating hundreds of thousands of persons annually, had virtually been eliminated from this country as a result of improved living conditions and the widespread use of insecticides

Only two proved new cases of malaria contracted in the United States have been reported in this country so far this year," Dr Scheele stated, but we are continuing our investigations, through the state health departments, to ascertain the status of domestically acquired malaria "

The National Office of Vital Statistics sent a telegram to each state health department the last week in August requesting that malaria cases be included in their weekly reports to the Public Health Service NOVS asked further that the cases be identified according to their origin—that is, whether civilian or from military establishments NOVS asked also for state-by state figures from Jan 1 to the date of the telegram This information will be made available in detail in subsequent NOVS publications

Dr Scheele said that all health officials must remain continuously vigilant if the spread of imported malaria is to be prevented He pointed out that a letter was sent out by the Public Health Service early this month to all state and territorial health officers, calling for competent diagnosis, adequate treatment, prompt reporting, and preventive use of insecticides The letter recommended that health officials notify all physicians to send blood specimen slides of malaria or suspected malaria cases to the National Depository for Malaria Slides, at Chamblee Ga , that they treat the patients with modern antimalarial drugs which relieve symptoms promptly, and that they recommend spraying with residual insecticides in all houses within a mile of the residences around which malarial mosquitoes may be found

The Training of Foreign Physicians—Training in the United States for 523 foreign physicians and other health workers during the 1951 fiscal year was arranged and supervised by the Division of International Health of the U S Public Health Service This is the second year that over 500 foreign trainees have been given this service by the division The 1951 fiscal year also marked completion of a program to train 100 Filipino public health specialists under the Philippine Rehabilitation Act of 1946 The outstanding change that occurred during the year was doubling of the number of specialists who came for training under fellowship programs There were 290 persons in this category, compared with 134 during 1950 These trainees came from 50 countries While the fellowships usually are for one year of training they may be for periods of 60 to 90 days or for as long as two years They were provided under Point IV bilateral programs of technical assistance to underdeveloped areas under special programs of the Department of State the Economic Cooperation Administration, the Philippine Rehabilitation Act and the World Health Organization, and under programs sponsored by authorities for the government and relief of occupied areas, including Germany, Austria, Japan, and the Ryukyus

There were 233 other health workers for whom the division arranged itineraries and advanced training during the year These specialists did not hold United Nations or United States fellowships, and their training was sponsored by nongovernmental organizations or by their own governments They came from 54 countries with the largest number, 77, from Europe, and about 50 each from the Middle East and Africa, the Far East, and the Americas

Investigate Outbreak of "Pleurodynia "—Two scientists from the laboratory of infectious diseases of the National Institutes of Health, Public Health Service are in Bonham, Texas, at the request of the state health department to investigate an outbreak of illness resembling pleurodynia which has been reported in Fannin County and the nearby area They are Dr Robert J Huebner, chief of the virus section of the laboratory, and Dr Joseph A Bell, epidemiologist The attack rate of the disease is high, and it has appeared in all age groups, according to a report sent to the Public Health Service by Dr George W Cox, state health officer It is estimated that several thousand cases have occurred since the outbreak began

State and Federal laboratories are proceeding with an investigation to isolate the etiologic agent This includes virus studies of stool and throat washings and complement fixation and neutralizing tests on paired blood sera Dr Huebner has sent 200 blood specimens by air to the infectious disease laboratory at the National Institutes of Health for additional analysis and testing Health authorities surmise that the outbreak may represent a Coxsackie infection, possibly of the B type, but final determination awaits the outcome of laboratory studies

Dr Cox reports that the disease is generally mild rather self-limited, and of short duration Symptoms are frequently severe, consisting of fever from 101 to 104 F , nausea, vomiting, and particularly severe pain across the upper abdomen or lower chest Frequently the patient has complained of difficult or painful breathing Some of the earlier cases were originally thought to be appendicitis because of the localized pain in the lower right quadrant and the sudden onset of fever

Search for Genetic Damage in Radiologists' Children.—A national survey to determine the prevalence of congenital malformations among the children of physicians, laboratory aides, and others who are constantly exposed to radiation through their work in x ray or radium therapy will be made with the aid of a Public Health Service grant This survey, to be made among some 4 000 radiologists in the United States, will be the first attempt to determine in a human population whether and how radiation causes important hereditary changes within a period of one or two generations The outcome of the study, under the direction of Dr Stanley H Macht of the Washington County Hospital, Hagerstown Md , may throw some light on radiation effects which may result from atomic warfare, it may reveal whether current protective measures for workers in radiological laboratories are really safe

Dr Macht will make his survey through a questionnaire which will ask not only what defects have developed among the children of radiological workers but also what effects radiation may have had on child bearing (In lower mammals radiation during the period of gestation has often created marked genetic variations from normal in the offspring) The results of this questionnaire will be compared with results of the same questionnaire sent to a group of 4,000 physicians who do not come in contact with radiation of any type

This grant is one of 283, totalling $2,255,392, approved by the Surgeon General of the Public Health Service, following the recommendations of the National Advisory Health Council at its last meeting

Heart Institute Grants.—The Heart Institute of the National Institutes of Health has made grants totalling $3,048,640 to 81 medical schools, hospitals, research institutions, and private individuals in 32 states the District of Columbia, and Puerto Rico in support of basic and clinical heart research The grants were approved by Dr Leonard A Scheele, Surgeon General of the Public Health Service, on recommendation of the National Advisory Heart Council They constitute the first of several groups of grants for heart research to be made by the institute in the new fiscal year beginning July 1 A total of $5,062,275 was awarded in support of similar research during the last fiscal year

FOREIGN LETTERS

SWEDEN

Comparison of Amithiozone and Paraaminosalicylic Acid—The introduction by Domagk of amithiozone (conteben®) as a remedy for tuberculosis has been followed by a spate of publications on this subject particularly in Germany, where this preparation is widely used It has been well received in Sweden, where its chief competitor in this field is paraaminosalicylic acid In 1948 the Swedish National Association Against Tuberculosis sponsored a statistical investigation of the comparative merits of paraaminosalicylic acid and expectant treatment of tuberculosis, in which results with paraaminosalicylic acid were most favorable During the latter half of 1949 and early in 1950, an attempt was made at the Söderby Hospital to ascertain which of the two remedies amithiozone or paraaminosalicylic acid is the more effective in pulmonary tuberculosis

This investigation has been reported on by Dr Rune Ravell in the journal of the Swedish Medical Association *Svenska Lakartidningen* for Aug 3 1951 Fifty four patients, most of them with chronic, advanced disease, unsuitable for lung collapse therapy were selected for this investigation, 27 receiving amithiozone and 27 paraaminosalicylic acid They received during the 12 weeks of this test only rest and the usual sanatorium regimen None of them had hitherto received any specific chemotherapy The amithiozone was given in an initial dose of 0 025 gm twice daily and raised at 10-day intervals to a final dosage of 0 5 gm four times daily Paraaminosalicylic acid was given in four doses of 5, 2, 2 and 5 gm, for a total daily dose of 14 gm The effects of this treatment were judged by clinical findings supplemented by sedimentation rate and sputum and roentgen findings Both remedies scored considerable success, of approximately equal value But several more amithiozone treated patients had to discontinue treatment because of complications traceable to this drug than was the case with paraaminosalicylic acid treated patients These complications were also more serious in the amithiozone treated than in the paraaminosalicylic acid treated patients

Corticotropin (ACTH) for Rheumatic Fever in Childhood—At the Children s Department of the Norrkoping Hospital, Brita Appelbom and Sven Tornqvist have had encouraging results with the Danish corticotropin preparation acton" which was given to six children, 4½ to 10 years of age, with acute rheumatic fever Their detailed records show, among other things, how promptly the electrocardiographic changes improved under this treatment The cost of the preparation is at present about one Danish krone per milligram Even when such treatment entails an expenditure of several hundred kroner in each case, these sums evidently represent a sound investment of capital, in view of the results achieved All these children have been treated too recently to permit claims of lasting cure

Swedish National Association Against Tuberculosis.—The 1950 annual report of the Swedish National Association Against Tuberculosis gives a good account of what this body is doing In an appendix to the report is published the list of gifts received from 1904 through 1950 It is interesting to note the wide fluctuations each year in the sums given to such a representative national body For example, 1917 was a good year, with donations amounting to over 237 000 kr whereas in 1914 the total was less than 9 kr The total for the whole of this period ran into millions Other important sources of revenue were sales of Christmas and New Year seals and telegraph forms These alone brought in over a million kr in 1950

The Association has many expenditures A short film on BCG vaccination and another on mass radiography are loaned to cinemas as curtain raisers" Publications include the Association's quarterly journal and a great number of special reports, among them a survey of tuberculosis mortality in Sweden in 1943 1946 and a report on the activity of tuberculosis institutions in Sweden in 1949 In 1950 a statistical study of treatment with paraaminosalicylic acid (PAS) was based on the experiences of five of the Association s sanatoriums and was published in the *American Review of Tuberculosis* (Vol 61, 1950) Another statistical study was undertaken in 1950 at four sanatoriums to ascertain the relative merits of paraaminosalicylic acid and streptomycin in the treatment of pulmonary tuberculosis This study will be published in 1951

The Association also makes important financial contributions to special scientific investigations One of these is a follow-up study of school children vaccinated with BCG in Stockholm A study by Professors Hans Davide and Hugo Theorell is concerned with antibiotics and tuberculosis, and a study by Prof Alf Westergren deals with multiple infections associated with tuberculosis In 1950 the Association helped to finance the visits of Swedish scientists to England, Italy, Argentina, Switzerland, France, and other countries

NORWAY

Hepatitis Among Laboratory Nurses—At the Ullevaal Hospital some curious observations have been made concerning the liability of laboratory nurses to develop hepatitis Every year at this hospital there are usually 500 probationer nurses, 645 trained nurses and 55 laboratory nurses who first were given the usual nursing training Between Jan 1, 1945, and Dec 31, 1951, there were as many as 58 cases of hepatitis among the nursing staff Nineteen of these patients were probationer nurses, another 19 were fully trained nurses, and 20 were laboratory nurses at the time they fell ill Most of these laboratory cases occurred during the first year of laboratory service Dr V Gaustad, who supplied these figures, pointed out how difficult it is in practice to protect laboratory nurses from infection when they have to deal with samples of blood and plasma The ideal would be to produce an effective vaccine he referred hopefully to the experimental investigations recently undertaken by Henle and his associates whose findings were published in 1950 in the *Journal of Experimental Medicine*

Norwegian National Association Against Tuberculosis—The annual meeting of the Association on May 28 was the occasion for a series of conferences on its functions and the expansion or limitation of its activities according to the varying needs of the times In 1946 the name of the organization was expanded to *The National Association Against Tuberculosis for the Health of the Nation* While tuberculosis is decreasing year by year the revenue of the Association has decidedly increased For this reason also, it seemed fitting that the organization look further afield than to the immediate care of the tuberculous

One of the principles of the Association in the past has been to take up new work and later, when everything was running smoothly to pass it on to the state or municipalities in order to turn to more pressing needs Thus the Association started the BCG laboratory in Bergen in 1937 under the leadership of Dr Konrad Birkhaug, who had brought a BCG strain from the Pasteur Institute in Paris The work and costs of this laboratory have increased greatly, especially since 1947, when BCG vaccination was made compulsory in Norway At its annual meeting this year the Association called on the state to take over this laboratory as of July 1 1952 when its equipment would be offered as a gift to the state

With revenues set free by steps such as this the Association will be able to expand its activities in other directions, notably the training of nurses, the welfare of the aged, and popular health education The Association s secretary general, Dr Tobias

Sympathetic Nerve Block in Cholecystitis.—Eastwood and Womack practiced paravertebral procaine block in 14 patients with acute cholecystitis Ten patients obtained immediate and complete relief from pain, which lasted 24 hours to several weeks At operation one to two days after the injection, six of these patients were found to have subsiding acute cholecystitis One patient, who had undergone cholecystectomy in another hospital several years before was found to have a long cystic duct remnant with surrounding scar tissue enmeshing sympathetic nerve fibers One patient with a long history of pyloric ulcer had a normal gallbladder but an inflammatory process resulting from an ulcer in the region of the hepatic plexuses In one patient with pain and jaundice who had immediate relief from pain and rapid subsidence of the jaundice a normal gallbladder was found at operation but there was severe hepatic degeneration with cholangitis The jaundice in this case was interpreted as due to reflex spasm of the sphincteric mechanism of the common bile duct In one patient who received relief, the abdomen was not explored because of marked obesity Of the four patients who received no relief, one had multiple liver abscesses associated with typhoid with diaphragmatic and parietal wall involvement, one had a previously ruptured gallbladder with subphrenic abscess, and two were not subjected to operation a diagnosis of psychoneurosis being established after further study

Measurement of Blood Flow—It has been claimed that the rate of disappearance of radioactive sodium (Na^{24}) from muscle after its intramuscular injection is a measure of the efficacy of local tissue circulation and that this test can be used in the evaluation of peripheral vascular disorders Results of the present study do not confirm this claim The rate of clearance of Na^{24} from the gastrocnemius muscle was determined in 34 subjects of different ages Thirteen of these had intermittent claudication, the others had no clinical evidence of vascular disease The clearance rates at rest and after exercise varied widely and were not significantly different in the two groups The authors conclude that Na^{24} clearance is not a reliable measure of blood flow There appears to be no direct relationship between the two, although this can be established with certainty only by simultaneous direct measurement of blood flow and estimation of Na^{24} clearance

Cardioangiography.—The injection of a radiopaque substance directly into the ventricular chambers as a means of roentgenologic visualization of the heart and great vessels was studied by the authors in 30 patients They performed 45 cardiac punctures on these patients without mortality or serious reaction, injecting 50 cc of 75% iodopyracet solution (diodrast*) into the right ventricle under a pressure of 25 lb and into the left ventricle under a pressure of 30 lb The puncture produced no symptoms in 18 patients, eight complained of slight discomfort in the upper abdomen or retrosternal region and four reported amelioration of preexisting dyspnea and cough There were no variations in blood pressure at the time of the puncture, but when the iodopyracet was injected the systolic blood pressure dropped 10 to 40 mm of mercury in most cases In one patient the pressure dropped to zero but rapidly returned to normal after the administration of nikethamide (coramine*) and of ephedrine There were no fluoroscopic or auscultatory changes following the puncture Electrocardiographic changes were minimal Transitory ventricular extrasystoles were frequently seen at the moment of puncture of the myocardium On four occasions immediately after the injection of iodopyracet into the right ventricle a transient right bundle branch block was observed One patient with a preexisting posterior wall infarction showed no variation in the electrocardiogram during or after cardioangiography This procedure yielded clearer roentgenograms of the ventricular chambers, coronary arteries and great vessels than those obtained when the opaque medium is introduced into a peripheral vessel The method was of particular diagnostic value in demonstrating changes in pulmonary circulation and in the aorta, including the abdominal aorta and its branches

Studies of Intracranial Tumors with Fluorescein Dyes —In the last few years attempts have been made to utilize a unique property of central nervous system vessels (blood brain barrier) for the diagnosis and localization of brain tumors It has been found that most positively charged (basic) dyes penetrate into the central nervous system, while negatively charged dyes (acidic) are generally incapable of passing into the brain tissue Under certain pathological conditions this barrier is broken down locally In the presence of a tumor or abscess an acid dye will easily penetrate into the area of the lesion but not into the surrounding normal brain substance The acid-chromogen dye sodium fluorescein has proved most useful, since low tissue concentrations can be readily detected because of the highly fluorescent properties of the dye under ultraviolet light At the Department of Surgery of the University of Minnesota Medical School fluorescein dyes were used routinely for craniotomies in which a brain tumor was suspected The surgeon hands the biopsy material suspected of containing tumor tissue to the nurse, who in turn holds the tissue under the ultraviolet lamp In the laboratory the fluorescein test has been used for the evaluation of brain damage following injection of noxious agents Most interesting are changes seen after intra arterial injection of radiopaque media commonly used to perform cerebral angiograms Rabbits were injected intra arterially with iodopyracet injection (diodrast®), and later fluorescein was administered intravenously Some brains revealed under ultraviolet light an intensely fluorescent hemisphere on the side of the injection indicative of a broken blood brain barrier The authors discuss the use of radioactive diiodofluorescein and the Geiger Muller counter in the preoperative localization of brain tumors The method has been used to localize brain tumors preoperatively, but it did not prove to be sufficiently accurate to be used as the sole diagnostic test Two other radioactive agents investigated were radioactive potassium (K^{42}) and iodinated (I^{131}) human albumin The value of these agents is discussed Improved instrumentation such as the adaptation of scintillation counters to clinical use should increase the validity of the radioactive dye test

Diagnosis of Chronic Cor Pulmonale —Marks and Zimmerman present the second of three reports on chronic cor pulmonale prepared at the Cleveland City Hospital The first report attempted to correlate the clinical and the autopsy findings The present report deals with the roentgen findings and the differential diagnosis The third paper will deal with the physiological findings on patients studied by cardiac catheterization A recent report indicated that in only nine of 39 patients with chronic cor pulmonale was a correct diagnosis made by a roentgenologic study Analysis of the reasons for failure suggests that diagnosis of cor pulmonale is easily missed because 1 The patient is frequently very ill when admitted, and roentgenoscopic examination cannot be done satisfactorily 2 Roentgenograms in both oblique and posteroanterior projections are not taken 3 Extensive pulmonary disease may obscure the cardiac outline in all projections For a diagnosis of cor pulmonale, selective enlargement of the pulmonary conus and artery, with or without hypertrophy of the body of the right ventricle, must be shown Pulmonary emphysema is almost always a demonstrable feature Careful correlation of the clinical catheterization and roentgen findings are necessary to exclude other causes of an enlarged pulmonary conus and artery These conditions are certain forms of congenital heart disease, such as interatrial septal defect, Lutembacher s syndrome, high interventricular septal defect, patent ductus arteriosus, Eisenmenger s complex, and pulmonic stenosis, and also mitral stenosis, thyroid heart disease, cardiac failure, aneurysm of the pulmonary artery, kyphoscoliosis, Ayerza's disease, and idiopathic dilatation of the pulmonary artery

Operative Correction of Portal Hypertension.—Nine of the 16 patients with portal hypertension reported on by the authors had cirrhosis of the liver, and came for treatment because of gastro intestinal hemorrhage and ascites Four of the nine were not benefited by surgical treatment and died either postoperatively or within five months Portacaval or splenorenal shunts prevented hemorrhage and ascites in four patients for one to two years One patient has no ascites 10 years after ligation of the splenic artery with splenopexy and omentopexy Seven patients with portal hypertension had a normal liver and were treated for gastrointestinal hemorrhage alone There were no fatalities in this group Four of these patients had had a previous splenectomy with temporary or no benefit Portacaval or splenorenal shunts were performed in four patients, with no recurrence of hemorrhage for one year One patient remained well for three and a half years following ligation of the splenic artery and splenopexy A patient with a previous splenectomy had no further hemorrhages during the four years following division of numerous varices and omentopexy It is suggested that ligation of the splenic artery be combined with a direct portacaval shunt to reduce the volume of blood carried by the portal system Enlarged lymphatic vessels paralleling the portal vein were observed in every case with ascites and cirrhosis They are probably related to the increased lymph flow from the portal vein capillaries into the surrounding lymph spaces incident to the portal hypertension The surgical approach recommended for portacaval anastomosis is through a subcostal incision, with vertical extensions at both ends and excision of the costal cartilage opposite the fifth interspace, permitting lateral displacement of the costal margin and lateral rotation of the liver following division of the round ligament

Removal of Gallbladder —It has been maintained that the sphincter of Oddi becomes atonic and that the common bile duct undergoes a compensatory dilatation following extirpation of the gallbladder It was also believed that, if these changes do occur they are initiated by pathological processes rather than by the removal of the gallbladder Cholangiographic and manometric studies performed on 50 patients before cholecystectomy was done indicated that the pressure within the extrahepatic biliary system is governed by the secretory pressure of the liver and the resistance offered by the sphincter of Oddi When the sphincter contracts the ampullary orifice of the common bile duct is closed and the choledochal bile is forced into the gallbladder Evacuation of the bile occurs when the sphincter of Oddi relaxes and the gallbladder contracts The phase of sphincteric relaxation occurs at regular intervals and permits the bile to escape into the duodenum in rhythmic spurts No muscular movements, undulations or changes in the size, shape, or contour of the choledochus were observed, thus apparently bile ducts do not empty by peristaltic action Comparison of operative and postoperative manometric studies demonstrated that the sphincteric break occurred at the same levels in the anesthetized and nonanesthetized groups In studying the same patients after the removal of the gallbladder it was found that the common bile duct does not undergo a compensatory enlargement following the removal of the gallbladder Analysis of 1,700 cholangiograms of patients subjected to cholecystectomy failed to show dilatation of bile ducts unless some organic ductal obstruction was present Cholangiographic and manometric studies indicate that the spasmogenic drugs, such as morphine sulfate, demerol, dolophine and codeine sulfate, increase the tonal contractions of the sphincter of Oddi in both the patients having undergone cholecystectomy and those not operated on The spasmolytic drugs such as nitrites, aminophylline, diphenylacetyl diethylaminoethanol (trasentine®) hydrochloride, and papaverine, all cause the sphincter of Oddi to relax, but these effects are fleeting, as the intraductal pressures returned to normal within three minutes after administration of the nitrites and within 20 minutes after aminophylline Spasmogenic drugs, such as morphine sulfate, are more effective in relieving the pains of biliary colic than are the spasmolytic agents typified by the nitrites

Wound Bleeding During Operation Role of Blood Transfusions —When there is bleeding in the form of a massive generalized "ooze" from all cut surfaces of the operative wound, uncontrollable exsanguination and death may result The bleeding begins insidiously, usually during or immediately after operation, and proves refractory to all methods of hemostasis Of seven patients described, two were saved only because the surgical wounds allowed mechanical hemostasis by open packing All patients had received previous transfusions of whole blood, with known previous untoward reactions in four Clinical signs of transfusion reactions were sudden elevation of temperature, urticaria and jaundice, and sudden shock out of proportion to blood loss Laboratory evidence of hemolysis was present in four patients, with subsequent renal injury in one Determinations of subgroup differences other than major Rh factors were not done in any of the cases The possibility that shock and toxicity of anesthetic agents might play a part was considered, but most of the evidence incriminated blood transfusion reactions of hemolytic type Appreciably reduced platelets in three patients may have played a part in the blood dyscrasia Therapy was directed to all possible defects in the clotting mechanism, but without much effect Five of the seven cases occurred in a six months' period, three within the same month Investigations on technical matching and handling of blood have not been informative

Gastric Acidity Before and After Gastric Cancer —Gastric acidity is subnormal in persons with gastric cancer The percentage of achlorhydria is about three times as great and mean free acidity is about 13 clinical units less than the standard in normal persons of the same sex and age The range of gastric acidity in gastric cancer is not greatly different from that of normal persons The degree of subnormality of gastric acidity in gastric cancer varies with sex, age, resectability, symptomatology, and size of the cancer A major part of subnormality of mean gastric secretory activity appears before gastric cancer develops Mean gastric secretory activity of the pregastric cancer patient is subnormal regardless of the decade of life in which the test meal is performed and as long as 20 to 25 years before cancer develops This subnormality in gastric cancer is progressive and selective Evidence now tends to support the hypothesis that atrophy of the gastric mucous membrane plays an important part in the depression of mean gastric secretory activity before the development of cancer and that the atrophic gastric mucosa is a soil in which gastric cancer frequently develops Values for free gastric acidity have a definite but limited clinical application in the gastric cancer problem Their practical value as a mechanism for screening the persons in whom gastric cancer is most likely to develop awaits further study and application These values will not enable one to distinguish with certainty between benign and malignant gastric lesions, but in the management of small ulcerating gastric lesions the degree of free acidity of the gastric contents without reference to other clinical, roentgenologic, and laboratory data gives valuable information about the relative chances of malignancy and of the relative danger of even a temporary trial of medical treatment. As a prognostic device, the degree of free acidity in a case of gastric cancer may offer some encouragement to patients with high acidity, for the higher the secretory activity of the cancerous stomach the better the chances of a five year survival

Maintenance Dose and Toxicity of Digitoxin—Ninety five male patients and 76 female patients were given digitoxin in the Colorado General Hospital Outpatient Heart Clinic All patients have been compensated and maintained at what was felt to be an optimal level of digitalization for periods varying from two months to two years Results showed that the maintenance dose of digitoxin is between 0 05 and 0 2 mg per day, with rare exceptions Because as many as one fourth of the patients may be maintained on 0 05 mg daily, such a tablet should be available Age, sex, and weight have little if any effect on the maintenance dose of digitoxin, although patients weighing over 180 lb (81 6 kg) may require slightly larger dosage Digitoxin has the advantage of standardization by weight and of nearly complete absorption of an oral dose The drug has the disadvantages of very slow dissipation The tendency of inexperienced persons is to overdigitalize gradually, over a period of a few weeks This effect may be easily overcome by frequent and careful observation of the patient Toxic effects may persist as long as a week after discontinuance of the drug Of 43 patients with toxic effects of the drug, 23 complained of symptoms of digitalis toxicity and 23 showed signs of digitalis toxicity Only three patients showed both simultaneously Digitoxin may occasionally be given for as long as two months before toxic symptoms are manifested It appears probable that with digitoxin toxic signs frequently appear before symptoms If this is true, close supervision becomes even more imperative

Insulin and the Carotid Sinus.—Five men and five women between the ages of 21 and 63 with diabetes mellitus were studied to determine the effects of insulin on the carotid sinus reflex. A fasting blood sugar test and electrocardiogram were taken with the patient in a semireclining position The right and left carotid sinuses were each stimulated for 15 to 25 seconds by simple finger pressure and massage, and lead 2 was taken during this procedure The patients were then given unmodified insulin, the doses depending on the fasting blood sugar level At one, two and three hours after insulin was given, venous blood was drawn and analyzed for glucose Lead 2 was then recorded before and during right and left carotid sinus pressure Changes in the heart rate and blood pressure, the presence or absence of dizziness and related symptoms, and the production of syncope were noted during all phases of the study While cardioinhibitory effects of varying degrees were obtained in nine of the 10 patients before insulin was given, more decisive and greater reductions in heart rate were recorded one, two, and three hours after the administration of insulin Pronounced effects were produced after insulin administration in the patient aged 21 and in four between the ages of 40 and 45 as readily as in those of the sixth and seventh decades There was no appreciable difference in the behavior of either sex Dizziness was elicited by carotid sinus pressure in nine patients one hour after insulin was given and in 10 patients two to three hours after they received insulin No relationship existed between the blood sugar levels (hypoglycemia) and the extent of carotid sinus response One patient lost consciousness and had muscular twitchings before receiving insulin Five patients became unconscious one hour after receiving insulin, and eight became unconscious two to three hours after administration of the drug One of these cases of syncope was the result of a purely vasodepressor response while the others were all associated with striking reductions in heart rate These studies showed that in patients with diabetes mellitus insulin increases the activity of the carotid sinus reflex and is capable of stimulating the cardiac vagus at nonhypoglycemic levels. The hypoglycemic effect of insulin was eliminated by the use of comparatively small doses of the hormone and by the administration of dextrose whenever blood sugar levels fell below 80 mg. In three of the patients, in whom both syncopal and cardioinhibitory effects were observed, atropine and its derivatives were used with insulin and were effective in eliminating these symptoms Withdrawal of the insulin in two patients yielded the same beneficial results In patients with diabetes who have reactions apparently due to insulin shock, the author believes that determination of blood sugar levels would often show normal or elevated amounts He contends that some of these occurrences are actually vagal effects similar to those seen in carotid sinus syndromes

Terramycin in Rocky Mountain Spotted Fever—The diagnosis of Rocky Mountain spotted fever in the seven cases reported was based on headache, typical rash and fever, and on laboratory findings Four of the patients were children of from 3 to 12 years of age, three were adults Terramycin was administered in initial doses of approximately 50 mg per kilogram of body weight In adults, approximately 3 0 gm was given initially, followed by doses of 1 0 gm every eight hours Children received approximately two-thirds of the adult dose Therapy was continued until the temperature reached normal levels, provided defervesence was accompanied by clinical improvement In six of seven patients treated there was a striking abatement of the clinical symptoms within 48 hours and signs of illness disappeared within 72 hours One adult patient failed to show significant improvement after two days of oral treatment with terramycin, probably because he failed to attain a satisfactory level of antibiotic in the blood owing to faulty absorption from the gastrointestinal tract Intravenous administration of chloramphenicol resulted in a high concentration of antibiotic and recovery ensued Conceivably, a comparable form of terramycin would have been equally effective Terramycin hydrochloride suitable for intravenous use is now available The oral administration of terramycin caused mild gastrointestinal disturbances, which, however did not necessitate interruption of treatment The results obtained with terramycin in Rocky Mountain spotted fever compare favorably with those derived from chloramphenicol and aureomycin Seriously ill patients should also receive transfusions

Long Continued Use of Cortisone —Administration of cortisone acetate to patients with rheumatoid arthritis usually suppresses the disease manifestations, but relapse ensues after withdrawal For sustained improvement cortisone must be given more or less continuously The improvement that results from cortisone administration does not represent a correction of a glandular deficiency by substitution therapy but rather a favorable effect from an induced state of hormonal excess Hyperadrenocortical effects with such unwanted signs as disturbances in electrolyte, water, and carbohydrate metabolism skin changes, such as hypertrichosis acneform eruption, pigmentation, and striae, abnormal fat deposition, menstrual disorders, mental changes, and retardation of wound healing may develop Seventy six patients with rheumatoid arthritis were given cortisone It was necessary to discontinue treatment in 16 of these before six months The remaining 60 patients received the hormone uninterruptedly for six to 15 months Initial suppressive doses were given until the clinical manifestations were brought under control For severe and moderately severe cases 200 or 300 mg of the hormone was administered on the first day, followed thereafter by daily injections of 100 mg , for moderate and mild cases, 100 mg was given on the first and subsequent days When rheumatic activity had been suppressed, reductions were made by *5 to 10 mg per* dose at intervals of every five to seven days The smallest daily amount of cortisone required to maintain adequate, although not necessarily absolute, control was considered as the maintenance dose which was then continued, with adjustments in the daily amounts being made from time to time as changes in the clinical response or as the development of objectionable reactions dictated It was found more prudent to be content with improvement short of adverse effects rather than to strive for total suppression with unsafe doses The ability to sustain satisfactory improvement usually varied indirectly with the severity of the rheumatoid arthritis Unwanted signs of hormonal excess developed in 40% of cases at some time during the treatment Most of them disappeared or lessened when the dose of cortisone was reduced but, when this was done, the improvement often also declined Evidence of functional suppression of the adrenal cortices, as indicated by a decreased response of circulating eosinophils to exogenous corticotrophin, was present during prolonged cortisone therapy The depression was temporary Whether irreversible damage may result when the drug is employed for longer periods cannot yet be determined

Amithiozone in Tuberculosis.—Seventy five patients with moderately and far advanced pulmonary tuberculosis were treated with amithiozone (tibione®) or with amithiozone and streptomycin and/or paraaminosalicylic acid for six to 10 months *Anemia, leucopenia,* and granulocytopenia occurred in one patient who received 300 mg of amithiozone *daily This hematological crisis was controlled within a period of 12 days after* amithiozone was discontinued and intensive measures for restitution of the blood level were instituted The same patient then was given *150 mg* of amithiozone daily for 11 months without ill effect In daily dosage of 150 mg or less, amithiozone is a safe drug when administered under medical *supervision* and with adequate laboratory facilities It may be administered for long periods of time With a daily dose of 150 mg of amithiozone half of the authors' patients had a mild to moderate fall in hemoglobin and red blood cell count, and varying degrees of depression of the leucocytes *were observed in all patients* But these alterations were transitory and there was a return to normal with continued medication Of the 75 patients some degree of eosinophilia, usually transitory developed in 68, and of these 31 received no streptomycin The sedimentation rates failed to conform with improvement or *progression* of the disease Pretreatment total *serum proteins* and albumin and globulin determinations revealed hyperproteinemia and hyperglobulinemia in patients with long standing disease Results of liver function tests performed within two to six weeks after the start of therapy showed that amithiozone heightens or maintains the hyperproteinemia and hyperglobulinemia Cephalin flocculation tests revealed after 48 hours a 2+ flocculation in six patients and a 3+ flocculation in three patients receiving amithiozone therapy These results proved reversible in some of the patients with continued medication In three patients moderate degrees of icterus developed in association with slight to moderate hepatomegaly and anorexia, but this reaction to amithiozone was reversible and the drug may be resumed when the condition has subsided In 26 patients amithiozone caused gastrointestinal disturbances of mild to severe intensity, which disappeared when the drug was discontinued and were less likely to recur when administration of amithiozone was resumed Although it is too early to make a definite statement as to the therapeutic efficacy of amithiozone alone or in conjunction with streptomycin and/or paraaminosalicylic acid, it can be stated that conversion of sputum and clinical improvement was noted Combinations of amithiozone with streptomycin and of amithiozone, streptomycin and paraaminosalicylic acid seem to show greater clinical promise than any one of these substances used alone

Chronic Ulcerative Colitis and Carcinoma —Carcinoma of the colon or the rectum developed in the course of long standing and advanced chronic ulcerative colitis in nine patients These patients were among 226 surgically treated cases of ulcerative colitis—an incidence of 3 9% Seven of the nine had the carcinoma in the rectum two in the transverse colon The seven rectal carcinomas were removed in the course of an operation for ulcerative colitis and were discovered only at operation or on examination of the surgical specimen The transverse colon carcinomas were proved by surgical biopsy in one case and by autopsy in another These patients had chronic ulcerative colitis for 13 to 25 years Eight of the nine patients died within three years after the discovery of malignancy The one surviving patient is in excellent condition five years after an abdominoperineal resection, but she has had two metastatic carcinomatous nodules removed from the vaginal mucosa in the past two years Most, but by no means all, of the previous reports on the relationship between chronic ulcerative colitis and carcinoma indicate that carcinoma develops oftener in patients with ulcerative colitis and at a younger age than in the general population The polyposis occurring as a complication of ulcerative colitis is considered by many to represent true adenomas that are precursors of carcinoma Some observers deny the increased incidence or any causal relationship between ulcerative colitis and carcinoma Although final proof is not available, evidence is mounting that long standing, severe ulcerative colitis is related to the occurrence of malignant change

Cortisone in Chronic Ulcerative Disease of Bowel.—At the Brooklyn Veterans Administration Hospital, seven patients with proved ulcerative disease of the large and small bowel were given cortisone Most of the patients were given 50 mg of cortisone twice a day for 10 days In some of the patients a second series of cortisone treatments was given Proctoscopic and roentgenologic studies were made before and after the cortisone therapy Studies of blood electrolytes (sodium and potassium), glucose tolerance curves, and Thorn eosinophil response tests were done in each case In one patient there was a return to normal of the diffuse pattern of altered function of the small intestine A patient with joint symptoms showed a temporary response to cortisone therapy There was no evidence of alteration in the basic electrolytic pattern of the serum, no clinical evidences of hyperadrenalism appeared, nor were there any symptoms of adrenal exhaustion after completion of treatment All patients showed normal adrenal response in terms of the Thorn eosinophil test There was no evidence of beneficial effects on the ulcerative lesions of the large or small bowel with cortisone therapy

Toxoplasmosis in Pregnant Women.—During a short period in 1949 and 1950, 152 pregnant women, aged 23 5 on an average, admitted to the maternity service at the State University of Iowa, were tested for toxoplasmosis with the skin, neutralizing antibody complement fixation, and methylene dye reduction tests Careful obstetric histories were taken About half the group was nulliparous at the time of testing but most of the patients were delivered during the period of hospitalization and observation Of the 152 women, eight gave positive reactions to the tests, showing an incidence of subclinical toxoplasmosis of 5 26% The results of all four methods of testing correlated well The neutralizing antibody test seems to be the most consistent indicator, although the skin test is a reliable indicator in this type of survey In addition to the obstetric patients tested, seven infants were given skin tests to determine whether this method of testing would be deleterious to an infant No untoward symptoms were noted nor were any positive reactions recorded

Progesterone in Cancer of Prostate —Trunnell and co workers treated 19 patients with histologically diagnosed prostatic cancer with progesterone or with anhydrohydroxy progesterone Of the nine who had received no other treatment eight improved but two of these later relapsed Of the 10 in whom the progesterone preparations were used after they had relapsed despite castration or estrogen therapy, seven showed some improvement In six instances patients were made definitely worse as a result of these medications Four of the six received anhydrohydroxy-progesterone Although efficacious, the progesterone preparations cannot be recommended in preference to castration or to estrogen administration, but for patients who have relapsed after other forms of treatment, a trial of progesterone is indicated The authors employed a daily intramuscular dose of 100 mg of progesterone in 80% sesame oil in 20% benzyl alcohol In the event of apparent stimulation of the cancer growth, the dosage is decreased to 50 mg per day and may be reduced to 25 mg per day if necessary Doses larger than 100 mg per day have not given additional benefit and may result in stimulation of the cancer Experience with anhydrohydroxy progesterone has been even more limited, and this substance seems to be a two-edged sword Doses of 50 mg per day by mouth are suggested

Anti-Arthritic Agents Effects on Joint Temperature —This method for determining intra articular temperature consisted of inserting a filamentous copper-constantan thermocouple into the joint space (usually the knee) through the bore of an aspirating needle Serial intra-articular temperature determinations were made on 21 patients with rheumatoid arthritis before, during, and after a course of parenterally administered corticotrophin (ACTH) or cortisone Cell counts were made on the synovial fluid obtained at the time of aspiration for temperature determination in nine of the 21 patients There was a pronounced fall in joint temperature in every instance within the first 24 hours of corticotrophin or cortisone administration, which approached normal by the fourth day of the treatment period Joint fluid cell counts showed a pronounced drop Cortisone was administered orally to six patients with rheumatoid arthritis with serial joint temperature determinations showing a similar fall in every instance Eight patients with rheumatoid arthritis were given various other steroids for a period of one week and serial joint temperature determinations were made Cortisone was then substituted without the patients knowledge None of the supposed anti arthritic agents produced the fall in joint temperature that occurred in every case after the substitution of cortisone Serial joint temperature determination is suggested as a rapid and possibly specific laboratory method for establishing additional evidence of therapeutic effectiveness of anti arthritic agents

Digest of Bovine Plasma Value in Man —Investigation of the oral and parenteral nutritive value of an enzymatic digest of bovine plasma was undertaken in infants and adults It was found that the nitrogen retention and weight gains of male infants maintained on a synthetic" milk diet in which an enzymatic digest of bovine plasma constituted the principal source of protein, were equal, if not superior, to those obtained with an evaporated milk formula fed at the same fluid, caloric distribution, and nitrogen levels The nutritional value of the hydrolysate was not improved by reinforcement with isoleucine and methionine Tests of the digest given parenterally to adult males showed an average utilization of 86 3% of the infused nitrogen A comparison of available data on total amino nitrogen losses incurred by intravenous alimentation with various protein hydrolysate and amino acid preparations discloses that the losses found with the bovine plasma digest were not excessive In general, the total amino nitrogen wastage is higher with enzymatic digest of proteins The wastage of available peptides is about 30% of those infused, regardless of their concentration in the preparation However, the nutritional value of these products cannot be justly appraised by this criterion It is possible that the nutritional value of nitrogen derived from sources that include peptides may be greater than that of an equivalent amount of nitrogen in the form of a mixture of free amino acids

Effect of Additional 4 Minutes Rotation on Reactions to VDRL Slide Flocculation Test. W E Machala and F R Hassler —p 192.

Chloramphenicol in Granuloma Inguinale —Finely ground chloramphenicol (chloromycetin®) was suspended in graded amounts of sterile isotonic solution of sodium chloride until the resultant suspension contained 500 mg of chloramphenicol per cubic centimeter of suspension The final product had a consistency not unlike that of repository penicillin A single intramuscular injection of 2 gm of this suspension gave measurable serum levels for 24 hours and urinary excretion levels for 72 hours A 4 gm injection consistently maintained serum levels for 72 to 96 hours Initially, the treatment schedule was set at a single injection of 2 gm (4 cc of suspension) given intramuscularly every 96 hours for three injections, a total of 6 gm in eight days This schedule was increased to 4 gm every 72 hours after two patients treated with the previous schedule relapsed At another hospital a schedule of 4 gm of suspension every 96 hours was used from the start and throughout the study period Forty-three patients with granuloma inguinale were treated with this material Thirty-eight of these responded favorably and remained cured over follow up periods of from two to 11 months Two of the five patients who relapsed were in the group treated first, when too small doses were used No evidence of resistance to chloramphenicol was noted in the patients who were re treated The simplicity of the schedule in this parenteral administration of chloramphenicol makes this method suitable for use on outpatients

Carcinoma in Jejunal Ulceration —Jejunal ulceration is a rather frequent complication of gastroenterostomy for peptic ulcer, but malignant degeneration of a jejunal ulcer following gastroenterostomy must be extremely rare, since a comprehensive review of literature revealed only one such case, which was reported by Santy in 1939 The authors report a case of their own A man, 67, with a ruptured pyloric ulcer was treated by closure of the perforation and short loop posterior gastroenterostomy He was well for 14½ years then rather suddenly a sense of fulness developed in the abdomen followed by pain, nausea and vomiting He improved temporarily on an ulcer regimen, but later had to be hospitalized, because of continued vomiting and loss of 40 lb (18 1 kg) in six months At operation a mass was found and removed by wide excision The operation involved transverse colectomy, subtotal gastrectomy, and resection of a portion of the jejunum beginning at the duodenojejunal juncture The jejunal and colonic continuity were reestablished by end to-end anastomosis, then antecolic, antiperistaltic gastrojejunostomy was done, and a small knuckle colostomy proximal to the colon anastomosis was made, after which the abdomen was closed in layers without drainage Approximately four weeks were allowed for improvement in nutritive state before the colostomy was closed Five and one half months later there was no evidence of recurrence Apparently, the inherent lack of potential of the epithelium of the small bowel for neoplasia is an important factor in the rarity of malignant degeneration in marginal ulcers The authors state that after completion of their report their attention was called to a number of similar cases reported in the European literature

Carob Flour in Gastrointestinal Disturbances.—Carob flour is obtained from the pulp of the pod of the carob tree, which is found along the shores of the Mediterranean, in Southern Europe, in Africa, and in Asia A Spanish observer noticed that constipation developed in animals and children eating the flower and decided to use it in the treatment of diarrhea Andrews used carob flour in 100 children with diarrhea, who ranged in age from 7 days to 12 years Carob flour was used as an adjunct to fluid and electrolyte replacement therapy, chemotherapy of various types, and other routine measures Carob flour was never used unless the diarrhea was a major problem It was fed mixed with water and sweetened with saccharin, for 48 to 72 hours After this the flour was incorporated into the formula and fed at regular intervals After the formula was begun the water solution of carob flour was continued between feedings It was found most practical to use a 5% solution in children under 2 years of age and a 10% solution in those over 2 The author concluded that carob flour is of distinct benefit as an adjunct in the treatment of diarrhea Regurgitation of the fluid or formula containing carob flour was fairly frequent, but this did not seem to influence the progress or the improvement in the stools

Complications Following Prostatic Surgery —Of 600 patients who had undergone prostatectomy during a five-year period (1945 1950), 157 returned questionnaires that could be used in an analysis An attempt was made to evaluate the patient s complaints, emphasis being placed on the symptoms of incontinence and impotence There were cross-checks in the questionnaire on the validity of the symptom and the reliability of the patient Each case was further checked against the hospital record, and no case was included in which less than four months had elapsed since the surgical treatment A transurethral electroresection was done in 80 patients, conservative perineal resection in 48, total and radical perineal operation in 19, suprapubic operation in seven, and retropubic operation in three A total of 19 1% of these patients had either stress or total incontinence following their operation and had to wear a pad or some appliance Prior to surgery, 8 9% of the patients were classified as impotent Following surgery an additional 32 5% had been made impotent A decrease in sexual activity was noted by 63 1% of the cases following prostatic surgery In some instances age may have colored the memories of the patients, especially with regard to their preoperative condition

Hypertension and Arterial Disease —This is a study of 88 patients (14 men and 74 women) with hypertension, most of whom were ambulatory They were followed for an average of 32 months but some were studied for over 100 months The patients were classified into three weight groups overweight, underweight and normal weight The overweight group have more coronary disease, more left ventricular hypertrophy higher average blood pressures, lower average age, more elevated blood cholesterol more frequent and more serious retinal vessel changes and higher death rate from associated complications than do either of the other two groups Cerebral vascular accidents seemed particularly common in the overweight group, and coronary deaths were commonest in the underweight group Fifty six patients were treated with potassium thiocyanate No effect on blood pressure was noted in 39 of these 56 patients, there was a slight lowering in 14 and there was a rise in three patients Salt restriction was tried with unimpressive results in 32 patients but the diet was probably not adhered to closely Sedatives of various types were tried on 21 patients, there was no effect in 14 cases a slight lowering effect in seven cases Loss of weight caused lowering of pressure in seven of 19 patients No effect was observed in 12 patients This result surpasses that of any of the other treatments though it is still only about 40% The results obtained with the veratrum alkaloids and the nitrite groups were not impressive It was found that of 63 patients, 39 could not tell when the blood pressure was up or down 14 actually felt better when the pressure was up four patients were equivocal, sometimes feeling better when the pressure was up and sometimes when it was down, and only six patients felt consistently better when the pressure was down Hypertension should be regarded merely as a condition occurring in patients in whom the arterial pathology occurs earlier, more frequently, and more severely than in the nonhypertensive group of patients, the latter having the same vascular degenerations but to a lesser extent Hypertension is important not in itself, but because of the underlying and associated vascular changes

Adrenal Cortical Function in Diabetes.—The levels of circulating eosinophils as a measure of adrenal cortical response to the stress of surgery were followed in 25 diabetics and 13 non diabetics All the nondiabetics had eosinophil levels that were decreased more than 50% of the preoperative count Ten of the diabetics showed diminished adrenal cortical function, as indicated by an eosinophil count on the second postoperative day that was depressed less than 50% of the preoperative level Four hour corticotrophin (ACTH) and cortisone tests were done on five of these 10 diabetics and confirmed the reduced adrenal cortical reserve The adrenal cortex was capable of responding normally to the initial stress of surgery, but its reserve capacity was insufficient to maintain the eosinopenia for 48 hours The abnormal adrenal response seems to be correlated with the duration of the diabetes It is possible that this decrease in the activity of the adrenal may be a compensatory change resulting from the relative insulin deficiency

Alpha Tocopherol for Menopausal Syndrome —Histories of two women are presented in whom severe menopausal symptoms were controlled by alpha tocopherol Estrogen therapy was believed to be contraindicated in these patients A review of the literature shows that 365 cases treated with alpha tocopherol have now been reported, with about two out of three patients being greatly relieved The mechanism of this control of symptoms is obscure Vitamin E does not have estrogenic effects in rats or humans Evidence as to its possible endocrine effects is contradictory It was suggested that the effects of vitamin E are not mediated through hormonal mechanisms The author feels that alpha tocopherol is a safe medication and should be tried in cases with contraindications to the use of estrogens

Venous Thrombosis and Pulmonary Embolism —The material for the present study was obtained from routine autopsies on 100 unselected male patients over the age of 40 Special attention was given to the lungs and to the veins of the lower extremities The pulmonary arteries and their branches were carefully searched for pulmonary emboli by the open book method All gross emboli were confirmed by microscopic examination, and an attempt was made to compare their ages with those of the primary thrombi in the leg veins The veins were removed in continuity from the lower end of the inferior vena cava to the posterior tibial vein at the level of the internal malleolus The specimen in one piece was laid out flat, opened with a fine pair of scissors, and inspected for thrombi and for other lesions The opened veins were then stretched out and immersed in 10% formaldehyde All suspected thrombi were sectioned and examined microscopically to prove their ante mortem occurrence When points of small incipient thrombosis were encountered, the thrombosed segments were removed, in toto and subjected to complete serial section There were gross demonstrable venous thrombi in 34% of the cases Of these cases a pulmonary embolus was found in 56% (19% of the total series) The incidence of thrombosis was the same for various decades Seventy three per cent of the thrombi arose in the thigh and pelvic veins Nearly one third of all thrombi arose in relation to a valve pocket The diagnosis of primary pulmonary thrombosis, as a disease entity, is unwarranted Surgical ligation of the superficial femoral veins, either prophylactically or therapeutically, does not appear to be justified The separation of thrombophlebitis and phlebothrombosis, because of a supposed difference in an embolic potential, is not warranted Serial section studies have failed to show any underlying intimal changes that would act as a precipitating factor in thrombus formation

Procaine Amide for Cardiac Arrhythmias in Thoracic Surgery —Ordinarily harmless rhythmic abnormalities may be potentially dangerous during surgery and general anesthesia Among the drugs used for ventricular arrhythmias, intravenously administered procaine has given the best results The amide of procaine (pronestyl) may be administered in relatively large doses and will exert the effects of procaine for prolonged periods It was used in the prophylaxis and therapy of arrhythmias in patients subjected to thoracic operations under cyclopropane anesthesia It was given orally to 22 patients in doses of 1 0 to 2 0 gm , one to two hours prior to induction The control series consisted of 25 patients During thoracotomy an additional 1 0 gm was administered intravenously in 10% solution, in divided doses, in order to achieve peak plasma concentrations of procaine amide at the time intrathoracic manipulations began More of the drug was administered intravenously during the subsequent maintenance period for therapy or for pharmacologic study Prophylactic administration reduced the incidence of all types of arrhythmias, of ventricular arrhythmias especially, and of ventricular tachycardia particularly The drug was used in the treatment of ventricular arrhythmias in 17 patients Intravenous injections were made 29 times, with reversion to normal sinus rhythm 25 times The four ventricular arrhythmias that persisted reverted to normal sinus rhythm after a second injection The dosage ranged from 0 1 to 1 0 gm and averaged 0 5 gm Procaine amide was used only after measures other than drugs had been unsuccessful, and it was more effective than all other measures combined, being particularly effective in patients who had received the drug prophylactically The authors present the histories of seven patients in whom the drug proved therapeutically effective They analyzed the factors concerned in the onset of arrhythmias during cyclopropane anesthesia and found that inadequate ventilation appeared to be the chief factor

Calcium Chloride in Treatment of Cardiac Arrest.—Kay and Blalock cite histories of four patients to show the efficacy of 2 to 4 cc of 10% calcium chloride in improving heart contractions in impending ventricular standstill and in the treatment of ventricular standstill occurring spontaneously or following the successful electrical defibrillation of a heart in ventricular fibrillation The case of a girl, 5, demonstrates the therapeutic value of 4 cc. of 10% calcium chloride after 0 5 cc of 1 1000 epinephrine hydrochloride failed in three attempts in the treatment of ventricular standstill In a 14-month old child, 3 cc of 10% calcium chloride restored normal cardiac contractions after 0 5 cc of 1 1000 epinephrine chloride had failed to do so Although the heart had not entirely stopped beating when the calcium chloride was given to this patient, the blood pressure was not obtainable The case demonstrated dramatically the improvement in cardiac function following the injection of 3 cc of 10% calcium chloride In the fourth patient, 2 5 cc of 10% calcium chloride injected into the left ventricular cavity restored a normal heart beat after 0 5 cc of 1 1000 epinephrine hydrochloride failed Shortly afterward the heart beat became weak and 0 5 cc of 1 1000 epinephrine hydrochloride improved the cardiac contractions Calcium chloride is not necessarily superior to epinephrine hydrochloride, but the armamentarium of the surgeon should include several cardiac stimulants Irrespective of the cardiac stimulant used in the treatment of ventricular standstill, vigorous cardiac massage must be continued until an effective beat has been restored

Placental Findings in Erythroblastosis Fetalis.—Among 5,945 pregnant women whose Rh status was investigated, 845 were Rh negative In 88 (or over 10%) of these 845, more than an isolated trace of antibodies developed during pregnancy It was possible to compare the fetal outcome with the placental findings in 74 cases The significant microscopic placental abnormalities included increased numbers of nucleated red blood cells in the fetal vessels, edema of the stroma, abnormally large villi, a relative decrease in the number of fetal vessels, clubbing of the villi, persistence of the Langhans' layer, and the presence of Hofbauer cells At least one of these abnormalities was present in 31 of 37 placentas in which hemolytic disease of the newborn had been definitely diagnosed and also in seven of 22 cases in which there was no evidence of erythroblastosis fetalis Of the 24 patients whose placentas evidenced two or more abnormalities, 20 had infants with proved hemolytic disease, two had infants with a questionable diagnosis, and two had normal infants The increased incidence of two or more placental abnormalities in the mothers whose infants died from erythroblastosis fetalis in contrast to those who survived suggests that this observation is of prognostic value It is felt that most of the placental changes are the direct result of a reaction to the circulating maternal antibodies rather than being secondary to the fetal disease

Pulmonary Resection for Tuberculosis—Forty patients with pulmonary tuberculosis were subjected to pulmonary resection on the thoracic surgical service at the New Haven Hospital The two earliest patients had tourniquet and mass ligation of the hilar structures, all subsequent cases were treated by individual ligation techniques A four-rib to 10 rib thoracoplasty usually was performed after pneumonectomy if it had not already been done Streptomycin was given to 33 of the patients 11 of these received it both before and after the resection, the remaining 22 only after the operation One patient had two lobectomies in separate operations, that is, a total of 41 resections was done on 40 patients Twenty six pneumonectomies and 15 lobectomies were done The indications for the resections were failure of thoracoplasty in 13 patients, tuberculous bronchiectasis with or without bronchostenosis in 12, uncontrolled cavitation in eight, tuberculoma in two, suspected tumor in three, and fibrocaseous disease in one In the patient in whom resection was done in 1936 bronchiectasis had been diagnosed, but the resected specimen disclosed tuberculous disease Twelve of the 40 patients had postoperative complications such as bronchopleural fistula, empyema, pulmonary spread, and wound infections Seven of these patients belonged to the group of eight with uncontrolled cavities most of whom had several complications and three of whom died It is felt that pulmonary resection has earned a definite place in the therapy of pulmonary tuberculosis Acceptable indications include thoracoplasty failure bronchiectasis with or without bronchostenosis, chronic empyema with destroyed lung tuberculoma and suspected tumor Because of the unfortunate results of resection in that group of eight patients with uncontrolled cavities, active parenchymal infiltration, and highly positive sputum, it is felt that primary resection is not at present the ideal treatment for such patients

Arterial Hypertension in Unilateral Renal Disease —That unilateral renal disease may cause severe hypertension was established in clinical observations by Ask-Upmark in 1929, before it was experimentally demonstrated by Goldblatt and collaborators in 1934 Many Scandinavian surgeons have found that in some patients only a temporary decrease in blood pressure is obtained by nephrectomy Proper selection of patients for the operation is important The indications for nephrectomy that were established by Schroeder and Fish in 1940 are as follows 1 Arterial hypertension should not have existed for more than two years 2 The renal lesion should be confined to one kidney and should involve diminution of function in that kidney 3 Renal function, as measured by the ability of both kidneys to concentrate urine and by the urea clearance test should be within normal limits 4 There should be no retinopathy and only minimal changes in the caliber of the retinal vessels 5 Arterial pressure should be persistently elevated These criteria were present in the author s patients, a girl 14 with rather severe hypertension and with headaches, vomiting, and dizziness for two years There was no increase in height and weight in this period After removal of a small, atrophic right kidney of a pyelonephritic contracted type the blood pressure fell and remained at normal values (100/70) for two years after the operation simultaneously all the patient's complaints disappeared There was a rapid increase in height and weight This appears to be one of the few cases of unilateral renal disease with arterial hypertension in which nephrectomy has been performed in time to reduce the blood pressure before irreversible changes occurred in the other kidney According to Ask Upmark this disease occurs most frequently in girls and is supposedly due to a congenital anomaly of the right kidney

Isolated Pulmonary Stenosis.—In recent years isolated pulmonary stenosis without other malformations has been recognized more frequently The 21 cases of isolated pulmonary stenosis reviewed were discovered among 250 patients with congenital heart disease Catheterization proved to be the decisive factor in the diagnosis, since it makes it possible to ascertain the type of stenosis whether valvular or infundibular There were 12 males and nine females, the youngest 4 years old and the oldest 38 The complaints were slight, particularly when compared with patients with a combination of pulmonary stenosis and venous arterial shunt Heart symptoms were frequent but generally not incapacitating There were dyspnea occasional palpitations, and precordial pain on severe or moderate exertion The patients were not cyanotic Clinical examination of the heart disclosed bulging of the precordium in about one-fourth of the patients All the patients had a harsh systolic murmur, which, as a rule, was strong, with maximal intensity near the pulmonic area The electrocardiogram in half the patients showed right axis deviation The roentgenological picture was somewhat variable, a prominent second left arch and normal or thin hilar shadows being found in two-thirds of the patients The prominence indicates a poststenotic dilatation This report and other recent reports indicate that isolated pulmonary stenosis is not so rare as it formerly was thought to be Since the present report was completed, the authors have seen 10 additional patients with isolated pulmonary stenosis This brings the total to 31 cases among 340 patients with congenital heart disease

Resection of Thrombosed Section of Artery.—The therapeutic value of resection of a thrombosed section of an artery in disturbances of the peripheral blood circulation is discussed on the basis of observations on 12 patients with impaired circulation of a lower extremity resulting from endangiitis or arteriosclerosis Clinical observations and measurements with the skin thermometer revealed that during arterial resection and for as much as 24 hours afterward the circulation was impaired, particularly in the area of the threatened peripheral portion of the extremity After complete resection of the thrombosed arterial section, measuring from 3 to 35 cm, the circulation briefly improved in four patients, in five the condition became worse, and in three there was no change Four patients required amputation of the thigh A subsequent resection of the sympathetic trunk in four patients produced improvement in the circulation and also in the subjective symptoms in three of them In four patients, in whom a resection of the sympathetic trunk had been ineffective, the arterial resection also had no effect Resection of a thrombosed portion of an artery appears to be of no value in the treatment of impaired peripheral blood circulation of the lower extremity The temporary improvement occasionally observed is probably caused by the wound hyperemia and by the splitting of the constricting vascular sheath and of the adductor canal The theory that vasoconstricting stimuli originate in the thrombosed artery is contradicted not only by the lack of therapeutic response but also by the long-standing bilaterality of the lesion with symptoms occurring on only one side and by the fact that when arterial resection has been ineffective subsequent resection of the sympathetic trunk frequently counteracts the functional spasticity It is assumed that the sympathetic fibers are present chiefly in the peripheral nerves because, if the vasoconstrictor fibers pass through the vascular nerve plexus, then the effect of an intervention on the sympathetic trunk should be limited to the site of arterial resection which is not borne out by clinical observations

Synovioplastic Sarcoma.—Two cases of malignant blastoma are reported, one definitely originating in a synovial bursa and the other in the joint capsule or possibly also in a bursa In both the reticulumlike tumor parenchyma consisted of spindle cells One had clefts with a partially developed endothelium In a review of the literature the authors found that neoplasms of the same matrix have been classified as fibrosarcoma with and without endothelium, sarcoendothelioma and synovioma or 'synovialoma " The authors explain the varied histological manifestations of these blastomas as a result of the peculiar character of the matrix of the synovial tissue, the individual cell of which has been designated as synovioblast They believe that the two blastomas described in their report, as well as those reported in the literature, can be classified in one group and can be designated as synovioplastic sarcoma," in accordance with the nomenclature of mesenchymal malignant neoplasms Microscopic examination is required for correct diagnosis Early surgical treatment is essential

Chronic Erythremic Myelosis G Fradà —p 255

"Nonacute" Hemocytoblastic Leukemia.—The occurrence of 'nonacute' hemocytoblastic leukemia is reported in a woman 43 a man 40, and in a girl 8 The woman had chronic microhemocytoblastic leukemia with mild hyperleucocytosis of 14 months' duration Temperature was normal There were no hemorrhages and no ulcerative necrotic changes in the fauces All of the clinical manifestations, such as asthenia, loss of weight, and hypochondriac pain, were caused by the severe anemia The man had a subacute form of hemocytoblastic leukemia of eight months duration Fever hemorrhages, and ulcerative necrotic lesions of the fauces were observed only in the terminal stage of the disease At this time pronounced hyperleucocytosis was demonstrated while the number of nucleated red blood cells had been normal or only slightly increased during the first months of the disease The girl had a triphasic' form according to Patrassi of six months duration Three stages could be differentiated The first was that of the acute type of leukemia with fever, toxic infection, and ulceration of the fauces The blood picture at this time showed leucopenia and the presence of elements of "lymphoid type, which were probably microhemocytoblasts The second phase was one of remission, and the blood picture was normal In the last stage the disease was acute, exactly as in the first stage, leucopenia and microhemocytoblastic elements were again demonstrated on hematological examination The clinical, hematological, and microscopic study of these three cases confirmed the occurrence of chronic and subacute forms of hemocytoblastic leukemia Massive administration of antibiotics and somewhat cautious administration of sulfonamide compounds is suggested in combination with copious blood transfusions Roentgen therapy seems to exert an unfavorable effect

Hemophilia in the Female —Hemophilia has been regarded as being limited to males, but there is one possible hereditary combination that can give rise to a female hemophiliac that of a male hemophiliac and a female hemophilia-carrier Two earlier investigations one on 600 and one on 75 families, failed to reveal any female hemophiliacs The general opinion has been that the female hemophiliac, if ever conceived dies in utero There are, however, many published reports of females with a hemorrhagic diathesis whose blood-coagulation time was prolonged Other conditions besides hemophilia may prolong the blood coagulation time, but the steps necessary to exclude these conditions have not been taken in recently reported cases of hemophilialike disease in women In the patient whose case is reported here both parents came from hemophilic but unconnected families The various tests on her blood all gave the results expected in hemophilia and the other possible causes of prolonged coagulation time, namely fibrinogenopenia, parahemophilia and the presence of circulating anticoagulants, were excluded The patient had given birth to a healthy female child without at first, excessive hemorrhage During the puerperium severe hemorrhage occurred and hysterectomy was successfully done The authors believe that the operation was justified since the rate of blood loss from the uterine cavity was so great that it would have been difficult to keep pace with it by blood transfusion The regret felt at removing the uterus in a young woman is tempered in this case by the fact that this woman would have been advised against further pregnancies Two points influenced the outcome of the operation favorably the use of interrupted nonabsorbable sutures for the rectus sheath, without which the wound would probably not have healed, and the avoidance of skin piercing sutures through the apertures of which further bleeding would have taken place

Hemopoietically Active Extracts from Feces —Callender and Spray made an extract from the feces of an untreated patient with pernicious anemia and showed that when injected intramuscularly into another patient with untreated pernicious anemia the extract provoked a hemopoietic response The experiment has since been repeated with extracts prepared from the feces of a normal person and of two more patients with untreated pernicious anemia The method of preparation of the nontoxic extract from feces is described From the effects of these extracts and from the growth stimulating actions of the extracts on micro-organisms, it may be concluded that the active principle is vitamin B_{12} As much of this vitamin could be extracted from the feces of patients with pernicious anemia as from those of normal persons, and, though the proportion lost in the process of extraction is unlikely to be constant, it seems that there is no significant difference between the amounts excreted by the two types of subject

Use of Epinephrine Test in Rheumatoid Arthritis —Epinephrine tests according to the Thorn method with minor modifications were performed on 51 patients with rheumatoid arthritis The full test, including the response of the total number of leucocytes, the neutrophil cells, lymphocytes, and eosinophil cells is time consuming It was carried out in only 34 of the 51 patients, while the eosinophil cell response was determined in all patients The typical response to epinephrine in normal persons consists of an increase in the total leucocyte count and in neutrophil cells an increase then a decrease in lymphocytes and a greater than 50% decrease in the number of eosinophil cells, also after an increase Of the 51 patients, seven failed to show the normal eosinopenia and therefore failed to produce adequate cortisone secretion in response to epinephrine This would contraindicate its therapeutic use in such cases Patients who fail to respond to epinephrine stimulation given for therapeutic reasons three or four times a day should respond to cortisone This test may therefore be valuable in the selection of patients for epinephrine stimulation or cortisone therapy Most of the patients with chronic rheumatoid arthritis responded normally to epinephrine, and would thus seem to have normally reacting hypothalamic pituitary adrenal cortex systems The fact that epinephrine can produce peripheral blood changes similar to those produced by cortisone, namely, lymphopenia and eosinopenia and that it causes an increase in the size of the suprarenal cortex gives its therapeutic use a sound scientific basis Pre-epinephrine lymphocytosis was observed in 13 of those patients for whom a full differential leucocyte count was performed The presence of enlarged lymph nodes in Still s disease and frequently in adult rheumatoid arthritis, as well as lymphocytosis suggests a mild degree of so-called status thymicolymphaticus

Tropical Eosinophilia and Filariasis.—In a woman living in Sumatra tropical eosinophilia developed Living Microfilariae malayi were detected in the puncture fluid from a varicose lymph node cyst The disorder did not respond to treatment with penicillin or neoarsphenamine, but it temporarily improved following intravenous administration of tartar emetic (antimony potassium tartrate) and cure followed treatment with antimony sodium thiomalate (anthiomaline®) The authors review the literature on tropical eosinophilia, which was first described in 1923 by de Langen and Djamil, who noticed the concurrence of increased temperature and enlargement of spleen with high leucocyte and eosinophil counts in patients in the Netherlands East Indies In 1928 de Langen described more cases of this type and subsequently cases were reported by several other authors Weingarten in 1943 reported what he termed tropical eosinophilia in 81 patients whom he had observed in British India After Weingarten s report several other observers reported similar cases In 1939 Netherlands investigators in the East Indies observed that high eosinophilic counts occurred in patients in whom lymph nodes were found to contain microfilariae Thus there seems to be an etiological connection between tropical eosinophilia and filariasis

High Blood Pressure —In a patient with high blood pressure the case must be investigated thoroughly before treatment is begun The level and variations of blood pressure must be determined, and the capacity of the patient's arteries to withstand prolonged strain, the rate of progress of the hypertension and the amount of damage already done to heart, kidneys, and brain must be estimated Hypertension will persist throughout the patient's life and is usually slowly progressive Chisholm discusses various treatments He feels that it is almost impossible to obtain an unbiased opinion of the efficacy of sympathectomy in severe hypertension The indications for operation vary from one clinic to another The best results appear to be obtained in early cases of malignant hypertension There is no doubt that good results have been obtained with sympathectomy in a few cases Methonium treatment offers new hope in severe and rapidly progressive cases of hypertension The author believes that there is a large field for combined treatments, such as low salt diet and methonium, which act synergistically

*Benign Ulcer of Esophagus L Leger M Gaultier, I Bertrand and P Masse —p 944

Benign Ulcer of Esophagus.—The occurrence of a benign ulcer of the esophagus is reported in a man, 43 The patient complained of dysphagia associated with regurgitation and occasional vomiting, in which no blood was ever demonstrated There was no pain or weight loss Esophageal stenosis was demonstrated on repeated roentgenographic examination The stricture was in front of the seventh dorsal vertebra and was associated with moderate dilatation of the esophagus above and below the lesion A small, round niche was observed immediately above the stricture, notching the right posterior aspect of the esophagus Three biopsies were made with the aid of the endoscope, and two of them revealed an inflammatory condition of the mucosa, while the third showed cryptic cylindric mucosa Esophagectomy was performed, and continuity was reestablished by esophagogastrostomy Heterotopic gastric mucosa and, in addition, fragments of pyloric and duodenal mucosa in the esophagus were demonstrated microscopically It is suggested that the development of the ulcer depended on this heterotopia by some kind of autodigestion Recent studies seem to indicate an increased incidence of benign ulcer of the esophagus, which has usually been considered a rarity Clinical diagnosis has been based on pain, dysphagia, regurgitation, and hemorrhage, pain is of great diagnostic value, but may be absent as it was in the authors' case The presence of a niche on roentgenographic examination and the results of biopsy performed after endoscopic examination will establish the diagnosis of esophageal ulcer The authors do not formally deny the concept that the ulcer of the esophagus may be the result of the digestion by acid gastric juice to which the esophageal mucosa may be subjected, but they do not believe that this process is responsible for all cases The possibility of a short esophagus should be considered, and one should determine the exact location of the ulcer, for which the term ectopic ulcer of the stomach may sometimes be more appropriate than that of ulcer of the esophagus Associated conditions, such as gastroduodenal ulcer or cholecystitis, should be watched for Gastric acidity tests should be performed, and the effect of intensive treatment with atropine on the spasm, the stenosis, or the ulcer should be studied Benign ulcer of the esophagus may take a fatal turn when allowed to progress but with early diagnosis recovery will follow adequate medical and/or surgical treatment

*Results of Investigations of 81 Patients Treated for Tuberculosis of Foot M C Wilkinson —p 475
Early Changes of Kienböck s Disease of Carpal Lunate Bone F C. Durbin —p 482

Tuberculosis of the Foot —Wilkinson reviews observations on 81 patients with tuberculosis of the foot who were observed between 1931 and 1950 The diagnosis rested chiefly on clinical and radiological evidence, but in 48 patients there were associated tuberculous lesions, and in 50 there was, on admission a cold abscess associated with the bone disease Microscopic examination was performed only in 10 patients, results were positive for tuberculosis Patients whose diagnosis was uncertain were excluded The astragalus was the bone oftenest affected Tuberculosis of the astragalus was usually associated with tuberculosis of the ankle joint and sometimes also with tuberculosis of the subastragaloid joint Tuberculosis of the midtarsal bones was next in order of frequency Most of the patients during the early period received only constitutional treatment A combination of constitutional treatment and operation was used during later years In a third group constitutional treatment was combined with streptomycin, and surgical treatment was added in some of these The author feels that constitutional treatment remains the basic treatment of the severe form of systemic tuberculous disease of which tuberculosis of the foot is a manifestation, that the results can be greatly improved by operation on tuberculous bone, and that streptomycin is a valuable ancillary form of treatment Constitutional treatment requires a long time (average of 3 2 years), but the results are good The advent of antibiotics has not in the author s opinion, altered the fundamental need for constitutional therapy in the treatment of skeletal tuberculosis

Waterhouse Friederichsen Syndrome —Mariño Gallego reviews the literature and reports on 15 children with Waterhouse-Friederichsen syndrome ranging in age from 17 days to 8 years, eight being less than one year old Nearly three fourths of the patients were males The onset is usually sudden, the condition appearing extremely grave from the first hours The most constant symptoms were high fever, lividity, cyanosis, particularly of hands and nails hypotension, weak cardiac sounds, tachycardia semicomatose state petechiae spreading rapidly all over the body hypothermia of the extremities, tachypnea, and pain elicitable by palpation of renal areas The striking contrast between cold extremities and the high temperature in abdomen and head is an early sign and an aid in diagnosis There was a high potassium level, normal blood sugar, and severe anemia with leucocytosis, lymphocytosis, neutropenia, and shift to the left Blood culture was done in four cases, only one culture yielding meningococci Bacteriologic examination of the petechiae gave negative results in the two cases in which it was performed Treatment must be begun quickly The condition was so grave and the vascular collapse so severe in some of these patients that treatment could not be as rapid and complete as was desirable All patients were given heat in moderate form, oxygen, and cardiovascular stimulants administered centrally as well as peripherally Hypertonic solution of sodium chloride, blood, or plasma were given when possible Sulfonamides were given by mouth when possible or intravenously or intrathecally when signs of meningitis were present Penicillin, because it was difficult to obtain, was given only to some patients Despite early treatment, no cure was observed Death occurred within six to 50 hours after onset of the disease Necroscopy was performed in eight patients The capsules of the adrenals were found greatly increased in size and weight in every case and had a hemorrhagic and more or less necrotic aspect Meningitic lesions were observed in two cases

Allergic Reactions to Penicillin and Streptomycin.—Allergic reactions in 53 patients treated with penicillin and in seven patients treated with streptomycin are reported on Only two of the patients with allergic reactions to penicillin had been treated previously with penicillin, in all the others the allergy became manifest during the first short course of treatment with penicillin, most frequently about the 10th day after the first injection The seven patients with allergic reactions to streptomycin were nurses who had been in contact with the drug for some time Reactions suggesting general sensitization occurred in 37 of the 57 patients treated with penicillin In 28 these reactions were urticarious, seven patients had noncharacteristic eruptions, three had mycidlike eruptions, and six had reactions suggesting general sensitization associated with mycidlike eruptions and/or eczema The occurrence of mycidlike eruptions suggests that the antibiotics that are products of fungi may cause reactions in man similar to those that occur spontaneously in persons who are carriers of skin fungi and have been sensitized to their products Of 25 patients with penicillin allergy, 23 gave a positive reaction to intracutaneous tests with trichophytin, while only 12 gave a positive reaction to intracutaneous tests with penicillin Of 30 patients with mycosis who gave positive reactions to trichophytin tests, five also gave positive reactions to penicillin tests The increased incidence of allergic reactions to antibiotics suggests that in the future the following rules should be observed 1 Boils, simple pyoderma, and doubtful febrile conditions of short duration are not to be considered as indications for treatment with penicillin 2 Special caution is indicated for patients with mycotic infections, particularly during the summer months 3 Previous occurrence of allergic manifestations following the application of antibiotics should caution against repeated treatment, particularly in patients who have had urticarious manifestations These patients should first be given a small dose of the antibiotic to detect an occasional severe hypersensitivity

Simple Microchemical Demonstration of Barbiturates for Clinical Purposes H Kresbach and H Gomahr —p 476

General or Local Anesthesia in Tonsillectomy in Adults —From 25 years of experience, the author has become convinced that general anesthesia has many advantages over local anesthesia in tonsillectomies performed on adults Following are some of these of general over local anesthesia 1 The postoperative reaction of the wound niches and of their closest surroundings is always less, and the postoperative pains are also less severe and of shorter duration Absence of the tissue damaging effect of procaine hydrochloride probably explains both those factors 2 If tonsillar stumps are to be removed, or if a peritonsillar abscess has existed, the operation should always be done with the patient under general anesthesia, because first, the edema produced by the infiltration may cover up small remnants, and, secondly, uniform distribution of procaine hydrochloride is impeded by scars 3 The technique of tonsillectomy is greatly facilitated by complete exclusion of reflexes and by the relaxation of the tissues The operative field is not only painless, but also, because of absence of pressure, almost bloodless, and thus a better survey is provided and there is less likelihood that tonsillar remains are left behind, so that the undesirable after-effects that may result from this are thus avoided 4 The local inflammations sometimes produced by procaine hydrochloride and the possible severe complications resulting from them are avoided In the presence of heart disease tonsillectomy with the patient under general anesthesia is less taxing for the patient than with local anesthesia, because in the latter case the excitement may prove harmful Of course, in the presence of serious heart lesions the heart must be properly prepared for the operation 5 Many observers have found that pulmonary complications are much less frequent when tonsillectomy is done with general rather than with local anesthesia

BOOK REVIEWS

Diseases in Old Age A Clinical and Pathological Study of 7941 Individuals Over 61 Years of Age By Robert T Monroe M D Harvard University Monographs in Medicine and Public Health No 11 Cloth $5 Pp 407 Harvard University Press Cambridge 38 Mass Oxford University Press Amen House Warwick Sq London E C 4 1951

This monograph is a report on a clinical, pathologic and therapeutic survey of the records of all patients over 61 years of age on the medical service of the Peter Bent Brigham Hospital from its opening in March 1913 to March 1943 It includes a consideration of the social and economic problems posed by illness of older people The survey includes the records of 7 941 patients (4,088 men and 3 853 women) Among these there were 1,874 deaths, with autopsy data on 1,171

The first of the 14 chapters presents a review of the general features of the group the 13th chapter is a summary of the medical findings and the last chapter deals with a discussion of the community facilities essential for old people The other 11 chapters deal with diseases of organ systems, nutritional disorders and alcoholism, malignant diseases and venereal diseases

The organization of the geriatrics clinic at the Peter Bent Brigham Hospital is described together with a statement of the basic needs and instruments required for the successful operation of such a clinic

The author states that three fourths of the men and two-thirds of the women claimed general good health throughout their lifetime there is no evidence of a particular constitution predicating the likelihood of one s reaching old age

Considerable space is given to the discussion of cerebral arteriosclerosis heart disease, arthritis and digestive disturbances, as these present peculiarities in older persons Malnutrition and psychoneurosis are prominent features among the patients

Although a major portion of the text is devoted to analysis of the records studied, the author projects the clinical experience gained from the operation of a geriatrics clinic to emphasize particular considerations of important pharmacological principles and therapeutic programs required in the clinical management of older patients

A feature of the monograph that deserves special mention is a discussion of social and economic forces that influence emotional situations and difficulties in adjustment among apparently well but obviously ill, aging persons Suggestions for steps to be taken by communities to cope with these situations are outlined

It is interesting to note the change in employment status of older men over the 30 year interval covered by the study In the decade of 1913 1923, 92 4% of men age 61-65 were gainfully employed, in the decade of 1933-1943, 66 7% were employed Also employment was more numerous up to the age of 80 in the first 10 years than in the last 10 The men who retired at age 61-65 trebled in the 30 year period

It is indicated that there is a growing burden on the hospital imposed by sickness in old age In 1913, one in every 16 admissions to the medical service was over 61 while in 1943 one in every five admissions was over 61 This is an increase of 200% in 30 years and is considerably greater than the increase in the number of persons over 61 in the general population

If the situation in the Peter Bent Brigham Hospital is typical, general hospitals today have 20% to 30% of their beds occupied by patients who are over 61 years of age That is a concentration several times what it is in society at large When one considers that new hospital construction now costs from $10,000 to $25,000 per bed and the daily per capital cost of care is $12 to $18 a day the question is raised as to the need for hospital beds for these older people whose conditions could be handled well elsewhere The author reviews the available nonhospital facilities for the care of the aged, notes their inadequacies, and makes suggestions for the organization of old age centers

This documented book relating actual clinical experience is most timely and should find a large group of readers among the medical profession Implicit in the presentation is that medicine must take its proper place among the social sciences in addition to maintaining its established place among the natural sciences

Diseases of the Endocrine Glands. By Louis J Soffer M.D F.A C P Associate Attending Physician and Head of Endocrine Research Laboratory and Clinic Mount Sinai Hospital New York City With assistance of J Lester Gabrilove M D Research Assistant, Endocrine Research Laboratory and Clinic Mount Sinai Hospital New York City With section on Carbohydrate Metabolism Hypoglycemia and Diabetes Mellitus by Henry Dolger M D and section on Gonads by Arthur R. Sohval M.D *Cloth $15 Pp 1142 with 91 illustrations Lea & Febiger 600 S Washington Sq* Philadelphia 6 1951

This book is intended according to the author s preface, "to bring together our present knowledge ' in endocrinology The author has been assisted by Dr Sohval, who has written the section on the gonads (pp 407 688), and by Dr Henry Dolger, who has written the section on diabetes, hypoglycemia, and hyperinsulinism (pp 903 1077) The authors unfortunately have failed to correlate the basic principles of the subject with its clinical applications in a manner that would please either the student or the general practitioner desirous of specific practical information The book impresses one as having been put together from accumulated notes on various topics without respect to their relative merits or importance and without organization or coherence For example, after devoting over a page to the toxic effects of thiouracil (which has been largely replaced by its derivative), only a short paragraph is devoted to the more important propyl thiouracil The treatment of Addison's disease, to quote a second example, although given in some detail, is so vague and repetitious as to leave doubt in the mind of the reader as to the exact manner in which the various procedures described are to be utilized Over a page is devoted to The Treatment of Addison's Disease with Transplantation of Adrenal Tissue," a procedure that is certainly far from established, as the author himself notes The illustrations which are too few for a good textbook, are in many cases non endocrinological (e g , Fig 8 of an achondroplastic dwarf, Fig. 61 of ectodermal dysplasia) or too poor (e g Fig 38, 82, and 88) to illustrate the points emphasized On the credit side, it may be said that the material included is voluminous, up to date and well documented by exhaustive references to the literature It is regrettable that the authors failed to digest the sound material which they undoubtedly have at their disposal and present it in a more literary and scholarly manner essential in a good textbook

Genetics in the 20th Century Essays on the Progress of Genetics During Its First 50 Years. Edited for Genetics Society of America by L C Dunn Professor in Columbia University New York. Cloth. $5 Pp 634 with illustrations. The Macmillan Company 60 5th Ave. New York 11 1951

This book consists of a series of papers presented at the Golden Jubilee of Genetics held under the sponsorship of the American Institute of Biological Sciences of which the Genetics Society of America is a member The meeting celebrated the 50th anniversary of the rediscovery of Mendel's work which led to the founding of the science of genetics The essays, contributed by 26 American and foreign authorities, trace the development of genetics during the past half-century and survey its actual and potential contributions to human welfare in such varied fields as cancer, disease resistance plant and animal breeding and plant pathology This volume can be recommended for those interested in obtaining a comprehensive view of the astonishing advance made in this specialty during the comparatively short span of 50 years

---

The reviews here published have been prepared by competent authorities and do not represent the opinions of any official bodies unless specifically stated

Angewandte und topographische Anatomie Ein Lehrbuch für Studierende und Ärzte. Von Gian Töndury ordentlicher Professor der Anatomie an der Universität Zürich Cloth 70 marks $16 65 Pp 416 with 369 illustrations. Georg Thieme Verlag Diemershaldenstrasse 47 (14a) Stuttgart-O agents for U S A Grune & Stratton Inc 381 Fourth Ave New York 16 1951

This book on applied and topographic anatomy is divided into three major parts, namely, the torso the head and neck, and the extremities The author has attempted to keep the work practical and applicable for both undergraduate and postgraduate students of medicine and surgery He rightfully stresses the importance of embryology and emphasizes the thought that this is the logical approach to understanding complicated adult anatomy He has, therefore, started each chapter with a short section pertaining to the embryology of the given region to be discussed The illustrations are well done and are closely correlated to the text The author mentions the importance of three-dimensional illustrations, however, this thought could have been carried out to a greater degree Wherever possible, roentgenograms have been added to stress certain anatomic relationships The commoner anomalies are described adequately, and the possible explanations for their existence are given in the discussions under embryology The pen and ink drawings on regional lymph nodes and lymph drainage are depicted in simple and refreshing style helped by the use of arrows showing the drainage to a group of given nodes In Fig 117, on page 130, it would have been well to label the posterior cecal artery, since it is the branch herein depicted that gives rise to the appendical artery Fig 279 on page 299, represents the time honored diagram revealing a complete capsule surrounding the thyroid gland In the light of present knowledge this would not be considered correct, since the illustration fails to show the attachment of the pretracheal layer of deep cervical fascia to the thyroid gland

The material has been presented well, showing good planning and excellent cooperation between the author and the artist The paper is good, the binding sturdy, and the print legible It can be recommended as a good collateral volume for anyone who is interested in anatomy and who can read German

Help Yourself Get Well A Guide for TB Patients and Their Families By Marjorie McDonald Pyle M D With foreword by H Corwin Hinshaw M.D Clinical Professor of Medicine Stanford University School of Medicine San Francisco Cloth $3 Pp 235 Appleton-Century-Crofts Inc 35 W 32nd St New York 1 1951

This small book contains a personal message of advice and encouragement to all victims of tuberculosis, but especially to the patient who has just been told that he has tuberculosis The author is well-qualified to give this advice She is a physician and scientist and has been a patient She writes with the sympathy and insight of a fellow sufferer but with the objectivity and medical accuracy that stems from her scientific background and what she writes is readable She leads the new patient through the various periods of adjustment in this chronic disease the initial acceptance of the diagnosis the development of faith in the physician, the acclimatization to the sanatorium and its routine, the maintenance of morale, the planning for rehabilitation and the avoidance of relapse on returning home A program of occupational therapy and amusement for the bed patient is outlined The book is recommended as a valuable prescription for the patient with tuberculosis, and many of its features will be of help to patients with other chronic diseases

Low Sodium Diet: A Manual for the Patient. By Thurman B Rice A.M., M D Professor of Public Health Indiana University School of Medicine Indianapolis, Indiana. Cloth $2 75 Pp 103 Lea & Febiger 600 S Washington Sq Philadelphia 6 1951

This book, written for patients, describes in detail the preparation of low sodium diets The author is an epicure at heart for he takes great care to make the diets palatable therein lies much of the importance of the book

While the format of the book is pleasing it would seem that it could have been less expensive and more convenient if blank paper had been used less extensively The author justifies his claim in the preface that he has had a large experience in writing for laymen The book can be recommended as among the best of the manuals for the patient s use

Pharmaceutical Botany By Heber W Youngken Ph M Ph D Sc D Professor of Biology and Pharmacognosy Massachusetts College of Pharmacy Boston Seventh edition Cloth $7 Pp 752 with 548 illustrations Blakiston Company (Division of Doubleday & Company Inc.) 1012 Walnut St Philadelphia 5 1951

The new edition of this textbook has been revised to include more information on general botany without the reduction of material on pharmaceutical botany A new chapter on metabolism has been added

The opening chapters are concerned with the morphology of the vegetative structures, followed by the chapter on metabolism and then three chapters on the morphology of the reproductive structures of plants There are single chapters on plant environment, plant anatomy, and genetics and evolution

A chapter on taxonomic principles introduces several chapters devoted to discussion of plant classes Throughout the text, tables are included indicating the drugs occurring in different plant families, the genus and species names from which the drugs are obtained, the parts of the plant which yield the drugs, and the habitat of the plants In the chapters on monocotyledons and dicotyledons, only the drug bearing plants are discussed

Appendix 1 is a 10 page discussion of the microscope, its component parts, use, and care Appendix 2 is concerned with histologic technic There is a 40 page glossary, which is a welcome feature Just before the very detailed index is a classified list of reference works

The physician interested in botany and in plant origin of drugs would appreciate this book, but it is emphasized that this is primarily a textbook and only secondarily a reference source

Nerve Impulse Transactions of the First Conference, March 2-3 1950 New York, N Y Editor David Nachmansohn Cloth $3 Pp 159 with 4 illustrations Josiah Macy Jr Foundation 565 Park Ave New York 21 1951

This monograph has been prepared by five authors in as many chapters Harry Grundfest, J H Ivastel, C Ladd Proser, David Bodian, and Henry B Steinbach These chapters deal with electrophysiology, biochemistry, comparative physiology, histology, and ion exchange and permeability

This is the unindexed stenographic report of the conference with the free exchange of opinions and ideas, the interruption of the speaker with questions and often digression into rather distant, though related fields Undoubtedly there is some merit in such a presentation It permits the reader to gain the flavor of the conference, to become a vicarious participant, to a limited degree However, there is no merit in also giving the reader so complete an insight into the colloquialisms of each of the participants, into their variable ability to speak grammatically and express their thoughts syntactically In fact, the ungrammatical expressions, the ambiguity, and the lack of good organization are at times appalling and greatly confuse the reader It is to be regretted that so much money was expended in such excellent press work and binding with so little attention to clarification of the various speakers statements

An Atlas of Anatomy by Regions Upper Limb Abdomen, Perineum, Pelvis, Lower Limb, Vertebrae, Vertebral Column, Thorax, Head and Neck, Cranial Nerves and Dermatomes. By J C Boileau Grant, M C M B Ch B Professor of Anatomy in University of Toronto Toronto Third edition Cloth $12 With 637 plates Williams & Wilkins Company Mount Royal and Guilford Aves Baltimore 2 1951

More than 70 new illustrations have been added to this edition, and 28 old illustrations have been replaced or improved The regions of the body are shown in plastic drawings based on photographs of anatomic dissections with special emphasis on the topographical relation of the various structures Colors added to most of the halftones help to draw attention to details which are concisely discussed in brief legends The Atlas will be used profitably by the student of anatomy together with a more detailed textbook The interest of the clinician will be stimulated by perusal of the beautiful plates and schemes for an always needed brush up of basic anatomic relations More representative illustrations of the brain and its related structures should be added The present grouping The Head and Neck might better be separated into one part, on the head with more emphasis on the brain and another part combining the neck and the back

This atlas has proved its usefulness, is very reasonably priced, and is highly recommended

Lehrbuch der Histologie und der mikroskopischen Anatomie des Menschen Von Philipp Stöhr Jr Professor der Anatomie und Direktor des anatomischen Instituts der Universitat Bonn Cloth 66 marks Pp 528 with 510 illustrations Springer Verlag Reichpietschufer 20 Berlin W 35 *(West Berlin) Neuenheimer Landstrasse 24 Heidelberg Göttingen 1951*

This textbook on histology presents in a relatively small space a wealth of information, comparable to that found in the standard American textbook The material is well-organized, and the style is clear References are omitted There is a large number of excellent illustrations, partly photomicrographs and mostly drawings, many in color The great majority of the illustrations are original, with the exception of the useful three-dimensional drawings of Braus, which assist greatly in the plastic understanding of the topographic relations However, not only the illustrations should make this new German textbook interesting to the American reader, but also the extensive discussion that the nervous system and especially the peripheral nervous system and the terminal nerves in the various parenchymal organs receive These aspects are especially well-illustrated This emphasis on the nervous system is not surprising, in view of the great interest that the autonomic nervous system and its abnormalities are receiving in Germany The author himself has markedly stimulated this interest by his previous work In the discussion of the functional significance of the structure more emphasis is given to the tissues as a whole than to the cells as individual units, a tendency that is again related to the emphasis on the innervation of the tissues or organs In the foreword, synthesis in the histological study is emphasized in contrast to the analytic dissection It is indeed an esthetic pleasure to look through this elegant book

Radiochemical Studies: The Fission Products. Edited by Charles D Coryell Department of Chemistry and Laboratory for Nuclear Science and Engineering Massachusetts Institute of Technology Boston and Nathan Sugarman Institute for Nuclear Studies and Department of Chemistry University of Chicago Chicago Book 1 Parts I II III IV—Papers 1 to 52 Book 2 Part V—Papers 53 to 199 Book 3 Parts V (cont) VI VII VIII—Papers 200 to 336 National Nuclear Energy Series Manhattan Project Technical Section Division IV—Plutonium Project Record Volume 9 Cloth $18 50 Pp 516 517 1315 1316-2086 with illustrations. McGraw Hill Book Company Inc 330 W 42d St New York 18 Aldwych House Aldwych London W C.2 1951

These three volumes, though essentially chemical in content, combine the fascination of a detective story with that of a necropsy for they describe the means used to identify what remains after uranium nuclei have been disrupted by fission, whether in an atomic bomb or in a chain-reacting pile In 336 papers and four appendixes, the technics and results of these identifications are given In Paper 185 for example, Newton, Kant, and Hein review certain facts suggesting the presence of an isotope of praseodymium the necessary chemical work then proceeds according to plan, and it yields a substance with a half life of only 17 5 minutes Although the quantity is small, it suffices to establish the properties of this evanescent material

This new chemistry has opened up enormous fields of research, and it will be a long time before all the possible applications in medicine can be explored Adding to the interest of these volumes is the description (Paper 33) of a laboratory for high radioactivity, with several photographs showing the devices whereby the handling and storing of dangerous fission products has so far been accomplished with amazingly few mishaps

Advances in Biological and Medical Physics Volume II Edited by John H Lawrence and Joseph G Hamilton Cloth $7 80 Pp 348 with illustrations Academic Press, Inc 125 E 23rd St New York *10 1951*

Like its predecessor, this second volume on advances in biological and medical physics is concerned chiefly with applications of nuclear physics in the medical sciences The biological effects of radiations, in particular the carcinogenic effects, are summarized in the light of recent work. Experiments with radioactive forms of carbon, sulfur, iodine, sodium, phosphorus, and iron are reported, and the possibilities of fruitful research on such vexing problems as atherosclerosis are sketched The book does not contain anything of immediate practical interest to the physician, and even a reader with some knowledge of mathematics will be alienated by the peculiar notations exemplified on pages 54 and 55 The work as a whole, however, is the result of profound scholarship and a most valuable contribution

A Handbook on Diseases of Children, Including Dietetics & the Common Fevers By Bruce Williamson M D F R.C P Physician, Children s Dept., Royal Northern Hospital London Sixth edition. Cloth $4 50 Pp 440 with 94 illustrations Williams & Wilkins Company Mount Royal and Guilford Aves. Baltimore 2 1951

This book fills a definite need for a small but authoritative work on the diseases of children for the desk of the general practitioner or others who have an interest in, but not a specialized knoweldge of, the subject The author covers the important aspects of pediatrics in a well written and concise fashion.

Suggested methods of therapy are completely up to-date The illustrations do not compare favorably with the excellence of the text Some are obviously old, and the photographic technique is frequently poor In view of the great importance of malignant lesions as a cause of death in childhood, it is felt that they are given inadequate space in this volume There are other debatable points, such as the importance of status thymicolymphaticus as a cause of death However, in general, this is at present the best handbook on the subject of diseases of children on the market today

La tiroides y sus enfermedades: Publicación del Massachusetts Gener Hospital Por J H Means M D *profesor de la Clínica médica de* Universidad de Harvard Boston Traducción [de la segunda edición e *idioma inglés] de los doctores* Carlos Galli Mainini y Arturo Oñativi Cloth. $180 (Argentine) Pp 614 with 61 illustrations. Ediciones Artecn'c Venezuela 1702, *Buenos Aires* [1951]

The translation of this excellent book should be gratefull accepted by every physician of the Spanish speaking countrie as it represents the magnificent work done by Dr Means at th Thyroid Clinic at Massachusetts The thyroid—its hormone anatomy, physiology, pathology, and relations to other endocrine glands—is discussed in detail and with simplicity an *authority The chapters* are well organized, each ending with helpful résumé and a very extensive bibliography The 31 chapters completely cover every aspect of the thyroid and its diseases

The translation is exceptionally good and the reader has th impression of reading an original instead of a translation Then are few typographical errors for a book of this size, and these are minor

The Housefly: Its Natural History, Medical Importance, and Control *By Luther S West Professor and Head of Department of Biology* Northern Michigan College of Education Marquette Cloth $7 50 Pp 584 with 177 illustrations. Comstock Publishing Co Inc 124 Roberts Place Cornell Heights Ithaca N Y 1951

This is the first comprehensive book on the housefly that has appeared in nearly 40 years The author has summarized the practical points of the older books, together with the vast amount of material that has been published since that time Factors having to do with the life history and breeding of flies are given in detail Many practical suggestions are included in the chapter on public health relations, while a long list of human diseases that flies may possibly transmit is presented The newer insecticides are discussed, with emphasis on the fact that they have not entirely solved the problem, since new generations of houseflies develop a resistance to the insecticide Thus, the older methods of control cannot yet be discarded

Cold Spring Harbor Symposia on Quantitative Biology Volume XV Origin and Evolution of Man Cloth $7 Pp 425 with illustrations. Biological Laboratory *Cold Spring Harbor L I New York 1950*

The present volume consists of a series of papers dealing with the evolution of man with emphasis on the origin of the human stock and the problems of human racial differentiation The symposium represents a collaborative study between geneticists and physical anthropologists and will therefore be of particular interest to workers in these fields The practicing physicians, however, should find much of interest in the contributions dealing with the frequency, extent, and genetic determination of various specific characters that may be of racial significance Included in these papers are a report by Neel on the population genetics of thalassemia and of sickle cell disease, a discussion on the inheritance of blood groups by Race, and a review by Boyd of the traits that can be used in population genetics

QUERIES AND MINOR NOTES

IRRADIATION OF PLASMA

To the Editor —*Please give information about the proved value of irradiation of plasma to a county (population 150-000) blood bank Is it worth $1 600?*

Stuart B Blakely Binghamton N Y

Answer —It is inadvisable to use plasma without subjecting it to ultraviolet irradiation by an approved and tested machine, because of the risk of virus hepatitis It is another question whether the installation of such equipment is economically feasible A community of 150,000 persons may require between 400 and 800 units of plasma annually This amount would justify the purchase price of the machine However, a greater problem is that of having an expert technician to operate and maintain the irradiating equipment If such a skilled person is not available an irradiation installation is not wise

DIAGNOSIS OF PREGNANCY

To the Editor —*How soon after the last menstrual period does a series of three daily injections of neostigmine have significance in the diagnosis of pregnancy?*

J G Bradford M D Montesano Wash

Answer —Three daily injections of neostigmine given about five weeks from the beginning of the last menstrual period will yield a presumptive diagnosis of pregnancy in perhaps 60 or 70% of the cases However, it will yield a far higher incidence of accuracy when given about six weeks from the beginning of the last menstrual period In other words, the test is far more accurate when employed about two weeks after a missed menstrual period

BLUE NEVI

To the Editor —*I would like information regarding blue nevi I have under observation a white woman 36 who gives a history of dermatitis on the left upper arm since she was about 12 This remained static until 1949 when some acceleration of growth was noted A similar acceleration occurred in 1950 with numerous blue black macular to shotty lesions over the outer and upper two-thirds of the left arm and shoulder Intermingled with these are the brownish pigmented macules of the common variety of nevus Reports of two biopsies were blue nevus with no evidence of malignancy '*

William B O Connor M D , St Joseph Mo

Answer —Blue nevi are benign lesions and are no more prone to become malignant than are other nevi When one begins to change in character, either in its size or color a histologic examination should be made of it, for there have been a few cases recorded in which melanoma developed after irritation

LIE DETECTOR TESTS

To the Editor —*Is the lie detector test accepted as reliable and scientific by the medical profession? If not what are the specific reasons for its unreliability?*

M D Maryland

This inquiry was referred to two authorities whose respective replies follow —Ed

Answer —The answer to this question necessarily refers only to those members of the medical profession who have had experience and training in the lie detector' technique Several different types of apparatus are manufactured that are classed as lie detectors Those considered most reliable by specialists in this field are instruments that simultaneously record on a moving strip of paper the rhythm and depth of respiration, the pulse rate and blood pressure, and the resistance of the skin to the passage of a weak current of electricity, which is known as the electrodermal response These physiological phenomena are recorded during a period when no questions are asked the subject and also during the time when he is being interrogated on both relevant and irrevelant questions The apparatus records with a high degree of accuracy changes that occur during this period of questioning

The interpretation of the completed graph is the key to the success of the lie detector technique, and, in that, it is akin to the interpretation of x rays, electrocardiograms, and other scientific tests that detect abnormal physiological responses Consequently, the training, experience, and integrity of the operator who diagnoses the completed graph is of paramount importance in evaluation of the reliability of his interpretation

This apparatus and technique has now been tested by experience in thousands of cases for over a quarter of a century Conducted by a qualified operator this technique for detecting deception has demonstrated a reliability comparable to most physiological examinations that are widely accepted by the medical profession The nature of the examination itself precludes an accurate estimate of the percentage of failures, but, based on the large number of cases in which subsequent events proved or disproved the lie detector diagnosis, the percentage of error is low Among members of the medical profession experienced in this field, the lie detector test is accepted as scientific and as a valuable means of differentiating truth from falsity

Answer —No simple answer can be given to this query as it is worded There is not one lie detector test but several, and there are not reasons for its unreliability but conditions under which it should not be used and cautions to be observed in interpreting the results Lie detectors that provide tracings of blood pressure, respiration, muscular movements, and skin resistance have a sound physiological basis They also have a far sounder psychological basis than the infinite variety of cruelties" used in the past which 'were only uniform in expressing the frustration felt by the prosecutor and police " A simple control procedure can be used to preclude the possibility that idiocy, emotional indifference or delusional states might affect results Other precautions that must be taken and limitations to be expected have been set forth in recent (1950) articles by Floch and by Inbau (J Criminal Law and Criminology) Probably many physicians today will agree with the opinion recorded by Le Moyne Snyder (*Ann Int Med* 18 551 [April] 1943) that ' interrogation by means of the lie detector provides a scientific humane and highly accurate adjunct to criminal investigation '

DECIDUOUS TEETH

To the Editor —*We know that the deciduous teeth should be left in as long as possible If these teeth are down to mere shells and not infected and not painful, are they of value in guiding the permanent teeth and saving space for them or should they be pulled to avoid danger of infection?*

Jackson Herbert M D , Portsmouth Ohio

Answer —The pulp of an actively carious tooth is always in danger of infection If there is no dentist available to remove the decay and restore the crown extraction may be considered with the realization that loss of space may result Ideally, these teeth should be restored by the use of shell crowns so that the crown will serve in mastication and in guiding the permanent successors into correct positions If the crown is not restored, these teeth act only as partial space maintainers If the tooth is extracted and no space maintainer is inserted, the space will be closed in the posterior region of the mouth Therefore, the best procedure is restoration of the crown

---

The answers here published have been prepared by competent authorities. They do not however represent the opinions of any official bodies unless specifically stated in the reply Anonymous communications and queries on postal cards cannot be answered Every letter must contain the writer s name and address but these will be omitted on request

SYPHILIS AND PREGNANCY

To the Editor —*A multipara five months pregnant has a strongly positive Wassermann test She is in good health and has no clinical signs of syphilis In 1941 she gave birth to a normal baby a blood test was not taken, and there is no record of a cord Wassermann test In 1943 she again gave birth to a normal baby and there is no record of a blood test on the mother or of a cord Wassermann test In 1946 a prenatal blood Wassermann was found to be 4+, and the patient was treated thoroughly throughout her pregnancy for syphilis She gave birth to a normal baby, and the cord blood gave a positive Wassermann reaction Should this patient be treated for syphilis throughout the remainder of her pregnancy? If so, suggest drugs dosage and interval of treatment*

M D , Pennsylvania

Answer —Whether this patient should now be retreated for syphilis, in view of the fact that she is five months pregnant, depends in part on the character and amount of antisyphilitic treatment given in 1946 and in part on the patient s clinical and serologic status at the moment According to Goodwin and Farber (Necessity for Treatment of Pregnant Syphilitic Women During Every Pregnancy, *Am J Syph Gonor & Ven Dis* 32 409, 1948), 'It is not necessary to administer antisyphilitic treatment to a syphilitic woman during every pregnancy, there is a high degree of probability that the infant will be normal if maternal treatment is withheld (*a*) regardless of the stage and duration of syphilitic infection in the mother at the *time of her original diagnosis and treatment, and (b)* regardless of the interval between the previous treatment and the pregnancy in which it is contemplated that further treatment be omitted, *provided that (a)* the mother has previously received 4 0 gm or more of arsphenamine (or its arsenical equivalent) together with concomitant bismuth, or 2 4 or more million units of penicillin and whether this previous treatment was administered during the previous pregnancy or during a non pregnant interval, and that (*d*) the mother shows no clinical signs of active syphilitic infection, and that (*e*) the mother is seronegative (blood STS) or, if still seropositive, in low titer only (1 to 8 dilution units) A syphilitic woman should be further treated in any pregnancy in which she herself shows clinical evidence of active syphilitic infection, or in which, in the absence of such clinical evidence, she herself has a positive blood STS in a quantitative titer of 16 or more dilution units "

These conclusions were based on a study of 570 pregnancies in 363 women who had previously been treated, but in whom in the 570 pregnancies in question, further treatment was purposely omitted The above data indicate the necessity for determination of the clinical and laboratory status of the patient in question Is she free of clinical evidence of syphilis? What is the quantitative titer of her blood serologic test? With this information a decision as to further treatment can be reached If additional treatment is desirable, it may now be given with procaine penicillin in oil plus 2% aluminum monostearate, given in 10 individual muscular injections of 600,000 units each, to a total of 6 million units These injections may be given daily or every second or third day

The query suggests that further information is desirable in this situation from the standpoint both of the patient herself and of her family It is stated that in 1941 and in 1943 she gave birth to a normal baby This statement implies that these two children have now been examined and have been found to be free of congenital syphilis, although this is not definitely stated If this is the case, it is again implied that the patient may have been infected between 1943 and 1946 Nothing is said of the examination of her husband, and, if this has not been done, it should certainly be done now It is further stated that in 1946 She gave birth to a normal baby, and the cord blood gave a positive Wassermann reaction ' This fact does not establish a diagnosis of congenital syphilis in this infant, and the child should be further studied from this point of view

Finally, there is no mention as to whether the mother herself has had her spinal fluid examined, if she has not, this should certainly be done

NONFATAL CARDIAC RUPTURE

To the Editor —*A colleague told me of the following case, which was quite startling The patient was a middle-aged white male who had the typical clinical course and electrocardiographic findings of acute myocardial infarction The course was stormy The patient went into peripheral circulatory failure during the first day or two but survived and congestive heart failure later developed About the second week, he showed signs of an acute cardiac tamponade Pericardial aspiration yielded pure blood, and a rather large amount was withdrawn During the next few days subsequent taps also yielded large amounts of blood The patient eventually recovered and is now working without overt evidence of cardiac failure The physician who attended the case feels that the patient suffered a rupture of the heart, with the small communication between the ventricle and pericardial cavity eventually healing Is it possible that nonfatal cardiac rupture can occur?*

M D Tennessee

Answer —Rupture of the ventricular wall occurs in a small number (5 to 10%) of patients with acute myocardial infarction As a rule, in such cases death comes quickly with tamponade Recovery must be extremely rare However, it may not always be possible to identify the cases in which this happens, although, of course, if there were much blood in the pericardial sac it should be easily identified, as in the case recorded here Since the tract of perforation is often very tortuous and small, it is not impossible that bleeding may cease and that recovery may take place without any therapy at all other than rest With rupture of the heart by trauma, repair has been effected surgically, but, in the case of acute myocardial infarction, this would presumably be difficult or impossible both because of the hazard of the surgery and also because of the friability of the damaged heart muscle

Other causes for the pericardial hemorrhage (and it seems certain that the blood was removed from the pericardium and not from the heart) are much less likely These include hemorrhagic pericarditis associated with infarction of the pericardium itself and a dissecting aneurysm of the coronary artery with rupture into the pericardium

MIGRAINE

To the Editor —*A patient says that two of her friends have received intramuscular injections of their own urine as a therapeutic step for the treatment of migraine Although the procedure appears to me idiotic I must have some plausible answer to satisfy my patient*

Ralph I Mitchell M D Vineyard Haven, Mass

Answer —There is no reason for supposing that giving a patient injections of his urine would help his migraine

FIBROSITIS AND WEATHER VARIATIONS

To the Editor —*With respect to the query concerning 'chronic lumbago sacroiliac neuritis, and fibrositis of the cervical vertebrae (J A M A July 28 1951), the difficulty in answering this is the fact that none of these is a recognizable clinical entity any more than neuralgia' or muscular rheumatism As to the relation to meteorologic changes I think it was Sir Robert Jones who said that during barometric changes there are changes in blood pressure generally and that in scar tissue the result of trauma or inflammation the arterioles are hemmed in and cannot respond by vascular dilation and contraction commensurately with those in normal surrounding tissues The immediate local disparity in pressure causes pain that goes away with elimination of the disparity which is hastened by soaking the affected part in hot water or, better, by contrast (hot and cold) plunges Theoretically, if the patient is free from pain in hot weather, good advice might be to seek a climate where it is always so, assuming in light of vague diagnosis and "chronic fatigue' that amebiasis and brucellosis have been ruled out*
